AT a special meeting of the Common Council, held at Guildhall on Saturday, the Lord Mayor presiding, Mr. Vallance, Chairman of the Bridge-house Estates Committee, presented report from them, calling the attention of the Court to a Bill now being promoted in Parliament by the London, Chatham, and Dover Railway Company, which contemplates the removal of the flight of stairs leading to the Thames on the east side of the south end of Blackfriars-bridge, and the appropriation of the space in front of Albion-place abutting upon the bridge. The report stated that the Committee had had an interview with a deputation from the railway company on the subject, and particularly with respect to the road and footway in front of Albion-place, which the company are seeking power to appropriate for the purpose of a railway station. At that interview the Committee urged that it would be for the public interest that the space in question should be kept open, as at present, as affording a convenient and ornamental approach to the bridge from the south, and a proper means of access to the river by the stairs. To that proposal the deputation declined to accede, and hence the Committee now recommended the Court to petition Parliament against the Bill. Mr. Vallance, in moving the adoption of the report, urged that it was the obvious duty of the Corporation to resist the proposed interference with a part of their property which it was so desirable to preserve intact, having regard to its value as an approach to the new bridge at Blackfriars now in contemplation. He added, as another ground for opposition, that the company proposed to cross Holland-street, Blackfriars, with four lines of railroad on the level, which, he submitted, was an arrangement fraught with danger to the public. He took occasion to correct a rumour for some time current, to the effect that the Thames Conservancy Commissioners and the Board of Admiralty had approved the design of the bridge which the London, Chatham, and Dover Railway Company were empowered to construct across the river at Blackfriars. It would appear, he said, that at one time, when the company contemplated the erection of a nine-arched bridge there, the Conservancy Commissioners approved the plan; but afterwards, when the company changed their minds and proposed to construct one of five arches instead, no such approval had been given either by the Board of Admiralty or the Conservancy Commissioners to the latter proposal, and that he stated on the authority of Mr. Holroyd, the secretary to the company. Mr. Vallance added, it was much to be lamented that the Corporation had to take a part antagonistic to any great enterprise, but no public body could allow such an unjustifiable intrusion on their public and private rights as the Bill in question sought to effect. Mr. Barnes commended the report of the Committee, and stated that the inhabitants near the south end of Blackfriars-bridge were also petitioning Parliament against the encroachment. Mr. Hartridge said at the recent half-yearly meeting of the London, Chatham, and Dover Company very bitter complaints were made by Sir Morton Peto and others of the impediments which had been thrown in the way of the company's bridging the Thames by the Corporation, and of the consequent loss and inconvenience to which they had been put. Mr. Vallance said the delay was owing, not to any act of the Corporation, but to the company themselves having changed the plan of their bridge from nine arches to five, and to their not having received either the sanction of the Admiralty or of the Conservancy Commissioners to a bridge of five arches. He added that the solicitor of the company had just addressed a letter to the Remembrancer stating that they were prepared to construct a bridge of three arches. The Court passed a resolution agreeing with the report of the Committee.

RUGBY WATER SUPPLY.

THE Rugby Board of Health is seriously embarrassed by the discovery that a plan which it has pursued for four years, and upon which it has spent £4,000, for supplying the town with water, has irremediably failed. The increasing population of the town has for a long time made the scanty supply of water at present obtainable a growing inconvenience, and Mr. Hawkesley was called in to advise the board. That gentleman gave his decided opinion that the river Avon was the only source from which an adequate supply could be obtained. But the opposition of the neighbouring owners of water-mills and other difficulties, on the one hand, and the narrowness of the powers at their command on the other, determined the board to look elsewhere for the desired supply. Mr. Hawkesley was induced to suggest that relief from their difficulties might be found by boring down to the water-bearing strata of the new red sandstone. The boring has reached the water-bearing store of this formation, but it has also reached a deposit of rock-salt, the existence of which was wholly unsuspected, and the salt dissolving in the water brought up by the bore-hole, communicates to it a degree of brackish salinity which renders it totally unfit for food, as well as for all ordinary domestic purposes. From an analysis of samples which have been successively taken, it appears that the salinity has steadily increased, until in the last specimen there were found 1,256 grains of saline matter in the gallon of water. Further boring into the salt bed would probably increase the saltiness of the water to the degree which would make it available as a brine spring for salt works; or if the boring were continued to the next formation—the permian—it is not improbable that abundance of good water would be found, but this stratum lies many hundred feet below the bottom of the bore-hole, and could only be reached by the adoption of a costly apparatus, and the expenditure of a considerable amount of time and money. For the water which they so much need the Rugbians must now look elsewhere, probably to the Avon, to which they must have a better right than the millowners.

THE CURATORSHIP OF THE SOANE MUSEUM.—The trustees of the Soane Museum have come to a very singular conclusion. Having refused to adopt Mr. Bonomi, the curator appointed for them by the Royal Academy, they have appointed as their temporary curator, in his stead, the very same Mr. Bonomi. Plain persons will be puzzled to understand such a course, which has been rendered necessary, we believe, by the perversity of the very trustees who represent in Lincoln's-in-fields the academical body. We can hardly think the Royal Academy will let the matter rest where it now stands. Their right to elect a curator is, in fact, set aside, and that not by the general body of trustees, but by the particular members whom they have themselves sent to the Board. The liberal and non-academical members thought the Academy's choice a good one, and sought to ratify it.—*Athenæum*.

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post*. Gold watches, 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enable persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 and 34, Ludgate-hill, 46 and 47, Cornhill, London, E.C. Established 1749.

ECCLESIASTICAL DILAPIDATIONS.

THIS subject, always of some importance, claims the especial attention both of dignitaries and of every holder of a benefice (to which a building of any sort belongs) at a moment when the management of ecclesiastical dilapidations is under legislative attention, and changes are foreshadowed in the conditions upon which Church temporalities are enjoyed.

Incumbents have hitherto stood in the position of tenants for life, being only prospectively amenable as trustees for the due conservancy of their estates, but, by the Ecclesiastical Dilapidations Bill, brought before the House of Lords last session, and to be prosecuted in the present, the system of self-management is to be replaced by constant official control.

Among the things it is desirable to set at rest with regard to ecclesiastical dilapidations is, their proper extent, a point upon which surveyors have shown great difference in practice, and judges have held equally varied legal views; but no attempt is made to close this question by any definite provision in the Act.

If the term dilapidation were taken in the widest sense of deterioration, a sinking fund would be necessary to meet the ultimate state of decay into which every building must eventually and inevitably fall; but the clergyman's responsibilities are practically limited to such restorations and repairs as would be exacted from a lessee subject to repair only and not to rebuild, for when that duty devolves upon an incumbent recourse is generally had to Queen Anne's Bounty, and the living mortgaged for many future years.

The moderate sum obtainable from the bounty shows, however, that it is to be regarded as merely meeting the extra expense of rebuilding, with the improvements of the period, an edifice reduced to the last stage of dilapidation, which the incumbent is personally bound to render substantial and complete. It is a condition, indeed, that the sum advanced by the governors shall be deemed supplemental, and be laid out after the value of the dilapidations has been expended.

By this arrangement the work of repair and renewal falls with equal pressure upon every holder, and though the general renovation occurs only at distant periods, the duty of reinstatement, as particular portions of buildings fall to decay, is never relaxed.

It has been sometimes considered that internal painting, paper-hanging, and distemping are to be regarded as of the nature of cleansings, and therefore not properly subjects of assessment; but it appears more reasonable that things without which no house would be finished, and which must, therefore, be included in a new building, should be thenceforth maintained.

In more than a hundred cases of episcopal and other residences erected within the range of my observation, the specifications always provided, in addition to internal painting, papering, &c., chimney-pieces, grates, bells, and such fixtures as are of permanent necessity, and not dependent on the taste of any particular occupier. This seems a safe criterion in new edifices, and also where a continuing charge is instituted for repairs; but it should not be strained beyond the proper limit, or to the prejudice of the rule, that incumbents are not called upon to originate but only to maintain, repair, and reinstate whatever has once existed. Thus, a chancel in the diocese of Winchester was surveyed with, the twofold object of assessing the dilapidations and of putting the edifice into a state of completeness. There was a considerable difference between the two estimates, because the first had reference to maintenance only, while the other embraced improved constructions and new, though necessary and appropriate, features.

Next to the nature and extent of dilapidations may be considered the times appropriate to their investigation, and any change in the old rule, which marked avoidances as the proper occasions, would trench upon the privileges of incumbents, while, if properly and systematically observed, the settlement of accounts at each change of stewardship would secure most of the expected benefits without affecting the independence of those concerned.

It does not seem an improper requirement, however, that every incumbent, upon taking possession of a benefice, should cause the dilapidations to be assessed, and deposit for application to its special object the money obtained from his predecessor in respect thereof.

The person best suited to make the valuation would be a surveyor nominated by the entering incumbent, and if also confided in by the previous holder of the living there would be a simplicity of operation and a saving of expense; but in cases of dispute the appointment of an umpire might be properly left to the bishop.

This would be, in some respects, preferable to the appointment of diocesan surveyors—would relieve the bishop of needless responsibility, and leave the body of experienced surveyors undisturbed in their vocation. But even should the appointment of such officers be determined upon, it may still be a question whether the Act should come into effect in any benefice until after the occurrence of one avoidance.

A subject upon which the united action of the clergy seems capable of being exerted with beneficial results is a modification of the custom of insurance against fire, which the provisions of the Bill render compulsory. In a case where I became trustee, some premises had been insured for seven years, and the premium paid down; but at the end of the term I was agreeably surprised at receiving back the whole amount by way of bonus, as the losses and charges of every kind had been met by the mere usufruct of the money. This circumstance has led me to conceive that a restoration fund might be usefully instituted in each diocese, presided over by the bishop and governed by the dignitaries. The ordinary insurance charges would possibly produce a fund equal to all purposes of restoration.

In the event of buildings being destroyed by fire the advances should be free, while in other cases loans might be made at a moderate rate of interest.

Practical information calculated to impart a sound tendency and lasting basis to the Bill is no doubt at command, and with that object, rather than from attaching much value to these remarks, I submit them to perusal.

THOMAS MORRIS.

SOUTH KENSINGTON MUSEUM.—During the week ending 1st March, 1862, the visitors have been as follows:—On Monday, Tuesday, and Saturday, free days, open from 10 a.m. to 10 p.m., 12,441; on Wednesday, Thursday, and Friday, students' days (admission to the public 6d.), open from 10 a.m. till 5 p.m., 1,252. Total, 13,693. From the opening of the Museum, 2,522,718.

ART IN CONNECTION WITH MANUFACTURES.

THE Rev. Charles Boutell, M.A., lately delivered a lecture at Sheffield on "Arts, Education, and the value of the Arts in Practical Connection with Manufactures." A considerable portion of the address was devoted to a consideration of the progress that has been made in the application of art to manufactures since the first Great Exhibition, and the probable position of Sheffield in the approaching Exhibition. During the eleven years which have elapsed since the great meeting of producers from all parts of the world in Hyde-park, a vast change had been made in the relative condition of art and manufactures. The two primary questions of economy and utility have now associated with them a third—the question of adornment. It is recognised as a great axiom that we must have beauty in our works, in order that they may be perfect. Not only must a part of anything be beautiful, but the whole. Its beauty must grow with its growth, as the beauty of a leaf grows with the growth of the leaf; and, arguing from this proposition, he contended that in order to realise true excellence in our manufactures, we must not be content to allow one man to make an article and another to decorate it, but must so train up our workmen that he who produces the work, though not himself actually producing its decorative qualities, may be capable of producing and appreciating them. Our workmen must be artist workmen. The deficiency in that important requirement, which was discovered in 1851, had led to the establishment of the South Kensington Museum, and of Schools of Art in connection with it all over the country. He did not enter into the general question of what these schools have been doing for the country, because the results of their operations will be proved to demonstration in a short time, when the Exhibition opens; but he discussed at some length the point whether Sheffield had properly appreciated the importance of art in connection with manufactures. He thought that in no town in the empire was that point of more importance than in Sheffield, since it is threatened with a very severe and resolute competition by continental manufacturers. During the last eleven years, the hardware productions of England, especially cutlery, have been looked upon with very jealous and envious eyes by the skilled craftsmen of the continent; and there has been a cherished desire and intention to beat England on her own vantage ground in the manufactures in the metals. Of course we, as a nation, are not prepared to allow ourselves to be beaten; but, in order to maintain in 1862 the supremacy of 1851, we must show that we have made vast improvements upon the excellence of past days. Starting from the point we reached in 1851, we must adduce proofs of substantial progress, or we should find that the advance of other nations has left us very much in the rear. The great question, therefore, is, have we been working on such a system as will enable us to look forward with confidence to satisfactory results? and in order to answer this question, we must inquire into the agencies which have been at work amongst us. Mr. Henry Cole, the head of the Department of Science and Art, at a recent visit to Sheffield, extolled very highly the progress which was visible from the operations of the Sheffield School of Art; and his expression of satisfaction, taken by itself, was certainly sufficient to dispel all anxiety as to the future. But the question arose, were Mr. Cole's opinions the result of such a sound consideration and judgment of the case as to be conclusive? Unfortunately for those who maintained that because Mr. Cole said so there need be no fear as to the future, that gentleman had given an opinion upon another branch of art—namely, architecture. At a recent meeting of the Society of Arts, Mr. Cole said, in the most explicit manner, that the body of architects were a set of ignoramuses, that there was but one great architect, and he a captain of military engineers, and that the building which he has designed to contain the Exhibition is one of the finest, if not the finest, building that ever was produced in the world. He (Mr. Boutell) held, on the contrary, that that building is an outrage to architecture and a disgrace to England. There is not a railway shed that ever was built that is not as fine a work. It is simply like a carpenter's shop magnified to a large extent, with no design or ornament or good point about it whatever. This fact brought home to his mind the serious consideration whether Mr. Cole might not be equally mistaken when he said that the Sheffield School of Art was doing all that could be desired. He urged upon his hearers the necessity of careful study of the principles of art, so that they might become not mere copyists, but original thinkers, able in the highest walks of art to maintain the supremacy of their country. He had seen much in Sheffield to convince him that the progress which had been made was not so great as he had hoped it would be. Our manufacturers and designers had expended great skill and patience and emulation in merely copying works that have been designed and thought by other men. They must become original thinkers, capable of carrying out their own designs, if they wished to keep ahead of their competitors.

ARCHITECTURAL DRAWINGS FOR THE INTERNATIONAL EXHIBITION.

THE honorary secretaries of the Institute of British Architects have received an intimation that drawings and models in Class 37 will be received at the Exhibition Building from the 20th to the 30th instant, instead of from the 1st to the 8th as originally intended.

THE BOYNE VIADUCT.—According to the report of the Dublin and Belfast Junction Railway directors, the extensive works which Mr. Hawkshaw recommended for the Boyne Viaduct, to insure the permanent stability of that structure, have been completed in a substantial and durable manner.

PARAFFIN OIL.—A series of interesting and important experiments have been recently made on mineral oils. From these it appears that no danger can arise from the use of paraffin or coal oil if it be properly refined. To ascertain whether this necessary process has been effectively performed, it is only necessary to place the oil in an open dish in a water-bath, and heat it to a temperature of 130 degrees. If, when elevated to this heat, it does not ignite by the application of a match, it is safe; but any oil igniting at a temperature below 130 degrees is dangerous, and should not be used for domestic purposes. As an example of the extremely dangerous nature of some American rock oils, sold as paraffin, it is stated that samples purchased in shops have exploded at the temperature of 46 degrees.

SURFACE DECORATION.*

IF I were to call your attention to the thousand-and-one different ways of ornamenting a surface, I should far overstep the limits of a paper, and, perhaps, your patience. The subject is so extensive that I fear much will not have the attention its importance demands; indeed, I have been sorely puzzled to define its limits, and feel myself so unequal to the task of describing its varied application, that I must ask your indulgence for shortcomings and omissions in the short and consequently incomplete form of the subjects alluded to. However, I have endeavoured to bring before you, with as much interest as I could gather, the several productions of the artist and manufacturer, and that which I trust will not prove the least interesting is the different means employed in producing the results we so frequently admire without being acquainted with the difficulties of their fabrication. Firstly, I will briefly allude to the ruling principle of form and colour, and its application to the different materials used for external work, such as bricks, terra cotta, the several kinds of tiles, &c., &c. The more costly marbles and their imitations, grained work, and the different decorations as applied to stucco, also to interior work in general, whether local or applied. Mosaic will also find a passing notice.

We must all agree to the universal feeling in every clime and age to imitate and beautify—whether we instance the gaily striped of tattoo of the wild Indian, or the more refined touches on the cheeks of a modern belle; indeed, it seems a passion so inseparable from man, and so necessary for the development of his faculties, that it would appear to be the earliest if not the first attempts at order and civilisation: these being established, something more than mere usefulness is required to satisfy the mind's necessities; soon the feelings of a refined age grow weary of a crude utility, and man is urged to a higher and nobler sentiment—to develop the beautiful, to provide a necessary as essential as food for the body.

The proper application of ornament has of late received more of that attention and care necessary for the development of true art principles; it is too often left to the whims and fancies of an untutored workman, partly from indifference on the part of the architect to minor details, and not unfrequently his inability to guide; hence we frequently meet with ornaments in the most unfortunate positions, and as inconsistently placed as they are contemptible in execution. A just appreciation of design and ornament will be sure to lend to its appropriate use, for without some acknowledged canon of perfection to enable us to select the beautiful and true from the meretricious and false, we can never hope for much progress in rendering the adaptation of art consistent with the requirements of the age. It is highly necessary that the difference between design and ornament should be thoroughly understood: design has reference to the construction of any work both for use and beauty, and therefore includes its ornamentation also. "Ornament" is merely the decoration of a thing constructed—(Redgrave on Design); it cannot, therefore, be otherwise than secondary, and I must not usurp the place of a principal, or the object is degraded into a mere ornament, and is a sure sign of declining art and social life with it.

Ornament is generally divided into two classes—the symbolic and the æsthetic. The former includes the representation of all objects which appeal directly to our understandings, and have a figurative sense peculiar to the object symbolised, the meaning of which is supposed to be understood. It is regulated by prescribed rules. Such is the early Egyptian, where every vestige of feeling for the beautiful was crushed by a priestly symbolism, which precluded the natural representation of living things, and visited the poor slave of an artist, should he deviate from their acknowledged canons of decoration, with a merciless punishment. I think there is much in the symbolic representation of ornament that is well worthy of our study, and the fact of its being an essential feature in every epoch of art, particularly the early Christian, should give it a positive claim in our education. Whenever symbolic ornament is used it must be subject to the ruling principles of design as ornamental art, or however ingenious the combination of forms used, unless strictly conventional, it certainly cannot meet the requirements of good taste. Æsthetic ornament is quite another character: in the former it was the work of the artist to convey an acknowledged meaning; in the latter the object is to produce a pleasing effect on the mind. Hence it is unlimited in its resources, and depends entirely on the artist's capabilities, his appreciation and embodiment of what is pure and beautiful. The beautiful arrangements of form and colour which nature has profusely scattered over the earth are at his disposal, but he is not to take from this vast treasury of art her valuables, and indiscriminately appropriate them according to his unguided fancy, or art will always be in its infancy; or to treat with indifference the labours of those noble men of art of all ages, whether Goths or Greeks, is a sin not to be tolerated at the present day. If we analyse the manner in which the distinguished men have selected and treated their selections from nature, we must at once come to the conclusion that all natural objects represented in decorative art to meet the requirements of good taste must be conventional; that is, the geometrical forms of the plant or object represented are so arranged and frequently connected with other geometrical forms that the natural order of its development is lost, yet the general feeling and characteristics of the object conventionally should be preserved. With natural imitations it is the contrary: the detail, mode of growth, and every peculiarity that marks its development is represented; this species of ornament, so fascinating and dangerous to true principles, can never rank higher than mere imitative art, and cannot be valued for the amount of mind bestowed upon its production, but solely for the dexterous manipulation it exhibits. Considering this naturalistic treatment in relation to our subject, a few examples will be sufficient to demonstrate its absurdity. We will begin with the paper-hanger's most marketable effects. The most distant lands appear to have been ransacked for the largest specimens of botany to be found; here we have passion-flowers in torture, twisting and clinging to endless stalks that lead Heaven knows where; bunches and festoons of flowers of every conceivable shape and colour, all tending to destroy the idea of flatness a wall or similar surface should convey. Ay, and as Owen Jones observes (in his excellent little book on the Application of Colour), "we have ladies' dresses, ribbons, prints, furniture, and carpets, which are more and more admired from the more perfect knowledge of botany they display, violating the sense of propriety. At every step we walk on flowers and tropical plants crushing beneath our feet; we have chintzes covered with roses in violent contortions over the sinuosities of our furniture, or broken in twain by the folds of curtains; ladies robed in rose, shamrock, and thistle (a high achievement); the fast man with race-horses and ballet girls printed on his shirt, and pointers worn on his neckerchief. So runs the fashion of the present day; would that its sun were set that we might awake to a more healthy dawn."

It is with great unwillingness I dismiss the highly interesting and important subject of form with so brief a description; my space, however, compels me to pass on with a somewhat similar sketch on colour. The same rule applies to colour as in form. All objects, whether selected from nature, geometry, or the creation of the artist's fancy, when used as a surface decoration of any kind, should be treated in the flat, that is, without giving it the representation of light and shade, otherwise it is no longer a legitimate ornament, but a counterfeit, and however beautiful it may be as a picture it cannot be tolerated as an architectural decoration; it then (if positively demanded) must be treated as a picture, and separated by a panel or otherwise from the essential features of a constructional or rational decoration. I cannot feel that the science of colour as at present advocated is sufficient to demonstrate the harmonies and pleasing contrasts that abound in the works of nature; an attentive observer will find many contradictions not easily explained; and certainly Oriental artists, who have produced designs which in delightful combinations of colour surpass all others, knew nothing whatever of the modern theory of colour. However, "it is not for us to destroy the scaffold until we have finished the building" (of our education). These rules, crude and dogmatical as they appear, have certainly much in them to be valued, if they do but lead us to search for the more subtle beauties that colour everywhere reveals. Do not understand me to infer that they are insufficient to explain much that without them would be a mystery; what I mean is, they cannot prevent the talented and educated artist, with a good eye and instinct for colour, producing harmony without them, and not unfrequently in opposition to them. We are not all gifted with the same physical endowments that enable us to appreciate the charms of colour, and need some guide to direct our wanderings, to lead us to a better result than trusting a faulty nature. We find a great partiality among the uneducated in art for colours easily recognised, as we find in form the preference generally given to direct imitations from nature; however absurd the application, they will be sure to attract the ignorant, while a good and modest design, kept subservient to the object decorated, is treated with indifference; so the child

or barbarian is more taken with that his capacity will allow him to understand than with the matured reasonings of an accomplished mind. To proceed with the more immediate subject of colour, we find that the countless hues of nature are reduced to three primitive colours,—yellow, red, and blue; these are supposed to neutralise each other, or produce black, in the proportion of three of yellow, five of red, and eight of blue. It is considered that because they neutralise each other in those proportions they will also harmonise by arranging them in superficial quantity and intensity at the same ratio, which is well known to be the case (probably as much by accident as anything else). If we mix two of these primaries in the proportion of their figures, the secondary colours,—orange, green, and purple, are produced; and by adding the figures of the two primitive colours mixed we have the proportion of surface required to harmonise with the remaining primary, which is, therefore, called its complementary; thus, three of yellow with eight of blue gives eleven for green, its complementary being red, five, forming a well known harmony in those proportions, and so on with the other secondaries, orange harmonising with blue, and yellow with purple. To produce the tertiary colours, citrine, olive, and russet, we mix the secondary colours in like manner; thus, the two secondaries, orange and green, produce citrine, which harmonises with its complementary, purple; the same with olive, formed of purple and green, harmonises with its complementary, orange; or, russet, of orange and purple, with green. Hues of colour are reformed by mixing the primaries or their nearest representation; these when mixed with black are called shades, or, with white, tones or tints. Much might be written on the nature of contrast and harmony of colours entirely independent of what is considered good taste and fine feeling for colour. Education and practice has taught many of us to place colours in juxtaposition, or side by side, so as to form grateful and pleasing impressions on the mind, while science has unfolded many of the laws which influence them; and to no man of modern times is more commendation due than to the distinguished Frenchman Chevreul for his high scientific attainments and thoroughly practical reasonings and conclusions; they are to be the more valued from his position enabling him to practise on an extensive scale the precepts he has given, with what results all Europe can testify. The properties of contrast, taken generally, may be divided into three distinct effects—firstly, light with dark colours, as yellow, the lightest of all colours, with purple, the darkest; they are also complementary to each other, therefore contrast and harmonise—secondly, contrast of hue, as red and green, which are non-contrasting as to light and dark, but powerfully striking in their hue, being complementary also to each other they harmonise; and lastly, the contrast of warm and cold colours, as blue, the coldest and most retiring, with orange, the warmest and most advancing, these are complementary and consequently in harmony.

There are singular and extremely interesting modifications of these contrasts which deserve the most attentive study. A keen observer will discern something more in the juxtaposition of these colours than simple contrasts. The discoveries of Chevreul on this subject, which he has named "the law of simultaneous contrasts of colours," explains the following phenomena:—Firstly, if two tints of the same colour be juxtaposed, an apparent difference of colour is observable at the parts in proximity, the light tint will appear lighter and the dark tint darker; this is called the contrast of depth. Secondly, if two hues be similarly placed, they receive a double modification—firstly, the light colour appears lighter and the dark colour darker; secondly, as to their hue, each colour becoming tinged with the complementary colour of the other; this is called the contrast of hue, and is explained by the colours reflecting with their own proper hue a portion of the complementary rays, and of white or undecomposed light. Thus we contrast the complementary colours, purple and orange—the purple reflects with its purpleness yellow rays (its complementary), which are scattered over the yellow at their junction, which gives it a deeper yellow; and the yellow, in like manner emitting purple rays, darkens and enriches the purple. In opposition to this, now, if blue be placed on a purple ground (not its complementary), the blue will be sullied by its neighbour, and appear greenish, while the purple is dirtied in the direction of russet by the orange complementary rays from the blue; both colours are thus injured in brilliancy, and do not harmonise; hence we may infer that complementary colours in juxtaposition mutually enrich each other.

The infinite appliances of colour to the different forms and surfaces of a building afford the architect such a fruitful source of variety in design, without interfering with the general forms, that its study and application cannot be too forcibly impressed. An agreeable colour imparted to a beautiful form cannot fail to add more beauty to it as a whole, without detracting from the original. If we, instead, clothe it in a disagreeable, unsightly colour, it will not only be unpleasant to view, but its form will suffer much from its unbecoming associate: we may conclude, therefore, that appropriate colours assist a beautiful form; it not only does this, but enables us to distinguish the variety nature everywhere presents us, which otherwise would be mingled in the utmost confusion. The use of primitive colours is generally considered a vulgarism, and doubtless so when used in large masses. Again, what does nature teach us? Here see with what a sparing hand the little dots and spots of positive red, yellow, and blue are distributed to heighten the more sober hues, and prevent insipidity and sombreness, without destroying the harmony with a mass of glaring colour. I cannot feel that the introduction of applied colour on the exterior of our buildings can ever meet the requirements of the present day, and I hope, for one, it never will. It would be painful, indeed, to see the tawdry yellows on every advancing series of mouldings, because it is an advancing colour, and the hollows painted blue, because it is a retiring colour, while red must be in shadow to check its positive nature. This is the mere accommodation of art to theory, which in practice would be intolerable. There is much difference of opinion on this subject, and frequently much valuable time is wasted on fruitless arguments as to how much or how little of this or that ancient building was embellished with surface ornament. We have positive evidence it was as general for them to apply colours to their exteriors as well as their interiors; that it also met the approval of their most critical and accomplished artists we have abundant evidence; and, lastly, that their sensibilities, climate, and tradition in every way assisted the natural instinct for colour and surface ornament peculiar to all Eastern nations; and I need only refer to the Exhibition of 1851, and the scientific reports emanating therefrom, to convince you how vastly superior they are in the treatment of ornament and arrangement of colour (barbarous as we may consider them in other respects), not only to us, but to all Europe. Their designs exhibit the most beautiful and elaborate conventionalism in the adaptation of natural objects, and the harmony of their colours can satisfy the most fastidious critic. Here, then, may we study from a fruitful source, and find those good elements of decorative art and taste that appear inseparable from the Eastern mind; may it not be the remnants of that high æsthetic feeling handed down to them from age to age, which their indolent and non-progressive character has preserved for admiration and, I trust, our benefit.

Our subject, taken in a general manner, resolves itself into two sections: one in which the natural colour is inseparable from the material used; the other where colour is applied to impart that pleasure so congenial to our senses, independent of its protective utility. In the first instance, the employment of brick to the exterior of our buildings, by its general use and adaptability for London elevations, claims our special attention, now that stone, it would appear, does not withstand our atmosphere ten years in a perfect state. It is a cheap and durable means of decorating the surfaces, and when judgment and taste is used in the arrangement of the different colours, very good effects can be produced. There is an instance not far from here, one of the most successful arrangements of bricks I have seen—the tower of the church in Margaret-street: the different coloured bricks are arranged on a red ground in bands; they are not so abundant, though, as to cut up the surface into unmeaning strips, but are well studied, and evidently the work of an artist. I mention this in opposition to the more discordant arrangements to be met with so frequently in London, such as the common buff grey etocks divided with black bricks in courses a little more than a foot high, ending up the surface in a very unsightly manner; the use also of the light red bricks and these stocks as a ground are also objectional, for the tones of the two colours are so alike that there is not sufficient contrast, hence an insipid, dull, and foggy appearance is the result; whereas, a little study in the arrangement of colours would readily assign each to its most telling position. We shall find, I think, that black will be too crude to separate somewhat of a grey or indigo cast, we cannot fail to observe that these colours not only contrast, but assist each other (bricks, I believe, are made of this colour now), and I fancy the effect would be more in keeping with the surface. The subject of brickwork affords so many points of interest, and is so closely connected with my subject, that I must ask your patience a short time longer, to consider a few suggestions for the use of it to more than

* Paper read before the Architectural Association by Mr. R. O. HARRIS.

ordinary buildings. The present dimensions, however useful they may be as wall bricks, and the many present applications that fix their size, would in many instances (to me) have a preferable effect exteriorly, particularly when applied to large buildings; if they were larger, the numerous mortar joints gave anything but the effect of strength and durability, and, moreover, are not at all interesting in appearance. We will imagine, then, the facing bricks only to be 9 by 4½, and one, two, and three bricks high, these will readily work in with the other bricks, and being made with all the modern improvements of colour, will afford, by their varied size, a field of unlimited resource to the architect; the larger ones may also be made one brick and a half long, three bricks high, and one brick wide; these also I would have V jointed horizontally, and, if possible, vertically, and may be very applicable for a large monochrome surface. I think much more may be done than has yet been attempted in the production of moulded brickwork, or even carving. I wish more particularly to call your attention to a kind of surface ornament that brickwork is capable of to a very eminent degree. Admitted that we have bricks with an external surface of 9 by 1½, or 9 by 9; this will afford us good space for a neat and appropriate ornament slightly sunk (stamped) below the ground, supposing of a red brick, it may then be filled up with another coloured clay after the manner of early encaustic tiles, and burnt, or, *vice versa*, the ground being sunk instead of the ornament, leaving an ornament in relief in one colour. There is another way in which these bricks may be ornamented very simply and economically, that is, to sink on the surface a simple geometrical panel, which shall be the type of a series to be continued as fancy may suggest in strings, pilasters, jambs, and even arches; this certainly would not have the effect of a mere decoration stuck on the wall, as the indiscriminate employment of tiles frequently suggests.

There is another material capable of a very extensive use, which for hardness and durability can defy the withering influence of even our destructive atmosphere; that is, terra cotta. It has been used in different parts of Italy as early as the thirteenth century, and adapted to the buildings of many distinguished architects subsequently. Its use in England until lately has been very limited, partly from a prejudice against the use of it, caused by inferior manipulation and inartistic modelling and production. In the use of this material an architect's knowledge of modelling and ornament will be found of the greatest value to him, for he will not only be able to embody his ideas at once in the clay, as easily as in the ordinary modelling clay, which may be hereafter fired when it is ready for firing. Certainly the numerous specimens exhibited at the Kensington Museum by Mr. Blanchard, of the Blackfriars-road, are sufficient to show its capabilities; there are margins on some of the works that have a sharpness and neatness of angle that would be impracticable in freestone work, and I may add that the artistic finish and colour of the several works exhibited show a perfection that must in time find a just appreciation. The predominant colours are red and a Bath stone colour or pale buff.

I may here mention that the columns, caps, and other decorations of the arcades in the Horticultural Gardens at Kensington are of this material; the shafts of the columns and caps are exceedingly elaborate in design. Specimens of these may be seen at the Museum. A sketch of the manipulation of this article from a pamphlet by Mr. Blashfield on the subject says:—"It is chiefly composed of clay, flint, glass, and fossils, containing phosphate of lime; these substances are crushed and ground to a powder, and passed through sieves, and when combined with as much water as necessary to form a paste fit for modelling or moulding, the compost is ground in a mill and afterwards beaten until all the air bubbles are expelled, which completes the first operation. When required for use it is bedded in sheets on a bench, and beaten to the consistency of putty and pressed by hand into the moulds; it is then left to dry a little, the mould is then removed, and the cast having sufficiently dried, is placed in the kiln and fired with a gradual heat until the object is partially vitrified, the kiln is allowed gradually to cool, and the articles withdrawn are finished, unless required to be painted or glazed."

The employment of granite, marble or freestone with brick, is a subject upon which so much has been written, and so ably, by a gentleman who has made it his particular study, that I cannot do better than refer you to Mr. Street's book for further particulars on this beautiful but costly style of embellishment.

I think if there is one style more than another in which material colour decoration of the exterior is in best keeping, the secular Gothic of many parts of Italy claims our special attention. I mention Gothic, because variety of surface seems so much more akin to it than the severer forms of Classic art. For my own part, I cannot see the impropriety that some antiquarians see, of engrafting an advantage of one style on another; I think it the only way of forming a complete style; however, this may raise the vexed question of style, which I must not enter upon here.

Encaustic tiles and their uses will be the next subject to consider. It has become very fashionable of late to introduce tiles of various descriptions on the exterior of buildings; many have certainly a very good effect, while others are anything but pleasant to look at, mostly by conveying the idea of security by having the positive appearance of being stuck on the wall, and not unfrequently with a diagonal joint, which is very objectionable construction, for a tile, even if it is a sham, should convey the idea that it is a portion of the wall, and if diagonal lines are necessary, they are certainly very simply affected on the tiles. I think they should not impress you that they depend solely upon adhesion for fixing, but should be encased where possible by a margin of some kind, so as to form, as it were, a sunk panel. It occurs to me that a grooved, moulded or splayed string of terra cotta, one or two bricks high, would form a very appropriate and economical fixing for horizontal arrangements. Their position will, of course, suggest their pattern and colours; the border tiles of a floor will frequently admit of the pattern being used in a vertical or horizontal position with very good effect. The varied productions of the several tile manufacturers claim our attention, from the ingenuity and perseverance bestowed on reproducing imitations of works that in ancient times were wrought to such perfection, such as the different kinds of mosaic pavement, of which more hereafter; we have all that fancy can desire, from the common red and black Staffordshire tiles to the beautiful imitations of the *opus tessellatum*, from the ancient encaustic to the painted and glazed porcelain tile, with all its varieties for mural decoration. I will here give you a short account of the different manipulation, in producing tiles.

The common red, black, and buff material known as Staffordshire paving tiles are so nearly allied to bricks, and suitable only for very common purposes, that it is unnecessary to class them with the superior kinds used for decorative purposes. The simplest and most approved plain tiles of different colours used for ornamental paving, &c., are those made from compressed porcelain material (a mixture of flint and fine clay)—"The substances are reduced to a fine dry powder, and in that state subjected to strong pressure between steel dies; the powder is compressed into about one-fourth its bulk, and is converted into a compact solid substance of extraordinary hardness and density much less porous and much harder than the common porcelain uncompressed and fired."—(Essay on "Mosaic Pavement," by F. O. Ward.) The invention is due to Mr. Prosser, and carried out by Messrs. Minton. The powders may be compressed in their original state, forming white tiles, or by admixture with material imparting the necessary colour, and may be cut of any shape to suit the pattern required; they are frequently made to represent the different kinds of mosaic work.

There are many imitative of a kind of mosaic work known as the *opus tessellatum*, or, as it is generally called, tessellated pavement; it is made by most of the tile manufacturers after their particular improvement, and generally consists of a rough earthenware ground, upon which is affixed the coloured porcelain material, arranged according to the design; they are then subject to a great heat, which renders them semi-vitreous, and exceedingly hard, while it brings out the colours to the tint required.

The next class of tile consist of those known as encaustic or inlaid tiles; in the manufacture of these none have approached the excellence of Messrs. Minton, in design, workmanship, or material. These are, perhaps, the first ornamental tiles produced in England, of which there are some beautiful specimens of the thirteenth and fourteenth centuries. They are made by pressing clay of the colour required for the ground into a mould, having the intended pattern raised; the tile being withdrawn, the ornament will be in *cavetto*, the intended pattern on the tile is then filled in with a coloured liquid clay; the surface having been scraped level, it is fired, and the colours are brought out to their proper tint. The better kinds of work are rubbed on the surface, which gives them a beautifully level and opaque surface.

The last my limited space will allow me to notice is the very extensive class of painted porcelain tiles, used mostly for mural decoration; in the Museum at Kensington are some

magnificent specimens of the applicability of these decorations to architectural purposes. The earthenware paste or plastic clay having been formed for the required size, it is laid aside to dry, and then fired for sixty hours it is allowed gradually to cool for two days, when it is withdrawn in the state technically termed biscuit, and is then ready for glazing; in this state the well-known colours of china are produced in the material, viz., white, drab, brown, blue, black, &c., &c.; the glaze is now applied, when no further decoration is needed. There are two ways of applying the coloured ornamentation on the surface—one by painting the surface before it is glazed with certain pigments, principally the oxides of the metals, producing certain colours; the article is then glazed and the whole effect produced in one firing; the other by using enamel colours, and is closely allied to glass painting—it may be termed enamel painting—by which works of greater delicacy and beauty are produced. The process is simply this—the article is supposed to be fired and glazed; this forms a ground upon which another coloured glaze is added, in parts requiring to be coloured. The colours are prepared from metallic oxides (as in the former case), and mixed with fluxes or fusible glasses. The colours are ground (with the fluxes) in essential oils or turpentine, and applied on the surface of the glaze; the article is then placed in the enamel kiln, when the colours melt and combine with the glaze; the flux is generally made of borax, flint, and oxide of lead. It may be interesting to know what colours the different oxides produce—oxide of gold produces the most beautiful tints of red; antimony, tin, and lead—yellow, cobalt, blue, iron orange, copper green, &c.*

HOUSE OF COMMONS.

TOWN SEWAGE.

In moving for a select committee to inquire into the best means of utilising the sewage of the cities and towns in England, Mr. BRADY said he wished in the first place to determine whether the sewage of our cities and towns was in itself a valuable commodity—that is, a commodity fitted for agricultural purposes. The next point to be considered was the best and cheapest means by which that commodity could be placed upon the land; and, thirdly, he desired to ascertain the value of this sewage. He wished also to bring before the committee the engineering difficulties which he was given to understand existed in the matter. The subject was one of great importance. It was a melancholy thing to see sewage constantly wasted which might be profitably employed in agriculture. The matter was worthy of consideration both on social and sanitary grounds. Mr. Wheatstone had laid it down that it was an engineering impossibility and a commercial impossibility to utilise sewage in a fluid state, and went on to say that the only way it could be utilised was by solidification. Professor Liebig had expressed an opinion that, if England intended to continue a great agricultural country she should apply herself to the problem of utilising the night-soil of her large towns. He held in his hand a series of calculations which had been made by several eminent men of science, doctors and chemists, all testifying to the great pecuniary value of the sewage of the country. One valued it at £15,000,000, another at £52,000,000, a third at £64,000,000, and Dr. Parkins, guided by the calculations of Professor Playfair, estimated its value at £93,283,000 a year. The figures might appear fabulous, but they were not his own. The hon. member next referred to the decrease in the yield of corn, and said large tracts of land had been abandoned because of the inability to restore its productiveness. It was supposed that the supply of guano would not last more than twenty years, and the time was come for providing a substitute.

Mr. COWPER said the utilisation of sewage, and the removal of it from the towns for the purpose of agriculture, had long been a subject of interest to boards of health. The late Board of Health had made a very valuable report upon it, but little progress had been made; for although the sewage of small towns could be advantageously applied to agriculture, as was seen by the examples of Rugby and Watford and Edinburgh, yet, as regarded large towns, engineering skill had failed in finding a satisfactory system. He was not sanguine that an inquiry would lead to any great advance in this branch of engineering and sanitary knowledge, but he should not object to the appointment of the committee. He hoped the examination of persons interested in the subject might throw some fresh light upon it, and the labours of the committee might not prove fruitless.

The motion was then agreed to.

WESTMINSTER BRIDGE.

In reply to a question as to when Westminster-bridge would be completely open for public use, and when the houses on the south-side of Bridge-street would be removed; and whether there was any objection to a carriage entrance from the foot of Westminster-bridge to the House of Commons: Mr. COWPER said, judging from the present state of the works at Westminster-bridge, I think there is every reason to hope that it will be open for public use early in the month of May. The houses on the south side of Bridge-street are pulled down as they come into the possession of the Office of Works. I am not able to state any precise date at which the whole of that number of houses will be in our possession. With reference to the proposal that carriages shall be allowed to enter New Palace-yard from the bridge, I can only state that when the ground has been levelled which was previously occupied by the houses near the Clock Tower there will be no difficulty, as regards the ground, in admitting carriages. Whether it would be convenient to do so, as regards the approaches to the Houses of Parliament, is a matter on which I should be anxious to consult you, Mr. Speaker, before giving any answer.

COPYRIGHT IN WORKS OF ART.

The SOLICITOR-GENERAL has moved for leave to bring in a Bill on this subject. Having shown what was the present state of the law of copyright, he said the object of the present measure was to give copyright in paintings, drawings, and photographs. The copyright would last for life and seven years afterwards. With regard to the question between the author of a work and the purchaser, it was provided that the purchaser should have the copyright as a matter of course, unless it were expressly reserved in writing at the time of the sale. Another object of the Bill was this: It was found that considerable traffic was carried on in spurious pictures, which were palmed off upon the public under the names of artists of eminence, whose reputation suffered at the same time that the public were imposed upon. It was proposed to make that a positive misdemeanour, and to prohibit it under penalties. There were some questionable penal clauses in the former Bill which would not be found in the present, but in other respects it would be the same. He would only add that it was of considerable importance, if the principle of the Bill were approved of, that it should pass without delay, for otherwise foreign artists, who would have a copyright in their works in their

PATENT STEAM REGENERATOR.

own countries, would, in the forthcoming Exhibition, be placed in this position, that they should either withhold their works or be exposed to the danger of having their copyright invaded; and, therefore, it seemed to him a good opportunity for introducing a supplement to the existing Act. As to plastic art the learned gentleman said, casts and models were already protected in this country for a period of 28 years from the time of their first production, and, by virtue of the treaties relating to international copyright, foreign artists would have their works of sculpture protected by that Act of Parliament.

Leave was then given to bring in the Bill, which was subsequently read a first time.

STATUE TO JOSEPH LOCKE.

In reply to a question put by Sir J. SHELLEY whether any application had been made for permission to erect a statue of the late Joseph Locke in the gardens near St. Margaret's Church, Westminster, in which the statue of George Canning was placed; and, if so, whether he had granted or refused his consent thereto, Mr. COWPEN said that some of the friends of the late Joseph Locke desired to erect a statue to his memory, and offered to place it on a vacant space near the end of Great George-street, provided such a site could be appropriated for that purpose. It was his duty to state to those gentlemen that he was unable to offer them the site to which they alluded.

PATENT STEAM REGENERATOR.*

IN the drawing annexed, *a* is the cylinder of a horizontal high pressure-engine; *b*, a pipe for conveying the steam, which ordinarily escapes, after acting on the piston, through the pipe *c* into the receiver or surface condenser, *d*; that portion of the pipe (*c*) contained within the chamber or vessel (*d*) is perforated with numerous apertures or openings to admit of the steam separating and passing there through, coming in contact with the tubes or spaces contained therein, whereby it is condensed (forming almost a perfect vacuum, and increasing the effective force of the steam on the piston), and falls into the lower part of the receiver. This vessel or receiver is kept at a low temperature by means of cold water fed from the pipe *e* passing there through, and circulating up the tubes into the upper receptacle, where it flows into the exterior casing, from thence through the exit pipe *e'*.

By means of the pump *g*, the condensed steam is alternately drawn and forced from the vessel *d* through the pipes *f*, *h*, and *i*, into the regenerator *k*, placed in the flue, where it is subjected to the heat arising from the products of combustion, and thence by a second pipe *l* into the boiler *m*, which it reaches completely regenerated, and ready to act again on the piston with all its original force; a cock, *n*, is provided for the purpose of shutting the feed off from the lower portion of the boiler when necessary, and may be used as a sluice cock.

THE SITE OF THE HOLY SEPULCHRE.

MR. JAMES FERGUSON lately delivered a lecture at the Royal Institution "On the Site of the Holy Sepulchre at Jerusalem," his object being to prove that the Church of the Holy Sepulchre is not erected on the proper site, and that the Mosque of Omar is built over the spot where our Saviour was buried. He arrived at that conclusion by inductive reasoning from a great variety of facts. In the first place, he contended that the building called the "Mosque of Omar" could not have been intended for a mosque, which term signifies any erection pointing towards Mecca. Even a wall placed in that direction is a mosque, the enclosure and roof and decorations being merely accessories; but the Mosque of Omar, as originally constructed, did not possess the essential requisites of a mosque, and what was intended for the principal entrance is on the south side, so that a person entering would have had to turn his back on Mecca, which would be considered an outrage in a Mahometan place of worship.

Mr. Fergusson then considered the architectural features of the "Mosque of Omar," and pointed out characteristics which he considered indicated that it was

built in the time of Constantine, or between the years 300 and 400 of the Christian era. It was evidently a sepulchral edifice, and the elevated dome is erected over a remarkable rock, in the centre of the building, which rises above the level of the floor, and contains a small cave, and that, he had no doubt, was the real Holy Sepulchre. He had come to that conclusion when at Jerusalem about sixteen years ago; he had seen drawings of various parts of the interior taken by two English artists, who had obtained a special firman to enable them to do so; and that opinion was confirmed by the evidence he had since obtained, which proved that the building was of the age of Constantine, that it was intended for a sepulchral building, and that it occupies the position assigned by ancient writers to Golgotha. Mr. Fergusson referred to the works of Eusebius, Josephus, and of Clarke, in confirmation of his views, and he contended that the building known as the Church of the Holy Sepulchre exhibits none of the characteristics that should distinguish the real site. The rock inside is a mass of granite, which must have been carried there from some distance, for the rock on which Jerusalem is built is limestone. Neither does the antiquity of the recognised site add much to strengthen its authenticity, for it could not have been fixed upon earlier than the time of the Crusaders. Mr. Fergusson then proceeded to combat the objections that had been raised to the opinion that the Mosque of Omar is the real site of the Holy Sepulchre, the principle of which was that it is built within the present walls of Jerusalem. In answer to that objection he referred to Josephus and to other authorities to show that the ancient walls of the city did not include the site of the Mosque of Omar, an additional wall having been built which encloses within the boundaries of the city several of the holy places that formerly were outside the walls of Jerusalem.

The lecture was illustrated by drawings and photographs, representing the Golden Gate, the interior and exterior of the Mosque of Omar, and of the Church of the Holy Sepulchre, and elevations, showing the distinguishing styles of architecture which marked the dates of their erection.

THE ALBERT MEMORIAL.

ON Saturday the Committee recently nominated by the Queen to advise her Majesty in the choice and execution of a design for the proposed national memorial of the late Prince Consort held a preliminary meeting at the town residence of the Earl of Derby.

Her Majesty having, by the letter of General Grey, addressed to the Lord Mayor, intimated that "nothing would be more appropriate, provided it is on a scale of sufficient grandeur, than an obelisk to be erected in Hyde-park, on the site of the Great Exhibition of 1851, or on some immediately contiguous spot," the Committee at their meeting on Saturday addressed themselves to the consideration of how the wish of the Queen could be best carried to a practical and satisfactory result. Deferring for the moment, as a matter for ulterior consideration, the various questions relating to the artistic groups with which it is in contemplation to surround the monument, and on which it is proposed eventually to employ the most eminent artists of the day, the Committee confined their attention to the possibility of procuring a monolith, or single stone of granite, of the most imposing height and dimensions in other respects for the intended obelisk. They were informed that among the most noted granite quarries in the kingdom are those of Aberdeen and Peterhead; Cheesewring, in Cornwall; Haytor, in Devonshire; and that of the Duke of Argyll in the Island of Mull; those of Peterhead and Mull yielding red granite, and the rest grey. The opinion of the Committee appeared to be in favour of red granite rather than grey, the indestructibility of the material being equal. The prime object, however, being to obtain the grandest single block of stone which the country is capable of producing, having regard to the fund which may be ultimately placed at the disposal of the Committee by the liberality of the nation, the preference for red granite would probably be waived if it were shown that any of the grey quarries could yield a larger monolith than the red ones. The subject underwent much consideration, and eventually it was decided that measures should be taken forthwith to obtain, from those best able, from their knowledge and experience, to afford it, information as to the quarter from which a block of granite may be quarried calculated to answer the condition on which Her Majesty appears to have decided in favour of an obelisk—namely, that it be on a scale of sufficient grandeur. The total amount received in aid of the fund is now over £38,000.

* See page 114, ante.

CAPITALS FROM THE OXFORD MUSEUM.

PROFESSOR SMIRKE'S LECTURES ON ARCHITECTURE AT THE ROYAL ACADEMY.—LECTURE V.*

IN planning an apartment, as in planning a house, we must consult the genius of the place. There are occasions when a simple, geometrical plan would be most suitable; and there are also occasions when too great symmetry is to be avoided. In rooms intended for social uses, convenience, as well as beauty, alike suggest variety in boundary lines of the room. The deeply embowed recesses that occur so often in our old domestic architecture are a source of great beauty and interest, varying the lights and shadows, and breaking the monotony of parallel lines. The oriel window of our old halls, whatever may have been its purpose, is always a pleasing feature, and the deep bays in the galleries of those picturesque buildings happily compensate for their usual narrowness. "These are pretty places for conferences," says Lord Bacon, and his remark, in a lively and agreeable way, truly indicates the commodiousness of those cheerful recesses. The Italian masters, struck by the dryness of a plain rectangular form of room, adopted not infrequently a very happy mode of concealing or obviating that effect, by converting the upper part of the square room into an octagon supporting the angle walls by arches or pendentives, and so leaving the rectangular area unencroached upon. This contrivance is, in truth, of early date. At the Castel del Novo, in Naples, is, or was, a very fine hall wherein this expedient is most effectively carried out.

This mode of growing an octagon out of a square led to a variety of contrivances for the due decoration of the conch, or spandrel space, formed by the overhanging of the four diagonal walls, among which, perhaps, the most ingenious and elaborate were the pendentives devised by the Saracenic artists; a multitude of miniature groined arches, rising in successive tiers, and corbelling over so as to form those singular stalactitic ceilings so characteristic of Moorish architecture.

The remains at Pompeii, and, indeed, of Roman art over all Europe, show that the semi-cylindrical vault was the most usual mode of constructing ceilings in the Classic era; varied, often, however, by groining.

This diagonal vaulting was very dexterously executed by forming the intersecting lines of the groin in a careful, solid manner, filling in the spandrel spaces less carefully and with lighter materials, such as tufa and volcanic scoria. It was this mode of construction, no doubt, which led to the Mediæval mode of vaulting, the intersecting diagonal lines being more emphatically pronounced by wrought and moulded ribs. As at the Coliseum, Pantheon, and other Classic vaulting, we find the spandrel spaces executed on this principle, so in Mediæval buildings, chalk and even calcareous tufa (as at Glastonbury Abbey) were similarly used.

It is not, however, to be forgotten that flat timber ceilings were occasionally executed, not only during the whole Mediæval period, but even from earliest Classic times, also, builders so wrought. The Homeric writings abound with allusions to timber ceilings, with beams painted in bright colours, and even encased in plates of metal work; but we can now only trace indications of the existence of these timbers in the apertures left in the masonry for their reception.

In later Classic times representations of flat timber ceilings occur not infrequently in frescoes. In the 15th century (by far the most actively inventive period of modern art) Italian architects contrived an entirely novel form of ceiling, for which no preceding school of art had furnished the slightest precedent. They reconciled the convenience of a flat ceiling to the more elegant form of the vault, by adopting the cove, or half-vault. This was first executed in wood, the earliest examples of which, so far as I know, are at the Palace of the Academy, at Venice.

Afterwards, these coves became worked in plaster—a mode of construction which hardly bears date earlier than the beginning of the sixteenth century. Attempts are made to obtain a similar effect, in a more truthful mode of construction, by turning in masonry extremely flat elliptical vaults. But Sansovino, who ventured on this expedient at the Libreria, in Venice, was thrown into prison, and fined 1,000 scudi for its failure—a fate which must have powerfully operated on the minds of his brother artists in overcoming their scruples about plaster coves.

Another mode of forming ceilings which was much practised by early Italian artists was to frame them in deep coffers or panels, wholly of wood, often richly carved, painted, and gilt.

I know few palatial apartments equal in grandeur of effect to the great halls of the palace built by G. Romano, at Mantua. They are for the most part of this trabecated construction, and the gigantic force of their coffers, relieved by the extreme richness of the carving, proclaims the master hand of the great master who designed them. In the nearly contemporary flat, panelled ceilings, executed in England by Holbein, as in the Chapel Royal, St. James's, we have but weak and faint imitations; yet, even these are almost bold when compared with the tame and poor panelling of later times. The stuccatori of the last century introduced with some success a more free and artistic treatment of their material, but their art ultimately succumbed and gave way to plaster casting of the feeblest kind.

Having briefly touched on the subject of the forms and proportions of rooms, we will now pass on to the equally important subject of giving light to them.

So much of the architectural effect of a building for whatever purpose it may be destined, and so much of its aptness and convenience, depends on the mode that may be adopted of giving light to it, that it is certainly a matter demanding your special attention and study. The more so, because no general rules can be laid down for the proportioning of windows to the area they have to light.

Much, obviously, must always depend on the purpose of the room to be lighted; much also on the nature of the medium through which the light passes; much on the position of the windows; and, above all, perhaps, upon the degree of intensity of the light obtainable from without. The practice of Italy, for example, would be a very unsafe guide for us in our uncertain climate and sombre atmosphere. Here the most ample panes and the clearest glass will often hardly suffice, whilst, in Italy, such is the penetrating fervour of the sun's rays, that sometimes men are content, as at S. Miniato, near Florence, with the light that can make its way through slabs of alabaster in lieu of glass. We know, indeed, that laple specularis was much used for this purpose in Classic times. Then, again, the light which is obtainable in an open country and in a crowded city obviously must require totally different proportions, whilst a window filled with stained glass will need, in order to afford a given volume of light, an extent of perforated surface that would be altogether disproportionate where clear glass is used.

In the absence, then, of any definite rule, it becomes especially necessary, by habitual observation and comparison, to learn our wants and our resources.

I last week adverted to the importance of the study of the effects of light and shadow in the design of exterior architecture; at least equal importance is to be attached to this consideration in interior design.

In the production of all great effects, chiaroscuro plays an important part, whether it be in a building or a picture. The quality of grandeur depends not merely on largeness of dimensions, but on general treatment, and especially on the treatment of this chiaroscuro. When the form of an apartment is simple—rectangular for example—the impression of grandeur can perhaps only be effectually produced by real size; but when the form is complex, a new element of grandeur arises in the diversity and breadth of its light and dark parts. It is to this, far more than to any other cause, that we are to attribute the powerful impression made on the mind by the interior of a Gothic cathedral; the burst of light from the transept breaking the monotonous effect of the nave; the light on the screen brought out into prominence as seen in contrast with the dim haze of the choir beyond; the splendour of the clerestory, as opposed to the comparative gloom below; these are all effects wholly due to chiaroscuro, and constitute the chief charm of those fine architectural compositions. It has always appeared to me a subject of regret that the undue interference of incompetent judges prevented Sir Christopher Wren from carrying out his first and perfectly original idea for St. Paul's Cathedral, where the effects produced by the double vaulted aisle, surrounding the octagonal nave, would have been truly surprising; my conviction is that had that design been carried out an interior architectural scene would have been the result, wholly unparalleled in any building in Christendom.

The present is, of course, not a proper occasion for discussing the utilitarian requirements of a room. No doubt an apartment destined for pictures must have its light admitted far differently from a room where sculpture is to be exhibited, and both widely differ from

the requirements of an ordinary living-room. But these are questions, although of high importance to every student, which must not here engage us.

There are, however, purely æsthetic considerations connected with this subject of the admission of light, which are, to me, perfectly fit to be entertained within these walls. Very forcible effects are produced by mere contrast in the degree of light admitted.

When an apartment is desired to be specially marked by a gay and festive character, the eye should be prepared by subjecting it to a comparatively dim light. If, on the other hand, a solemn effect is to be aimed at, that object is promoted by previously subjecting the eye to a strong light. I have been frequently struck by the far greater effect of solemnity produced on the mind by entering a cathedral direct from the clear, external air, than when entered from the cloisters or chapter-house, where the eye has already got somewhat accustomed to a subdued light.

Indeed, for every great architectural scene it is well that the eye should be duly prepared. I think it may be broadly stated that a high light is, for almost every purpose, more pleasing than a low light. This is more especially the case when a grand or broad effect is aimed at. By lifting the windows above the ordinary range of vision, the intensity of the light is subdued, and a quiet effect is produced. The sombre light so striking in the early basilicas of Italy is due to this arrangement. No doubt much of the charm of those remarkable buildings is attributable to the unaffected simplicity of form which distinguishes them from the theatrical straining at effect, the multiplicity and complexity of parts, the architectural duster, which are apt to characterise later Mediæval works. Still this pleasing sobriety of form is greatly enhanced by the mode of admitting the light. I will refer you to another illustration, and that of a comparatively modern date, to show you that the principle which I urge on your attention is irrespective of style. At Milan, the ante-chapel of a church, probably of the sixteenth century, is appropriated as a mausoleum for the family of the great Condottiere Trivulzi. At a considerable height from the pavement are deep recesses, which receive the sarcophagi, and over all is the clerestory. The only light, therefore, that this lofty ante-chapel receives is from above, and the effect is extremely impressive. A brief inscription on the walls, alluding to the active life of the great commander, is in excellent keeping with the repose of the scene—

"Qui nunquam quiescit, quiescit—tace!"

(Be silent! for he who never rested, rests.)

I have now sufficiently brought before you the importance of the study of proportion and position of the lights; but yet another essentially necessary consideration remains; I mean the colour and texture of the walls to be lighted. Whether these vertical surfaces are themselves light or dark in tone; whether of a nature to absorb or to reflect light, are circumstances never to be overlooked.

We all know practically, when a room has to be lighted up artificially, how much the requisite number of lights depends on these accidental circumstances.

Observe the strong light produced by a single taper in a room with white walls and compare it with the dim glimmer obtained from the same taper in a room papered with a dark red paper.

Of course the same must hold good in the case of daylight. If, therefore, we have dark walls and furniture it behoves us to have large windows.

You perceive, then, how futile and empirical would be any rule for determining the proportion of solid to void in the external wall of a room. It is, in truth, experience derived from habitual, unremitted observation that can alone safely guide us.

"There are rooms," says the great observer, Bacon, "where you cannot tell where to become to be out of the sun or cold;" and the excess he condemns is, doubtless, a serious fault; but I believe, generally, that an excess of light is a less serious fault than a deficiency, for, in the one case a variety of means present themselves of remedying the defect, whilst the other is not so readily curable.

I have now touched upon some of the more material subjects of inquiry in the interior disposition of a building.

The subject is too large to admit of being treated on in detail in this place, and it would lead us out of the sphere of æsthetics to which I am limited. Nor shall I now enter upon the wide field of interior decoration. I will confine myself to the laying before you a few remarks on the general treatment of interior architecture.

I am afraid I venture an opinion at variance with general practice when I express my conviction that the introduction of a complete order into the interior of a building is a solecism and an indefensible inconsistency.

An entablature, as usually composed, seems essentially a piece of external architecture. The triglyphs of a Doric frieze, for example, are but the ends of the timbers of a floor or roof, and a cornice is but the overhanging extremities of a roof. To introduce these features, therefore, within, seems almost irrational. I know of no evidence of this practice having prevailed among the masters of Greek art, until that art had lost its youthful purity and the original intention of the several component parts of an order had been lost sight of. At all events, I think that these features of exterior construction should be avoided within ordinary apartments. I am aware that this dogma, carried out to its full limit, would extend to the condemnation of labels, or dripstones, and battlements and other details exclusively derived from external architecture. Nor do I see that such can be defended when introduced in the interior, except on the ground that these solecisms prevailed at the best periods of art, and are productive of great richness of effect.

At all events, I would counsel you to be on your guard against a too ready acquiescence in the ordinary practice of applying to the interior of buildings the forms and features of exterior architecture.

Nor need the exclusion of these rigid forms in any way embarrass us. Before "paint and paper" had usurped their undivided dominion over the decorators of our apartments, our ancestors resorted to many means of internal mural ornamentation—means, possibly, more costly, but certainly more worthy of the dignity of art.

Tyre supplied its rich drapery to embellish the walls of Roman buildings, and following in the steps of Egypt, Assyria and Greece, the artists of Rome loved to depict their fairest forms and most brilliant conceptions on the walls of their rooms. Inspired by the example of Eastern art, the founders of ecclesiastical architecture encrusted their walls with mosaics. The looms of the East, also, furnished them with rich hangings, rivalled afterwards by the weavers of France, of Flanders, and of England. But the too general demand for economical decoration in latter times has created whole branches of mechanical manufacture to supply the place and mock the semblance of more durable, solid, and real enrichment: costly hangings are represented by fabrics manufactured by the mill, and the most precious woods and marbles are reproduced by the simple apparatus of the paintbrush and the varnish pot.

It is now necessary that I should draw these desultory observations to a close; and in thus concluding my addresses to you, at all events for this year, I cannot do so more satisfactorily than by giving you a few words of hope and encouragement. I have, in the course of the season, brought to your notice many noble works and many distinguished men; let these examples excite your emulation and quicken your zeal; and especially do I hope that my faulting though earnest words may animate those among you, students of the Royal Academy, whose fortune it may be to encounter early difficulties. Let those difficulties be regarded as a call upon your patient exertions, and let them be the earnest of your ultimate success.

It was remarked to me by an eminent writer and acute observer of nature, in Canada, that those trees ever produced the best timber which, lying on the unsheltered outskirts of a forest, were consequently most exposed to the vicissitudes of climate and most agitated by storms and tempests. So it is, perhaps, that by similar trials the young mind is hardened and nurtured into a firm and vigorous maturity. I might detain you long by a view of the early struggles of great minds, from Giotto, who first imbibed the principles of that art by which he achieved an immortal name, whilst he "tended the homely, alighted, shepherd's trade," down to our own Turner, whose earliest aspirations of genius were breathed amidst the uncongenial obstacles and objects of his humble origin.

The annals of genius are, indeed, full of such examples. Nor let these experiences be lost, even on the youth who may be conscious of less elevated natural powers. We well know that all cannot be first in the race. Yet the history of art records many an instance of men of very moderate claims to the character of genius, whose useful labors have placed them in a highly honourable position. To such men, a steady, well-directed, and judicious application of their natural talents, united with an open, frank, and honourable conduct, have secured for them that reward to which higher genius has often failed to attain.

ON THE PLAN AND CONSTRUCTION OF THE WESTMINSTER PALACE HOTEL.*

It having been intimated that a brief account of the Westminster Palace Hotel might possibly afford some matter of interest to the members of this Institute, my brother, Mr. William Mosley, with pleasure has drawn up the following particulars.

The demand for improved hotel accommodation in the metropolis having been met by a disposition on the part of the public to vest capital in such undertakings, several structures of this kind have arisen, and the movement bids fair to make such buildings, with regard to extent and importance, second to none of those in the other capitals of the old or new world.

The Westminster Palace Hotel Company secured in 1837 the plot of ground forming the angle between the east end of Victoria-street and Tothill-street, containing an available building surface of 3,500 square yards, for a term of 88 years, and at an annual rent of £23, or 6s. 4d. per square yard, or about £3 per foot frontage in Victoria-street.

An Act of Parliament was deemed requisite to afford the Westminster Improvement Commissioners such powers as would enable them to grant a valid title, but the delay occasioned in obtaining that Act prevented the commencement of the excavation for the building until June, 1858.

The architects had, however, progressed with the plans, and by obtaining a separate tender for the excavation, that work was proceeding while the drawings were being completed, and the acceptance of the tender for the work ultimately took place in the following October.

The original contents of the surface of the site was as before stated—3,500 square yards, this was increased during the progress of the structure, and additional land has since been obtained. The total area covered which extends on the basement, is 3,336 square yards, and on the ground floor 2,795 square yards.

The excavation for the foundation exposed the maiden surface of the soil, reached at a depth of 12 feet below the level of the present road, consisting of an even bed of peat earth about 3 feet in thickness, overlying a thin stratum of clay, which latter rested upon a stratum of fine sand full of water.

As might be expected, the original surface (the bog earth) was not without some traces of natural productions or of the early occupants of the locality. Roots of great willow trees, the bed of a rivulet, with plankled margin, a hard caneway in a direction parallel with Tothill-street, leading to the western gateway of the "Close of Westminster Abbey," a pilgrim's hat of goat's hair, pieces of leather garments, with some few other relics of the pilgrims passing to the Holy Shrine from the Tabernacle in Tothill-street, indicated the ancient uses of this part of Thorney Island. But the most interesting circumstance connected with the site is the fact that the house of John Caxton stood near the west end of the present Tothill-street front of the building, and where it is intended at some future time to place a statue to his memory.

Thus the enduring memorials of bygone time are made to give way before the progress of modern improvements, which by many will be thought by no means an amiable feature in the pursuits of modern architects.

Over the whole surface of the sand, when the peat had been removed, a slab of concrete, four feet in thickness, was thrown, and the building was thus permanently secured from all risk of subsidence from any defects in the nature of the subsoil.

The rise of the tidal waters up the Victoria-street sewer became a matter of grave consideration. Equally so did the desirableness of giving the least amount of elevation to the ground floor above the line of the adjoining streets employ the attention of the architects. They ultimately fixed the ground floor level at seven feet above the paving at the entrance as the height which would secure the dryness of the basement floor and afford a sufficient elevation for the great kitchen (16 feet high), and this level gave an opportunity for obtaining mezzanine-rooms over the other parts of the basement where the smaller divisions occurred, and which was taken "advantage of" for securing the necessary auxiliary rooms and offices immediately adjoining and above those in which the greater culinary operations were to be carried on.

The necessary height of 17 feet 6 inches given to the other large apartments, such as the coffee-room, great banquetting-room, and eastern-room, being an unnecessary elevation for the smaller rooms on the western side of the entrance, it was determined at once to "dare criticism," and to design the ground floor façade of the edifice with different ranges of string-courses and window openings on either side the principal entrance; and they have had no reason to complain of the criticism which has arisen, for it has proved that the "general eye" is more forgiving for wants of uniformity in parts, when necessity and fitness concur in demanding such a deviation from the established rule, than they could have given it credit for.

By the arrangement above named they were enabled to obtain three floors of rooms on the west side of the centre, when they had but two floors on the eastern side; the middle floor, on a level with Victoria-street (also reached by descending a few steps from the centre hall), and the upper floor raised 6 feet above the level of the hall, and reached by ascending three steps from the half space of the principal staircase, from which extends a central corridor to the west end of the building.

The whole of the western half of the building is let to the India Board at a rental of £5,000 per annum, and the arrangement of this portion in the way it was planned, although accidental, has been such as to enable the Hotel Company to acquire the most valuable connection and rental, and which leaves a complete hotel in the other part of the structure. Four rooms in depth, from front to rear, are obtained by planning three small internal courts (30 feet in length and 20 feet in width), and thus the accommodation of this wing of the building is swelled to upwards of 160 sitting and bed rooms.

The space of 4 feet 6 inches, which has been left between the top of the concrete and the level of the basement-paving (for raising it out of the way of the tidal-water), is made available for affording the means of cleaning out the drains, smoke flues from all the cooking stoves, water and gas pipes; and to make the system of drainage more available, iron moveable covers are put on all the drain pipes (which it should be stated are of cast-iron), and a gangway is left through all the sleeper walls; thus, by the removal of the Yorkshire stone "ways" (provided in the floor) a man may pass all over the foundation without any further interruption of the surface.

This space is also used as a reservoir for cool air, for the supply of the kitchen, to which it is admitted by large gratings under the cooks' tables.

As may be supposed, the surface under the floor exhibits a perfect network of pipes, flues, and drains.

Independently of waterclosets and bath-rooms, larders, &c., &c., there are 286 rooms to let in the hotel 70 water-closets and 14 bath-rooms, the larders, and store-rooms of various kinds occupy the vanities under Victoria-street, and are rendered immediately available by the area between them and the kitchen and offices being covered with glass.

The original contract for the building was £68,966, but the cubical contents was extended by the increased surface subsequently obtained. The fitting up a portion for the India Board, the fittings of all kinds, and other circumstances, over which the architects had no control, produced eventually an increased expenditure, making the total cost about £97,000.

Of the general features of the façade it is unnecessary to speak; whatever defects it may have, are now far over determined; and whether the opinion be favourable or unfavourable will very much result from the previous predilections and particular tastes of the critics. The architects, however, claim for themselves the credit of having shown some desire to construct such a building as, while it was suited to the peculiarities of the site, would possess at least some indication of "high art," untrammelled by conventionalities, and they may, perhaps, refer to the mansard roofing as proof, at least, of the latter statement.

It has not been without some anxiety that they have waited the "growing up" of the business of the hotel, to be informed, from actual experience, if the outlay which has arisen from its strictly artistic and ornamental features, beyond what was actually necessary for providing the simple required amount of accommodation, would or would not be sanctioned by the actual "money return" arising from the particular action of this part of the construction; the result has relieved them from any such anxiety, and they believe that the amount of such work has had its special revenue-producing effect.

The convenient arrangement of the parts of the hotel received careful study, and the more obvious necessities of adapting the larger and smaller divisions of the building to their respective purposes—planning the greater part of the bed and sitting rooms communicating directly with one another with double doors, and at the same time having separate entrances from the passages; arranging for the rooms to be let apart for committees, arbitrations and other business purposes, with external approach; providing sufficient waiters' rooms on the several floors; baths and waterclosets; and withal, taking care that these were sufficient, but not "in excess" of size, or that there was not any unnecessary room lost in the passages, and that all the stories which it was possible to obtain, but at the same time that sufficient height was given to each, and that thus the greatest revenue would be produced. They had then to plan the great coffee-room, banquetting-hall, ladies' coffee-room, &c., convenient in situation, and ready of access, and having at the same time taken care that the kitchens (and all their auxiliary apartments) were conveniently placed, so as to be easily overlooked by the manager. The plans exhibited to the meeting will show what these arrangements are—a matter not easily understood in the building itself, since it has been partially rearranged for the India Board.

Having had their attention turned to matters of ventilation in regard to public buildings during a long course of years, in their first consideration of the design for the present structure a general system of artificial ventilation received anxious consideration; but, looking at the matter in all its bearings, with reference to the daily changing circumstances of an hotel, they determined to limit all artificial means of removing heated or vitiated air to the coffee-room, great banquetting-room, some of the water-closets and the kitchen, and this they have been enabled to achieve by generating a great up-draught in the usual way with the furnace heat, and thus to make it self-acting, avoiding the "danger" of subsequent neglect or disarrangement too common in all such ventilating undertakings when solely for ventilating purposes.

This has been done as follows:—An "awkward" spandrel piece, formed by the irregularity in the shape of the "site," is cut off from the plan and formed into a great smoke and ventilating shaft; it has a horizontal area of 48 feet, and although a passage intervenes between this and the great kitchen range, all the smoke and heat are carried over the passage into a funnel 1 foot 3 inches in diameter, reaching from the basement to the top of the brick shaft above the roof of the hotel; and running up the centre of the before named brick shaft are carried two other funnels, into which are collected the heat and smoke from all the charcoal and coke stoves, ovens, hot plates, steam and hot-water boilers, and by this means so much heat is radiated from the iron surface of the funnels in the space round them in the brick shaft as to create a continual strong "up-draught," and into which, at various places, horizontal flues communicating with the various rooms and places before named have their termination, and so the continual "sucking up" of the heated and vitiated air is going on night and day, and "cool" air is admitted to the kitchen from the spaces before named under the floor, and to the other apartments by means of Moore's ventilators, or the opening of the doors or windows.

We may add, as a practical remark, with regard to this matter, that we believe that the peculiarities of an hotel make any other mode of artificial ventilation unsuitable; other architects may carry our present ideas out more fully and better, but we recommend them to avoid any peculiar general system of ventilation, although applicable to other public buildings.

The floors throughout the building (with the exception of two or three rooms in the basement mezzanine), are entirely of fireproof materials, (vide full sized section.)

The construction of the floors, it will be seen by reference to the section, is as follows: Wrought-iron rolled joists, 7 inches in depth, with flanges on each side for carrying the laths to support the concrete, with bearings varying up to 17 feet 6 inches in length, carried either by plate box girders or by cross walls, were placed two feet apart, and fir laths, 1½ inch square, were dropped on the flanges; upon these were laid five inches of concrete, composed of one part of ground blue has lime, five parts roughly screened Thames gravel and fir fillets 1 by 4 having been first fixed round the margins of each room for securing the carpets, a flooring was made by floating, firstly, a thickness of three-quarters of an inch of Portland cement and sand in equal parts; and, secondly, when the same was quite dry, finishing with three-quarters of an inch of pure Portland cement, and to the walls was added a skirting of Keen's cement.

Besides the fireproof character which this mode of construction gives the building, a freedom from the harbouring of insects was also anticipated, as well as the absence of noise, and we believe that in all these respects it has been found to act admirably.

The inconvenient transmission of sound from floor to floor (the great evil found to exist when brick arches, or concrete alone, however thick are used), determined them to provide an entirely (and in every sense of the word) independent ceiling throughout every floor of the building, and although this (being formed in the usual way, by binders and ceiling joists, lathed and plastered) was in itself an inflammable construction, yet with the cement floor and skirting over it, and cased as a ceiling is, by lime and hair plasterings, out of the reach of any accidental common cause of fire, it is not thought by the architects to take much from the fireproof quality of the structure.

The great fireproof quality (next to the floor) arises from what would be quarter partitions in other buildings. Throughout this building (with very small exception) the partitions are composed of Beart's perforated bricks set in Roman cement; and such was the strength of the iron joists and plate girders on each floor, that they commenced carrying up these walls in the upper floors first, and so to the one pair, even over the large voids of the great dining-room and coffee-rooms, as by this means was avoided any evil from the deflection of the wrought-iron work when loaded.

These half brick walls, when rendered with lime and hair on each side, are better non-conductors of sound from room to room than the architects had expected, and are in all respects a most successful mode of treating thin internal partition walls.

The other great fireproof principle is that of carrying up all the main cross walls through the roofs, and treating them in every respect as party walls, except with regard to necessary doorways and dressings, and these being away from any other inflammable materials (the floors and skirtings being of cement), no great danger of the spread of fire can arise.

The strength of the floors has had a very unexpected and severe test, in consequence of the occupation by the India Board; for they found upon a previous calculation that they required to place a no less weight than 227 tons of books in the upper floor, and which, when distributed, gave no less than 12 tons upon the floor of each room, with joists having upwards of 16 feet bearing; this the architects were able to assent to, for, upon calculation, they found them capable of carrying for a continuance 16 tons.

It was part of their original design that an ascending carriage should be supplied the hotel, for reaching the upper floors; that it should be capable of carrying up persons day and night, at any moment; that this should be done with the greatest dispatch, free from danger, and that, as much as possible, noises in the working should be avoided; also that it should not occupy much room, or by means of furnaces or flues, occasion any unnecessary heat in the building. Taking all these circumstances into account, they determined upon one of Sir William Armstrong's hydraulic machines as the contrivance most suitable for the purpose.

The Chelsea Waterworks giving a water supply of sufficient elevation for working the ram, they obtained an estimate from Messrs. Carricks, who had executed the various smaller lifts for the hotel; but having under the general contract only provided the shaft, the reservoir to contain 6,000 gallons of water on the top of the building, and another above the basement floor, so that the water after use would not run to waste, but be re-used in the culinary part of the establishment, this method of transit was determined upon, but the contract for completing the hoist still remains in abeyance.

The perfect safety of an apparatus of this kind became necessarily a matter of earnest consideration to the architects, as besides the constant superintendence of the conductor, who was to ride up and down with the passengers, and by pulling the rope (acting on the valve) would stop the cat at the floor intended to be reached, a further arrangement to avoid personal risk from the breaking of the chain was necessary, and Mr. Carrick (if permitted) will explain the arrangement of his safety check to prevent any danger arising therefrom.

The means of communicating readily, and, to a certain extent, noiselessly with the various waiters, was considered of great importance, and, thanks to the inventive faculties of this inventive period, the architects found various new modes of doing this; but in the

* Read before the Institute of Larch Architects, on the 3rd instant, by ANDREW MOSELEY, Fellow.

pneumatic system of belhanging, one at once adaptable to their purpose, as by an arrangement of that apparatus to tablets containing the number of the rooms, they have been able to produce in the building a nearly noiseless, durable, and most effective system of communication. This is carried on by means of a piston, which, exhausting the air in a small tube, releases a catch holding up a tablet on which the number of the room is placed, and, at the same time (at the station of the tablets near the various waiters' stations) striking a small bell.

After a consideration of the electric bell apparatus, and the old wire crank and tablet system, they have reason, now the actual experience of its operation has been tested, to congratulate themselves on the success of the apparatus, and they have requested Mr. Thom, the patentee, to attend the meeting to illustrate what they have briefly said on this subject.

An extended application of speaking tubes has been made, which, besides being attached to the lifts, are carried from the manager's, housekeeper's, clerk's, cellarman's, clerk of the kitchen, hall porter, coffee room, &c., &c., and to all the various parts of the structure to and from which messages are likely to become necessary, and the ease, quiet, and dispatch which these afford "in the working" of the hotel cannot be over-estimated.

LONDON BRIDGE RAILWAYS TERMINUS HOTEL.*

IN accordance with a request from your active secretary, I have the pleasure to submit a few particulars with reference to the London-bridge Railway Terminus Hotel, now being erected under my direction.

I should not have ventured to offer any description of this building, except as a supplement to the paper of Mr. Mosely, as I am not aware of any novelty of arrangement or construction worthy of the attention of the Institute.

It appears that London, which has hitherto been badly supplied with hotel accommodation, is at last making a move in the right direction, and constructing buildings more consistent with the requirements of the numerous travellers who are constantly arriving at, and departing from, its great metropolitan terminus.

It has been said, with reference to the hotel in question, that the extension of the railway to Charing-cross and the City would lead London-bridge without customers, but I do not think that the shareholders need apprehend any depreciation of their property from this cause. The extension will bring from the South Western Railway and elsewhere as many as it takes away, and the Brighton Company, at the present moment, are giving notices for the extension of their London-bridge station. It appears to me that London-bridge must always continue one of the great railway termini of the world.

The building stands at the south-west corner of the Brighton station, with frontages to Joiner-street and St. Thomas's-street.

Level of the streets is about 25 feet below the railway level, and in designing the building it was necessary to keep the principal floor on the level of the platform or thereabouts.

The principal entrance on the lower level is from St. Thomas's-street, and with the exception of the entrance-hall, principal staircase, and manager's offices, the whole of the ground floor is appropriated to the domestic offices of the hotel; the basement being devoted almost entirely to cellars.

The following is a summary of the accommodation provided:—

Basement.—Wine, beer, coal, and ice cellars, and a large room for servants; dining-room, furnace for baths, and warming apparatus.

Ground Story.—Entrance-hall and staircase. Secondary staircase from Joiner-street, and club entrance, hereafter referred to. Manager's offices and bar. The remainder is appropriated to the offices consisting of kitchen, sculleries, larders, still-rooms, pantries, servants' hall, &c., &c.; the two portions which are bisected by the entrance-hall being connected together by a passage-way under principal staircase. The north-west angle is appropriated to the tap, being immediately at foot of the steps leading from the railway to Joiner-street, and will, no doubt, have plenty of customers from the porters employed on the railway.

One-pair Story.—The principal part of this floor is proposed to be devoted to the use of a Southwark club (which is much wanted by the professional and commercial classes in the Borough), and will yield a large rental to the Hotel Company. The club coffee-room will be supplied from the hotel kitchen, and will be another considerable source of profit. The rooms for the club consist of coffee-room, dining-room, morning-room, smoking-room, and billiard-room, with private rooms, &c., &c. The remainder of this floor is devoted to the living rooms of the tap, and to the linen department of the hotel.

Two-Pair Story.—Being the railway level comprises the principal coffee-room, 70 feet by 29 feet; ladies' coffee-room, 30 feet by 30 feet; and library and reading-room, 29 feet by 25 feet, with the usual serving rooms and pantries, and sundry private rooms. The principal staircase from the lower level terminates on this floor, and a staircase in both wings is continued upwards. An entresol floor is obtained in the wings, making up the height of the large rooms. The remainder of the stories are divided in the usual way with bath-rooms, waiting-rooms, &c. The total number of rooms of all sorts, exclusive of cellars, is 292. The frontage to St. Thomas's-street is 130 feet, and that to Joiner-street is 97 feet, and the total height from pavement of street to ridge of roof is 112 feet, and to summit of terminals over ventilating shafts, 150 feet.

The Company are possessed of additional land in St. Thomas's-street, on which it is proposed to erect a large public room, with additional bed-rooms over.

I shall not attempt to describe the style of the building. It forms a considerable feature in the architecture of Southwark, and, being freely treated, I leave it to the ingenuity of the Institute to find a name.

The building is constructed with white bricks and Portland stone, and the roof is covered with green slates.

I fear that this dry description of a building will not sufficiently interest the members of the Institute, and as no great difficulties have arisen in the construction, no great interest will be attached to the description thereof.

On excavating for the foundation, we found, at about 12 feet from the surface, a layer of soft running sand, about 4 feet thick, very full of water. The whole of this was taken out, and a solid bed of hard gravel reached. The water was kept within bounds by hand-pumps, and the trenches filled with concrete made with blue lias, which was carried up above the ordinary level of the water, which was somewhat affected by the tides. Nothing of any interest was found in the excavations, except a few pieces of broken pottery, sent herewith. The footings of main wall are 6 feet thick, reduced to 3 feet in thickness, and a layer of asphalt 1-inch thick laid over the whole surface and on the vertical faces of the basement walls. The walls are 4 bricks thick up to ground line; 3½ bricks thick up to two-pair level; 3 bricks thick up to four-pair level; 2½ bricks up to cornice.

It has not been attempted to make the building fireproof. The staircases are of stone throughout, and the corridors and passages are constructed with tile arches and wrought-iron girders, paved with 3-inch Portland. The basement is entirely covered with tile arches and wrought-iron springs, and the ceiling of kitchen is also formed with tile arches. The arches are all in three thicknesses, set in Roman cement.

The only point requiring special consideration in construction was in relation to the girders over the large rooms, which were of considerable span, and had of necessity to carry the division walls and chimney-breasts of six stories, with the floors, tile, arching and paving of corridors.

It appeared, therefore, to be very desirable to introduce girders at every floor, to reduce the weight on each girder as much as possible, and so that, in the event of any accident arising from fire or other causes, every floor should be independent and self-supporting. The wrought-iron girders are placed immediately under each of the 9-inch division walls, the flanges of which are afterwards built up and plastered over.

A parallel girder of smaller dimensions acts as a trimming girder; a 4-inch landing from top of main girder to trimming girder, perforated exactly for the flues, carries the projection of the chimney-breasts, and the hearths are afterwards formed on top of landings with tiles.

The whole of the girders were introduced and fitted together before the sub-division walls, chimney-breasts, &c., were built. This was found a convenient arrangement for handling and placing the long girders in position. The girders had a bearing at one end on main wall, and at the other on cast-iron stanchions, which were also built into the thickness of the 9-inch division walls. As these girders passed through the ventilating chambers, apertures were left in the web at the proper points. The greatest estimated weight on one of these girders was 53 tons in the centre, and it will, therefore, be clear that a considerable sectional area was necessary, the bearing being 28 feet. The heaviest girder weighed 14 tons.

The ventilation is provided for as follows:—The kitchen department, smoking-room, and rooms on one pair are connected with the shaft shown on plan, the centre of which is occupied by a galvanised iron tube conveying the smoke from all the furnaces and fires in kitchen department. The remainder of the building is ventilated by means of chambers formed between the floors and ceilings of corridor. These are connected with vertical shafts in each wing. A powerful hot-water coil is introduced in these shafts, heated from the furnace which supplies the baths and hot-water service, so that it will be continually in operation winter and summer. These shafts are continued up, and form the terminations of the pyramidal roofs of pavilions. The ventilating chambers are formed between the tile arches and the paving of corridors. A warming apparatus in the basement will suffice to keep the staircases at a moderate temperature. An ample supply of external air is admitted to every fireplace. Cistern room to the extent of 25,000 gallons is provided, distributed over the building, and, as the high service will not reach the upper stories, a steam pump is provided in scullery in connection with the general steam apparatus, which pumps the water from the low-service main.

Mr. Billing's patent iron throat valves and terra-cotta terminals have been fixed to the chimneys, for the prevention of smoke.

The excavations were commenced in December, 1860, but the old buildings on the site were not cleared away until January, 1861. The works have been progressing steadily, and notwithstanding the interference from the strike, the building has made rapid progress, thanks to the well-known energy and intelligence of the contractors, Messrs. Lucas, whose zeal and ability need no further remark from me. The total quantity of bricks used in the construction is three millions; the quantity of wrought iron, 200 tons; the quantity of cast iron, 80 tons; and 15,000 cubic feet of timber. The whole of the bricks and mortar have been raised by a hoist constructed in the well-hole of the eastern staircase and burrowed on each floor to the position required. This hoist was worked by a horse, who had the run of a back street, and the length of which just admitted of the materials reaching the room. The stone was raised by a small steam-engine, and the whole of the ironwork was lifted inside the building and placed in position without the slightest accident.

The whole has been carried on without a clerk of the works, under the immediate superintendence of my active and intelligent assistant, Mr. Harris.

I have great pleasure in bearing testimony to the skill and intelligence and ready attention of Messrs. Lucas's principal foreman, Mr. Steel, and to the energy and obliging and hearty assistance of the foremen of the several branches of work.

The work is being executed at a schedule of prices. The total cost will be £60,000, equal to about 1s. a cubic foot, including stoves, bath and bell work, gas warming, and ventilating arrangement, and everything complete except furniture. The kitchen fittings, bath, bell, and gas work, warming apparatus, &c., are being ably executed by Messrs. Jeakes and Co., and the carving has been effectively executed by Mr. Toltm. The building was commenced in January, 1861, and will be completed and ready for opening concurrently with the Great International Exhibition, in May, 1862, being a period of sixteen months.

I trust the Institute will not consider I have occupied their time unnecessarily with this uninteresting description. I only hope it may be useful as a means of comparing the details and arrangement of this with other kindred buildings.

THAMES EMBANKMENT COMMISSION.—SURREY SIDE.

ON Thursday, the 27th ult., the Commissioners re-assembled at the offices of the Commission in Victoria-street, Westminster; Captain Douglas Galton, of the Royal Engineers, in the chair; and took into consideration five plans for embanking the Surrey side of the Thames. The first plan submitted was by Mr. W. A. Brooks, C.E. He proposed four quays for the line of embankment. The first from Fore-street, Lambeth, to Westminster-bridge; the second between Westminster-bridge and Bankside, Southwark; the third off St. Saviour's Dock, Bermondsey; and the fourth from the Thames Tunnel to King and Queen Stairs, Rotherhithe. The estimated cost of the embankment from Lambeth Palace to Bankside will be £162,492. Mr. Anstin proposed a 30-feet embankment wall, with conduits into which the sewers would discharge, combined with docks between the embankment walls. Mr. T. E. Weller's plan consisted of a solid embankment from Westminster-bridge to Blackfriars, following the present line of the river frontage. Mr. J. Lightfoot's embankment would run from Vauxhall to Lambeth, with a roadway in front of all the premises to Rotherhithe, with docks between the roadway and the premises to London-bridge. Also, a new bridge opposite the Horse Guards, and a new street to unite York-street and College-street. Mr. Giles suggested an embankment from Vauxhall to Lambeth-bridge, and a roadway 60 feet wide to Bankside, and a new road from Nine-elms to Lambeth.

THE LATE FALL OF HOUSES AT HACKNEY.

AT the last meeting of the Metropolitan Board of Works Mr. G. Legg, district surveyor, made a report respecting the recent fall of two houses at Hackney. He stated that the two houses were respectively five stories in height, and erecting at the very base of the embankment of the North London Railway, a few yards from the Hackney station; that the erection was pressed on with expedition, and that the front of the west house and part of that of the east house fell into the buildings. The causes of the accident he considered were the proximity of the buildings to the railway, the vibration arising from the breaks acting upon the trains at the spot, the greenness of the work, the incompleteness of the work, and the large number of men stated to have been at work on the front that first gave way. Also, the buildings proceeding at this time of the year, and necessarily affected by the frost and rapid changes of the weather and temperature, together with the omission of due supervision by the foreman on behalf of the builder, and the collars to the roof not being in. It was given in evidence that six men were engaged running the cornice of the front and on the two-pair story, and three fixing a triple-light sash frame on the one-pair story; these operations proceeding at the same period, the front buckled, and this caused the accident. Remarks had been made on some of the materials, which were of the usual mixed character employed by speculating builders, and of the same description as the other eight houses erected by Mr. Amos in continuation; the party-wall was standing five stories high without the slightest support but the two houses, thereby showing that the remarks were unnecessary. The building was erected up to the one-pair story during the period Mr. Legg's predecessor held office, and stood for a short time prior to the builder proceeding with the works.

* Read before the Royal Institute of British Architects, by Mr. HENRY CURREY, on Monday, March 3rd.

† Plan and view will be found in Vol. VII., pp. 248, 249.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

An ordinary general meeting of this body was held on Monday evening at the rooms, 9, Conduit-street, Regent-street; Mr. M. DIGNY WYATT, V.P., in the chair.

Mr. T. HAYTER LEWIS, hon. secretary, read the minutes of proceedings at the last meeting, which were approved of and confirmed.

New Fellow.—Mr. George Aitchison, of Muscovy-court, Trinity-square, having been balloted for, was duly elected a Fellow of the Institute.

Donations.—Mr. J. BELL, hon. secretary, announced several donations, including a part of the "Dictionary of Architecture."

The CHAIRMAN called attention to the value of this work, the conductors of which invited the co-operation and assistance of the members of the profession in bringing it out.

Professor KERR could state from experience the Dictionary contained the most valuable information on the subject of architecture.

A vote of thanks was passed to the donors.

The Competition for the Façade of the Florence Cathedral, and the Prince Consort Obelisk.—The CHAIRMAN said that before proceeding to the immediate business of the evening there were two subjects to which he wished to direct the attention of the meeting. One was the fact that the Council of the Institute had been in correspondence with the Italian Minister in London, and the result was that a series of tracings sent from the Government of Italy, showing the modes of operation adopted at the Cathedral of Florence, would be exhibited at the rooms of the Institute, so that they might be examined by all who might wish to compete for the façade of the Cathedral more conveniently than at the rooms of the embassy. The second subject to which he wished to draw their attention was a very interesting one. He held in his hand a letter from one of the most respected members of the Committee appointed by her Majesty to make suggestions as to the best mode of carrying out the proposed erection of an obelisk to commemorate the late Prince Consort. The object of the letter was to invite the aid of the Council, and through the Council the Institute generally, in making suggestions as to the supply of the best kind of stones, with reference to quality and colour, whether of granite or other stone, and the cost of conveyance by land or sea from places where it was to be had to London. Now, it was just possible some of the members of the Institute might have practical experience on the subject, and if any gentleman possessed of information on the subject would communicate with the Council they would be glad to place such information at the disposal of the Committee appointed by her Majesty, and the labours of that Committee would, he was sure, be looked forward to with the greatest interest by all.

Mr. BOULNOIS wished to know if there was any objection to the letter being read.

The CHAIRMAN said it was a privileged letter to some extent, but he had laid the substance of it before the meeting.

Mr. BOULNOIS thought it would be well to appoint a committee to consider the subject of the letter, to make full investigation, and lay the result with the greatest possible authority before the Council.

The CHAIRMAN said the letter had been discussed in the Council, and it was thought the best plan would be to ask the members generally of the Institute to give information, which could then be collected and presented in a permanent manner.

Mr. BOULNOIS thought this was a matter upon which the Institute ought to speak out with force and authority.

The subject then dropped.

The Institute Prizes.—Mr. T. HAYTER LEWIS, hon. sec., said at the private meeting of the Institute, held on the previous Monday, the envelopes containing the names of the gentlemen to whom prizes had been awarded were, by mistake, not opened. That was partly his fault, but what had taken place was as well, perhaps, because some of the letters unopened referred to designs which were commended, but to which prizes were not awarded. Since Monday the gentlemen whose designs were commended had been asked for permission to publish their names, and, with one exception, such permission had been received. The exception he referred to was the author of the design signed "Humber," but if that gentleman was in the room, and wished his name to transpire, it would be well. (To this no response was given at the time.)

The CHAIRMAN then opened the sealed letters bearing mottoes corresponding to those on the prize designs, and announced the names of the successful candidates, which were as follow:—

1. The silver medal of the Institute, with five guineas, to Mr. Frederick R. Wilson, Associate, of Alnwick, for his drawings and description of Breckburn priory, Northumberland. 2. Neither of the designs for the Soane medallion having been considered of sufficient merit to entitle the author to the prize offered, the prize in books, of the value of five guineas, for the best design submitted, was found to have been awarded to Mr. Charles H. M. Mileham, of 18, John-street, Bedford-row. 3. The ex-President, Professor Cockerell's prize of ten guineas to Mr. A. W. Davis, of 15, Park-side, Knightsbridge, for his design for a market house; the Institute book prize to the second in merit to Mr. R. Phœnix Spiers, Associate, of 89, Upper Ebury-street, Piccadilly, for his design for a villa; the design for a chapel, by Mr. William Hallam, student, of Kirton-in-Lindsey, Lincolnshire, and that for a villa, by "Humber," were commended. 4. The prize of ten guineas offered by Mr. Tite, M.P., F.R.S., President of the Institute, to Mr. Henry S. Legg, Associate, of 6, South-square, Gray's-inn, for his designs for a railway station and a town-hall. 5. The students' prize in books to Mr. R. H. Carpenter, student, for his design for a dispensary for a manufacturing town. The designs for the same subject, by Mr. Samuel Fry and Mr. J. T. Perry, students, were commended. The prize in books for the best series of monthly sketches to Mr. Samuel Fry, student; the series by Mr. George Baxter, Jun., were commended.

The Westminster Palace Hotel.—Mr. ANDREW MOSELEY (Fellow) then read a paper entitled "Some Particulars regarding the Plan and Construction of the Westminster Palace Hotel." The paper is given elsewhere.

The London-bridge Railway Terminus Hotel.—Mr. JAMES BELL, hon. sec., then read a paper by Mr. Henry Currey (Fellow), entitled "Some Account of the London-bridge Railway Terminus Hotel;" which will be found in another page.

The CHAIRMAN having invited discussion, called upon Mr. Carrick to give some account of his hydraulic hoist, which was referred to in Mr. Moseley's paper.

Mr. JAMES CARRICK (engineer) said, the principle or motive power of the

hoist was an application of a patent of Sir William Armstrong—viz., the placing of a hydraulic ram between sheave blocks. The car, being attached to one end of a chain reeved over these blocks, travels through a space equal to the stroke of the ram multiplied by the number of pulleys over which the chain is passed. Supply and exit water tanks for working the ram are provided and placed, the one at the top of the building and the other at a lower level, in which the discharged water is utilised for the kitchen service. The available head of water is at present 75 feet, which may, however, be easily increased; the supply pipe is 5 inches diameter, and the diameter of the ram 26 inches. The tanks are of the cubic capacity of 4,000 gallons, and are filled three times per day from the water company's main, providing a supply for 120 ascents per day. The lift is designed to carry two persons and their luggage and the attendant, and is started and stopped at the respective floors by the attendant pulling a small chain, which opens and shuts the valve of the apparatus. A hundred gallons of water are required for each ascent of the car; but no water is required for its descent, the ram being so arranged as to descend by the counterbalance of the car's weight. A safety apparatus is provided and attached to the car, which consists of two teetled or ratchet-faced eccentrics placed on the end of the shaft or cross bar by which the car is suspended. The eccentrics are kept out of action by two powerful volute springs, but in the event of the main chain breaking they are immediately freed, and their force directed against the eccentrics which bite the guide bars, and so suspend the car.

In answer to a question, Mr. Carrick said the car would ascend in half a minute.

Mr. THORN explained a model on the table representing his system of bells (referred to in Mr. Moseley's paper.) In large mansions the bell wires were always getting out of order, and that led to his invention, by which all such disorder was prevented. He first tried his invention at the Westminster Palace Hotel, and it had been found highly successful. There were now seven miles of pipe laid by him in that hotel for 400 bells. The bells would cost from 25s. to 35s. each. He believed he was about to be engaged to supply the house of Lord Overstone with these bells.

Mr. F. H. FOWLER thought some of the arrangements at the Westminster Palace Hotel had acted well, and admirably answered the purposes intended to be secured in hotels on the continent. The principal thing was to have every floor perfect of itself, so as not to have the waiters going up and down. The waiters' rooms in these hotels should be placed as far as possible in the same position, and the bells placed in that locality where the waiters were, as had been carried out very successfully at the Great Western Hotel. Also accommodation should be made for the housemaid and for the taking up of coals by hoist without interfering with the principal staircase, and further accommodation of a similar character should be made, especial attention being paid to the coffee-room. Those were some of the great principles upon which these hotels should be constructed, and he believed that the points involved were very well carried out in the Westminster Palace Hotel, and in the London-bridge Railway Terminus Hotel, and he congratulated Mr. Moseley in having completed so great a structure as the former.

In answer to a question, Mr. MOSELEY said that in some cases kitchens had been placed in the roof, but there were objections to such an arrangement.

Mr. C. F. HAYWARD supposed the hoist was not meant to supersede the common staircase?

Mr. MOSELEY: Certainly not, but it was meant for the use of persons who preferred going up in that way to going up the ordinary staircase.

The CHAIRMAN supposed the perforating shafts for heating chambers would lead to a great consumption of fuel.

Mr. MOSELEY said it was not so.

The CHAIRMAN remarked that the general argument was that where there was an enormous quantity of heat going up a flue the stove was imperfectly constructed, and that there was, consequently, an imperfect combustion.

Mr. C. F. HAYWARD observed that the Marine Barracks at Woolwich, which was an excellent building, when erected, were laid with plaster floors, but those floors were being gradually taken up because of the cold. He should like to know if plaster floors were inconvenient, as such floors were very common.

The CHAIRMAN said one of his offices at the Indian establishment had these floors, which he covered with a thick felt, and the old Indians, though very sensitive gentlemen, had not found fault with the arrangement.

Mr. C. H. SMITH did not think a plaster flooring was objectionable, for a plaster floor was to a certain extent a better conductor of heat than a wooden one, although cold might be caused by a difference of temperature.

Mr. HAYWARD thought plaster floors were uncomfortable; he knew a case in point in Nottinghamshire, and the case at Woolwich to which he had referred had been thoroughly investigated, and the plaster floor was taken up and replaced by other materials.

Mr. BOULNOIS said the great difficulty with plaster floors was to prevent oil and dirt getting into them, which rendered it necessary to replace them. It was necessary, particularly in hotels, to clean the floors sometimes, but when that had been done several times cement would change its character, and eventually the floors would have to be taken up and replaced by some other materials. He knew a case of a plaster floor which had lasted ten or twelve years, but he thought it would have to be taken up some time or other.

Mr. FOWLER said metallic lava was a very useful material in the construction of floors.

Professor KERR moved a vote of thanks to Mr. Moseley and Mr. Currey for the papers read that evening. He was sure he spoke the opinion of every one present when he said that if anything was of more use to them as architects than another, it was bringing before them matters of detail, which were of great interest to them. And he thought Mr. Moseley might lay them under more obligations if he would give them some further information with respect to the plan of the Westminster Palace Hotel, particularly with regard to the basement, if he would point out to them where the kitchen was, how it was reached, where the larders were—a most important point in a London hotel—how the general arrangements with regard to offices were managed, and how the communication between the kitchen offices and the dining-rooms was carried out. It was of great importance in an hotel that facility of communication should exist between different parts of the building, and he should like to know how all this was effected in the new hotel at Westminster.

Mr. MOSELEY then referred to plans on the walls, and explained the arrangement of the rooms in the hotel, pointing out particularly the positions of the rooms for the manager, housekeeper, domestics, the visitors, servants

of the visitors, dining-rooms, bedrooms, &c., &c. The accommodation included five or six hoists for raising luggage, provisions, coal, letters, &c., besides the great hydraulic hoist for taking up visitors. He also stated that it was proposed to erect an hotel at Liverpool, to accommodate 800 persons; at present the scheme was *in nubibus*, but it was hoped the proposed hotel would be erected some day.

Mr. JENNINGS seconded the vote of thanks for the valuable papers which had been read that evening. The material to be used for floors was a matter that all architects should attend to, and he thought the material to be used for the formation of floors would be a matter for the consideration of future builders of hotels.

Professor KERR said Mr. Currey, in his paper, stated that he had made no attempt to make his hotel—that at the London-bridge railway terminus—fireproof—(A Voice: He said so). That seemed a most extraordinary thing. The essence of fireproof construction was not the making a building fireproof by the use of incombustible materials, but to make the fabric in such a way as that a fire should not be drawn through a hollow space and communicated to other portions of the building, thus leading to its destruction.

Mr. MOSELEY said that in the case of his hotel there was no chance of draught.

The CHAIRMAN, as representing the tenants of nearly one-half of the Westminster Palace Hotel, could bear his testimony to the soundness and substantial character of the building, which was tested by the great weight placed upon it by the Council for India. In this hotel the soil drains were made in flanged iron pipes, which was a great advantage, and kept away smells. Another point of importance was the very satisfactory way in which the whole had been floated on the surface, as it were, of a very bad bottom. He had not seen any sign of sinking in the walls, and, considering their thickness, he thought it was satisfactory the building had stood as it did. The principal entrance and staircase formed a very pretty part of the building.

A vote of thanks having been passed by acclamation, the meeting separated.

ARCHITECTURAL ASSOCIATION.

AN ordinary general meeting of this body was held at the Rooms, 9, Conduit-street, Regent-street, on Friday evening; Mr. BLASHILL in the chair.

The CHAIRMAN stated that the Association were now possessed of a book-ease, and would be glad to receive donations of books from the members and their friends. He said he had received a letter from Mr. B. A. C. Herring, stating that he was prevented from attending the last meeting to read a paper in consequence of illness, and expressing his willingness to read the paper on any vacant evening during the session.

Surface Decoration.—Mr. R. O. HARRIS then read a paper on "Surface Decoration," which will be found in another portion of this Number.

The CHAIRMAN said they had not much time left for the discussion of Mr. Harris's very talented paper, which contained a large mass of most interesting matter as to the modes of operation for the purpose of producing various kinds of surface decoration. Such a paper would be well followed up by one on design in decoration.

Mr. GEORGI gave some particulars respecting a table-top he exhibited, and which was referred to by the lecturer. The table is a scagliola mosaic, in imitation of Florentine marbles, and is, we understand, to be shown at the Great Exhibition.

Mr. PARAIRE suggested the adjournment of the discussion upon Mr. Harris's paper; and it was agreed that the discussion should be adjourned, and take place on the first evening an opportunity presented itself.

A vote of thanks having been passed to Mr. Harris, the meeting separated.

CAPITALS FROM THE OXFORD MUSEUM.

WE have illustrated, on another page, four capitals, selected from those executed in the new museum at Oxford. The building and its decorative features have been fully described in former volumes.

IRISH MEMORIAL TO THE LATE PRINCE CONSORT.

THE Lord Mayor of Dublin has addressed a letter to the Hon. Charles Grey expressing the desire of the Corporation and citizens that a memorial should be erected in Dublin to commemorate the exalted private virtues and eminent public services of the late Prince Consort. His lordship stated that in all parts of Ireland an equally unanimous wish prevailed that a suitable record of this universal feeling should be preserved. He, therefore, wished the subject of the proposed memorial to be submitted to her Majesty, with a view to receive her gracious sanction. To this communication General Grey has replied in the following terms:—I have the honour of receiving your lordship's letter of the 28th February, and, having taken the Queen's pleasure upon it, I am commanded to say that her Majesty cannot but be deeply touched by the assurance it contains of loyal attachment to herself and of sympathy with her in her sorrow, as well by the gratifying desire expressed to have a separate national monument erected to the Prince's memory in Dublin. It is no slight comfort to the Queen in her affliction to receive this proof of the affection and respect entertained for the Prince by her Irish people, and of their appreciation of his excellence; and though she does not know that any special sanction from her is necessary to enable them to give effect to their wish, she must assure them of her heartfelt concurrence in it, and of her best wishes for its successful accomplishment.

SIR CHRISTOPHER WREN.—At a meeting of the Photographic Society, held on Tuesday evening, Mr. Glaisher, F.R.S., in the chair, considerable interest was excited by the exhibition on the table of a series of photographs illustrative of the works of the renowned architect of St. Paul's.

The Emperor of Russia has just decreed the gratuitous concession of two hundred square yards of land, situated at Great Norkaia, Saint Petersburg, for the construction of a church of the German reformed religion.

Reviews.

The Year Book of Facts in Science and Art. By JOHN TIMBS, F.S.A. Lockwood and Co.

MR. TIMBS' annual volume is, as usual, full of interesting facts concerning topics which have been discussed during the past year. There is also in the volume for 1862 a biographical notice of Mr. W. Fairbairn, with a portrait. Mr. Timbs has so long exhibited an unparalleled industry, combined with good taste, as a collector, that we need do little more than recommend his book to the notice of our readers.

Report on the Vital, Social, and Economic Statistics of Glasgow for 1861. By JOHN STRANG, J.L.D.

THIS annual report by the Chamberlain of Glasgow contains very nearly all the information obtainable on the vital, social, and economic statistics of the city.

At the commencement of the present century Glasgow contained only 83,769 inhabitants; sixty years ago the customs collected at Glasgow amounted to £427 only; but at the last census the population of Glasgow was returned at 446,639; while the customs collected now amount to £924,505. Glasgow is a rising city.

Dr. Strang's report is most comprehensive; he treats on, and gives us facts relating to, the population, births, diseases, mortality, burial, house building, water supply, and many other matters. He tells us that the number of dwelling-houses within the parliamentary boundaries of Glasgow in the year 1861-62, under £5, amounted to 34,503, at £5 and under £10, to 33,120, and at £10 and upwards to 19,956, or to a total of 87,579. And when we compare the gross number of houses of 1859-60 with those of 1861-62, we find an increase in favour of the latter of 4,350. Considering the number of residences altered to places of business, and the vast increase of dwelling-houses erected beyond the limits of the parliamentary boundaries for the accommodation of many of the persons who are employed within the city, the increase seems greater than might have been expected. Under deduction of the persons residing in public institutions, which reduces the population to 389,110, the number to each occupied and unoccupied house is as 1 to 4.4 of the population. These houses are chiefly supplied with water from Loch Katrine. During the year 1860 the water from this highland loch, distributed on the north side of the river, amounted to no less than 18,000,000 of gallons. This prodigious consumption having attracted the notice of the Commissioners, an inquiry was made into the matter, when it was calculated that about 7,500,000 had been daily running to waste through old and leaky taps alone. The measures taken for reducing this waste succeeded so far as to reduce the daily consumption at the midsummer of 1861 to 15,000,000 gallons; but from the period when the Loch Katrine water was sent across the river into the west part of Gorbals the consumption increased to 17,000,000 gallons, and which, when added to the supply from the Gorbals works, made the total daily quantity supplied to the city and suburbs 21,000,000 gallons, or about 46 gallons per head of the population supplied. That this is a very large supply is shown from the following table, which was prepared in 1859:—

Towns.	Population within bounds of Supply.	Daily Supply.	Daily Supply for each Inhabitant.	Cost of Undertaking.	Daily Supply for every Pound expended.	Proportion Supply in Addition.
		Gallons.		£		
London	2,666,917	81,925,842	30.3	7,102,823	11.1	20,000,000
Paris	1,100,000	26,350,000	24	800,000	33	
Hamburg	160,000	5,000,000	31.25	170,000	29.50	
New York	713,000	28,000,000	39.27	1,800,000	15.5	14,000,000
Manchester	500,000	11,000,000	22	1,300,000	8.5	
Liverpool	500,000	11,000,000	22	1,640,000	7	
Leeds	153,000	1,850,000	12	283,871	7	2,000,000
Edinburgh	215,000	4,800,000	22.3	456,000	10.5	
Dundee	96,000	1,750,000	18.2	139,000	12.5	
Aberdeen	65,000	1,200,000	18.4	50,000	24	
Greenock	40,000	2,112,500	52.8	90,000	23.4	
Paisley	48,450	1,021,452	21	60,000	17	

It appears from this table that the daily supply furnished to Glasgow, is, with the exception of Greenock, the greatest among the cities enumerated. In fact, the supply is too great to be properly applied, and has educed among the inhabitants a feeling of carelessness and of waste that will be henceforward difficult to eradicate.

There are three model lodging-houses now opened in Glasgow. One is in Greendyke-street, with accommodation for 134 inmates. The accommodation is a sleeping berth for each person, opportunities for cooking on a hot plate, the necessary cooking utensils being supplied, lavatories with a plentiful supply of water, also soap and towels. There is a large sitting hall, which is supplied with newspapers and periodicals, also a library and reading-room; the hall is well lighted with gas, and comfortable fires are maintained in winter or in bad weather. The charge for this is 3d. per night, or 1s. 6d. per week of seven nights. There are more expensive berths at 4d. per night, or 2s. for seven nights; and at 6d., or 3s. per week. The number accommodated during the last year was 45,749.

The second establishment is in Macalpine-street, and can accommodate 298 males. The home consists of four flats, and has good accommodation for cooking; there is a large sitting-room on the ground floor where the inmates have the use of a small library, newspapers and periodicals—a smoking-room is also attached. Lavatories and water-closets are placed in connection with each ward. The charges are 4d. and 6d. per night, or 1s. 6d., 2s., and 3s. per week of seven nights. The numbers accommodated during the last year were 58,671.

The third establishment is in Carrick-street, which lodges 200 females. The general accommodation in this house is much the same as the males' home in Macalpine-street, the charges are 3d. per night, or 1s. per week of seven nights; a better class of accommodation is provided for 12, at 4d. and 6d. per night. The numbers lodged during last year were 25,231.

With respect to the sewerage of the city, the total length of the main sewers within the municipal boundary is 60 miles, and within the built portion of the

city nearly all the streets are provided with sewers. In the suburban districts of Camlachie, Westmuir, Parkhead, Springburn, and Woodside, there are no common sewers, the open water courses forming the only drainage. The sewerage of the districts of Bridgeton and Mile-end within the built portions of the city is limited, arising from the difficulty of obtaining an outfall without increasing the nuisance in the Clyde above the weir. A survey, however, is in course of being made to provide a remedy for the imperfect drainage of these districts.

Croydon Sewage v. London Sewage.

CONTAINS some remarks on the proposition to discharge a portion of the sewage of the parish of Croydon into a sewer under the jurisdiction of the Metropolitan Board of Works, at Bell-green, in the parish of Lewisham.

CHURCH AND SCHOOL BUILDING.

Winchester Cathedral.—Workmen are engaged in excavating the ground in front of the west end of the church, so that the descent to it shall be by steps at the distance of 10 feet from the building, instead of immediately into the three porches.

Bicester Church.—The sub-scriptions in aid of the proposed restoration of this edifice amount to upwards of £1,250.

Liverpool.—St. Paul's Church, Tranmere.—There is now every prospect of this church being completed by the addition of a tower and spire, designed by Messrs. W. and J. Hay. Mr. Thomas, of Oxtou, who has erected the new church and parsonage at Frankby, now on the eve of completion, under the same architects, is the contractor employed, and has undertaken to complete the work by the 1st of July next.

Decon.—New Church.—It is stated that a new church is to be built for the parish of Withycombe, near the town of Exmouth. One gentleman has offered £1,000, and two others £500 each.

Newmarket.—All Saints' Church.—It having been deemed expedient to add to the sitting accommodation, the old pews have been replaced by open seats. Not a vestige of the old interior woodwork is now to be seen in the church, and the whole edifice has undergone a thorough change in its appearance. The pulpit and reading-desk are erected near the communion rails, one on each side of the church. The side entrance has been bricked up, and a new one opened under the tower; a small sacristy has been erected at the east entrance of the chancel; the pillars of the nave have been cleaned, and a window, with new stonework, has been put in the chancel.

Collingbourne Kingston.—The parish church, which has been closed for repairs, was recently re-opened. A sum (including the value of old material, estimated at £200) considerably exceeding £1,500 has been expended on the restoration. The architect has been especially careful, in carrying out the required improvements, to preserve the original character of the fabric. The fine Norman arcade, dating back as far as the eleventh century, has been restored. The chancel arch has Purbeck marble shafts, supporting foliated capitals. An unsightly gallery has been removed, and, through the munificence of the Marquis of Ailesbury, the belfry floor has been converted into a baptistry. It has a new font, a carved screen, and floor of encaustic tiles. The chancel, which is in the hands of appropriators, has not participated in the restoration, and its appearance contrasts painfully with the other parts of the building.

Lincolnshire.—The church of All Saints, near Epworth, consists of nave, north and south aisles, chancel, and chancel aisle, south porch, and tower at the west end. The chancel has recently been "renovated," but it appears the work done is not faultless, as the plaster in some places is already falling from the walls. The improvement in the chancel having been effected, the incumbent consulted with several parishioners with the view of extending the work to the nave and aisles, the pillars, arches, and walls of which were enveloped in numerous coats of colour-wash that had completely obliterated the work of the Mediaeval architect. In removing the whitewash the stonework was found to be covered with various colours—red, blue, and black. On the west wall a fresco was discovered: the subject of the Judgment was commonly represented on this wall, or over the chancel arch. In removing the soil in the chancel for the erection of the stove a stone coffin was found. In the south wall, near the place of sepulture just referred to, are sedilia. And near the east end of the same wall is a piscina. In the west wall is an aperture, but it can only be seen in the tower: from it a view of the high altar was obtained, and a bell rung therefrom to call attention to the more solemn parts of the service. There are two altar brackets—one in the south and the other in the north aisle. That in the south aisle is enriched with foliage. The circular font, which has been removed from its original and proper position, is of the same date. The tower is late Perpendicular; and the south porch contains some rich work of the same date. All the easternmost windows have been filled with stained glass by Mr. Wailes, of Newcastle.

Northamptonshire.—Disgraceful State of Ringstead Church.—Says a local authority:—"This once pretty and neat-looking church is in a most deplorable state, and is rapidly going to ruin. Two years since it could have been put in complete repair for about £200, but in two years hence it will require not less than £900 or £1,000 to effect an efficient reparation. It has been closed for some time. The gates of the churchyard have had all the rails taken from them; the churchyard wall is falling into the street, and the yard itself is the resort of all the idle and mischievous urchins of the place, who commit every possible act of violence and ill-usage on the sacred edifice. The graveyard is in a most disgraceful state of neglect. There is scarcely a whole pane of glass in the entire edifice, whilst in many places the window-frames have been taken out and flung into the interior of the church, so that the mischievously disposed have not the least trouble in procuring admission into the body of the church and committing acts of sacrilege. The interior of the church presents a most deplorable spectacle. The pavement is strewn with broken glass, remnants of window-frames, stones, brickbats, dust, &c. The stove remains intact, but all the iron piping is gone. The dust-covered pulpit wears an air of utter desolation, and all around is exposed to the effects of wind and rain. The spire exhibits signs of decay, and the walls require repairs in many places. Surely something might be done to remedy this sad state of things. If a church rate cannot be procured, the voluntary system might be found efficacious in removing the scandal. The church contains some interesting portions: the tower and spire, piers, arches, and some portions of the walls are Early English; other portions are Decorated, with fine tracery in some of the windows; and there are three stalls, a holy water drain, and aumbry in the chancel. The font is

plain, but has good moulded shafts. What a reflection is the present state of the church upon its custodians."

Liverpool.—New Free Church.—The foundation-stone of a new Free Church, to be erected in Gore-street North, was laid last week. This church, when completed, will consist of chancel and nave 90 feet long by 30 feet wide, organ chamber 20 feet by 20 feet, and south aisle 70 feet by 20 feet, with wooden belfee over the arch which divides the two latter. As the ground falls towards the west end, a class-room, 28 feet by 20 feet, is obtained under that part of the aisle. It is only proposed to erect the south aisle at present as a mission chapel; the organ chamber will, therefore, in the meanwhile serve as a chancel. The aisle is divided into five bays by buttresses and two-light windows on the south side, and the chancel into two bays, the north side being left blank for future enlargement in that direction. The height of the interior to the ridge is about 40 feet, and to the top of the wall 21 feet. The building is to be erected of brick, with stone dressings, and all the timber work to be of fir, stained and varnished. Middle-Pointed Gothic is the style adopted. On the south side, and one bay from the west end, is the entrance door. There are to be no benches or fixed pews, but the whole space is to be free and unincumbered, floored with red and blue tiles, and provided with chairs which can be set or removed at pleasure. The table, with the communion-railing, the pulpit, the reading-desk, and font, are not included in the contract, they will form gifts to the church from those who are charitably disposed. The present portion of the building is to cost £1,500. Mr. Tomkinson is the builder, and Messrs. W. and J. Hay are the architects.

SCHOOLS.

Stourbridge.—The grammar school premises have been rebuilt, with a frontage to High-street, of 101 feet. The style adopted for the buildings is the Perpendicular, from a design by Mr. T. Smith, of Stourbridge, architect. The main entrance is under a tower 60 feet high, which is approached from the street by a broad flight of stone steps. The residences are approached from the street by a terrace, which has an ornamental pierced wall and iron gates. The end of the school towards the street is semi-octagonal, buttressed at the angles. The three faces have windows with tracery in the heads. The roof is of high pitch, and covered with black and red tiles in bands. The school is a parallelogram of 52 feet by 22 feet 6 inches. It is 30 feet in height. Internally the roof is supported by hammer-beam principals resting on stone corbels. The ceiling is ribbed and carved at the intersections. Light is obtained from the three windows at the street end before mentioned, which form internally one large bay, and at the opposite end by a lofty four-light traceried window, recessed into a deep square bay. A lecture hall, 39 feet by 17 feet, is entered by an archway and lobby at this end of the school. The tower is surmounted by a cupola, forming a chamber for a clock and three bells. An angle turret is projected at the school floor level in the master's lobby, upon carved corbels, and by a spiral stair access to the roof, gutters, and clock chamber, is obtained. The entrances have arched doorways, and all the windows have cusped and labelled heads. The parapets are crenellated and broken by gables of high pitch. Owing to the want of funds much of the carving has been left in block, except the arms of the royal founder. The crocketed finials, the rose, portuculis, fleur-de-lis, crown and badges, and the corbels and drip-stones, and tower, have been executed. The playground is entered from the school lobby, and is fitted with a gymnasium. The cost of the work as carried out, including purchase of additional frontage, is about £3,050. The builder is Mr. Nelson, of Dudley.

NOTES FROM THE PROVINCES.

Clifton Suspension Bridge.—Messrs. Hawkshaw and Barlow, the engineers for this work, have reported that a contract has been entered into with Messrs. Cochrane and Co. for taking down the chains of the Hungerford-bridge and re-erecting them at Clifton, and for the supply and erection of the whole of the additional ironwork, and other work necessary for the construction of the Clifton-bridge, and the suspended portion of the roadway. The time at which the chains will come into possession of the Clifton Bridge Company depends upon the rapidity with which the construction of the new bridge at Hungerford advances. Judging from the progress already made in that work, they recommend that the preliminary operation of preparing the anchorage and piers at Clifton for the reception of the chains should be commenced at Midsummer of the present year. The examination and re-arrangement of the links of the chains, and the construction of the new links and other ironwork, will proceed simultaneously with the preliminary operations at Clifton.

Colchester Camp.—The formation of the artesian well in connection with the new camp at Colchester is now being pushed forward, the borings having reached a depth of nearly 200 feet. The contractors for the new cavalry barracks have not yet commenced the works, and it is said an extension of one month has been given them in consequence of the still heavy works to be completed upon the building for the Great International Exhibition.

Ross.—A new building has been erected in this town for a corn, cheese, butter, and poultry market. The cost has been £2,500, which was raised in shares. In addition to the accommodation for agriculturists, there are also rooms for the library of the Mechanics' Institute, reading-rooms, &c.

Residence of the Bishop of Gloucester and Bristol.—Efforts are being made to complete the Episcopal Palace for the Bishop by the Triennial Festival, which will be held in Gloucester in August or September next. Several old houses have and are being pulled down to improve the aspect and increase the garden. The new building occupies the site of the old Palace. The only portion spared being part of the great hall in the centre of the building. The cellarage under it being substantial and spacious, it was determined not to remove it; and it was intended that the walls and the roof should be retained, until it was ascertained that they were much dilapidated, and they have therefore been taken down and rebuilt. The building is 180 feet long by 60 feet wide, and forms two wings, one eastward and the other westward of the Abbot's-hall, communication being made through the great hall with the two wings. The east wing is intended for the Bishop's residence, and the west wing for the episcopal business. The latter contains the library and waiting-room, and over them several bed-rooms, &c.

Leighton Buzzard.—At a meeting of the directors it was resolved that the contract for building the new Corn Exchange should be given to Messrs. Osborne Brothers, of Leicester, and that they be requested to commence the same without further delay. Those present were of opinion that a stone front would be far more substantial and preferable to one covered with cement; they

therefore came to the resolution to have a stone one, as provided in the original specification; and to meet the additional expense two of the directors subscribed £50 each.

Budleigh Salterton, near Exeter.—A public assembly-room has been opened at this place. The principal room is 50 feet long by 28 feet wide, and 18 feet high. There are committee-rooms attached, together with a residence for a person to look after the premises. The building is in the Italian style, with cement dressings. The ceiling is panelled, with ornamental ironwork, acting as ventilators. It will accommodate about 500 persons. The architect is Mr. W. T. Cross, of Exeter. R. Burch, of Budleigh Salterton, was the contractor.

Melrose.—It is proposed to erect a corn-exchange here, which will be suitable for lectures, concerts, sales, &c., for which there has hitherto been no proper accommodation. A site in the market-place is thought most suitable. The total cost is estimated at £2,000.

Bath.—A report, to be submitted to the Town Council at its next meeting, has been published, embracing the suggestions of the Market and Borough Property Committee, for improving the Bath Market and the approaches thereto, according to the plans prepared by Messrs. Hicks and Isaacs, architects. The summary of the whole expenditure involved in the erection of the works is estimated as follows:—The market improvement, £6,120; new entrance from Bridge-street, &c., £1,600; new slaughter-houses, £1,400; the purchase of Bruce's premises, £180; total, £9,300. The committee, in conclusion, state that, assuming the total as not exceeding £10,000, they would suggest that £1,000 of that amount should be charged as an extraordinary expense against the borough fund for the year beginning September 1st, 1862. For the remaining £9,000, supposing it to be raised by mortgage or bond, they have good reason for believing that the annual surplus hereafter accruing from the water rents will reach a sum of £800 per annum, which would be more than adequate to provide for the interest of the money borrowed, and repayment of the capital by annual instalments, without any addition to existing rates on the burgesses.

Deal.—The Admiralty have given their assent to the construction of a pier at this place on iron piles, stretching 920 feet out to sea, with a general width of 20 feet, and, at the head, of 40 feet; height of platform above high-water mark, 13 feet, and an average depth at the head of the pier at low-water spring tides of 10 feet, so as to insure landing and embarking at all times of tide.

Wilson Monument, Paisley.—A monument is about to be erected at Paisley to the memory of Alexander Wilson, "Paisley poet and American ornithologist." The design has been selected in competition, and is by Mr. J. Mossman, of Glasgow. A figure of the Ornithologist stands beside the trunk of a tree, his rifle beside him, and his sketch-book on the ground. He has just shot a bird, and holding the specimen in his hand, he regards it with observant and contemplative look. The figure is to be of bronze, 7 feet 6 inches in height, standing on a massive pedestal of Aberdeen granite, 9 feet 6 inches high—the united height of pedestal and statue being thus 17 feet. The subscriptions on hand amount to nearly £500, and about £100 more will be required to complete the work.

Morgan Hospital.—This new hospital, says the *Dundee Courier*, which is to be placed on a triangular-shaped park at the junction of the Pitkerro and Forfar Roads, is in the Scotch Baronial style of the sixteenth century, and with various French features introduced, consists of four façades, enclosing an oblong court, 125 feet by 50 feet. The principal entrance front is 183 feet long. In the centre of this front is a lofty square tower, slightly projecting beyond the line of the rest of the front, and containing the chief entrance to the building. The tower is 20 feet broad at the base, and terminates at a height of 90 feet, in a steep slated roof, finished with an ornamental iron ridge. At each of the four corners of the tower, and 40 feet from the ground, is a boldly corbelled out circular turret, carried up some feet above the tower, and capped by a steep slated roof, terminating in a pinnacle, at nearly the same height as the roof of the tower. The tower is flanked on each side by a large bay-window, on corbels at the level of the first floor, and rising up into a gable, with crows steps. At each end of this elevation is a crows-stepped gable, projecting 11 feet beyond the main line of front. These gables have on their angles ornamental shafts, with carved bases and capital. In the centre of each gable is a corbel, from which springs a shaft with base and carved capital, supporting a chimney stack on the apex of the gable, and on each side of this corbel shaft there is, in the first-floor, a large window, in the head of which is carved tracery. Between these gables and the tower on each side is a large mullioned and transomed window. This and the two flank elevations are two stories in height, with a steep roof, with ornamental ridge. The flank elevations, which are 120 feet long, correspond in style with that already described, but are varied in design. The portion of the east elevation, devoted to the chapel is of ecclesiastical character. Entering the building by the principal door in the tower there is an entrance hall 20 by 16 feet, at the further end of which is a large oriel window looking into the inner court. On each side of this oriel runs the main corridor of communication, 8 feet wide, and lighted by windows looking into the court. At the end of the corridor, on the stairs to the upper floor, on the right-hand side of the entrance hall, are three class-rooms, 30 by 22 feet; boys' dining hall, 45 by 24 feet; master's and matron's dining-room; master's private-room; lavatory, &c. And on the left side of the entrance hall are the trustees' room, 25 by 21 feet; clerk's room and safe; library for the boys; two rooms for the matrons; and two stores for keeping boys' clothes. Communicating with this end of the corridor, but also provided with a separate entrance from the grounds, is the master's house, of seven rooms, besides kitchen and servants' accommodation. The kitchen offices of the hospital occupy the fourth side of the square, and are connected with the main part of the building by a covered passage running round three sides of the court. The accommodation provided in them on the ground floor consists of a kitchen, 25 by 21 feet, scullery, pantries, laundry store, washing-house, and drying closet; and in a sunk cellar a depot for coals. In a second story, above the back entrance, are a laundry and two large bed-rooms for servants. The upper floor of the principal building is occupied by large dormitories, with windows on both sides; and there are also two dormitories on the east side of the building. The total superficial area of the dormitories is 4,266 feet. Above the dining hall is the chapel, and at the south-west corner of the building, and shut off from the rest of the hospital, is an infirmary of two rooms, with bath, &c., scullery, and nurses' room; lavatories and baths are also provided on this floor.

Cavalry Depot, Maidstone.—"We are sorry to hear," says the *Maidstone Journal*, "that orders have been received postponing the rebuilding and enlargement of this garrison for the present. This step has doubtless been taken from the pressure upon the finances of the country."

TENDERS.

FARM-HOUSE, CHANTRY.

For a small farm-house at Chantry, on the Stagshaw estate, belonging to Robert Haythorn, Esq. J. E. Watson, architect, Newcastle-upon-Tyne. Quantities not supplied.

Rider	1,780		

COMPETITIONS OPEN.

BRIDGES.

BRISBANE RIVER.—The Municipality of Brisbane are prepared to receive designs and tenders for the construction of a bridge over the Brisbane river, at Brisbane, the capital of Queensland. The author of the best design, at the lowest cost, will receive a reward of £150, or be employed to carry the work out, providing he furnishes sufficient proof of his competency and experience in similar undertakings. A premium of £50 will be awarded to the next best design, and £10 for the next best. The plans, specifications, and estimates of the first and second designs will be retained by the Corporation as their property. The remainder will be returned to the competitors; but the corporation will incur no responsibility as to their safe delivery. Each set of drawings, and the documents accompanying them, are to be distinguished by a motto only, and accompanied by a letter in a sealed envelope, marked with the same motto, and containing the author's name and address, and such testimonials as he may think proper to furnish. Professional judges, being non-competitors, will be appointed by the Corporation to determine the merits of the respective designs. Eligible tenders for the work, accompanying the design, will be entertained. All drawings and tenders to be delivered at Gresham House, on or before the 15th of March next. Copies of the instructions to competitors, and the

plan of the city, can be obtained of F. Mangles and Co., the Colonial agents, and agents to the Municipality of Queensland, 88 to 88, Gresham House, Old Broad-street, London, E.C.

DUBLIN.—The committee appointed to carry out the new Carlisle bridge (Dublin) scheme, require plans and specifications for the erection of the structure on the present site, the full breadth of Sackville-street. £200 will be paid for the best and most approved plan, £100 for the second, and £50 for the third. The plans, &c., to be the property of the committee, to whom applications are to be made at the Imperial Hotel, Sackville-street, Dublin.

INFIRMARY.

LONDON.—The managers of the Central London District School desire to have designs for a detached infirmary for their boys' and girls' schools at Cuckoo Farm, Hanwell. The building must be of a simple and inexpensive character, in harmony with the existing buildings, and comprise accommodation as required by the Poor Law Board for 180 boys and 180 girls, each sex to be separately distributed in six rooms. There must also be a kitchen, surgery, waiting-room, and other necessary offices underneath. Particulars on application to the superintendent at the schools. The plans must be drawn to an uniform scale of 8 feet to an inch, each to be accompanied by a specification of the works and an estimate of their cost. No premium will be given, but the architect whose plan is chosen will be paid by commission for supervision, &c., of erection of the building in the usual way. Each set of plans must be subscribed with a motto, and forwarded with a sealed letter, containing the motto and the author's name, to Samuel Heath, Jun. clerk to the Board, No. 10, Basinghall-street, E.C., on or before April 2.

LAYING OUT.

TRANMERE.—The directors of the Tranmere Freehold Land Society desire plans, before the 25th March, for laying out and allotting the estate belonging to the Society, in Higher Tranmere; consisting of about 40 statute acres. Premiums will be given for the best and second-best plans. Each plan to be accompanied with an estimate of the cost of the formation and construction of the roads and sewers, and also of the laying out of the land. Particulars from Mr. John Quinn, Chairman of the Society, 22, Lord-street, Liverpool; or from Mr. H. P. Priest, Secretary, Market-cross-chambers, 19, Market-street, Birkenhead.

CONTRACTS OPEN.

MECHANIC'S INSTITUTE.

DUDLEY.—For the erection of a new mechanic's institute and public hall, at Wolverhampton-street, Dudley, in the county of Worcester. Plans, &c., at the office of Mr. William Bourne, architect, Tower-street, Dudley, to the 17th March. Sealed tenders, endorsed, "Tenders for Mechanic's Institute at Dudley," are to be forwarded to Joseph Stokes, solicitor, Wolverhampton-street, Dudley, Honorary Secretary, on or before the March 20.

MANSION.

SOUTHAMPTON.—For the erection of a mansion, &c. Particulars with Guillaume, Parmentier, and Guillaume, architects, &c., Southampton.

INFIRMARY.

LYMINGTON.—For the erection of a fever ward upon part of the workhouse premises in Lymington. A plan of the work, with specifications, at the office of Messrs. Colborne and Son, surveyors, Lymington. Sealed tenders to the Clerk to the Guardians at his office in Lymington on or before March 22.

PIER.

BLACKPOOL.—For the erection of an iron landing and promenade pier, for the Blackpool Pier Company, (Limited.) Plans, &c., on Monday the 3rd March next, at the office of Messrs. Birch, the engineers to the company, 43, Parliament-street, London, S.W., or at the Company's office, Blackpool; and bills of quantities will be furnished on payment of ten shillings. Sealed tenders by the 10th March next, addressed to the chairman of the Blackpool Pier Company, Blackpool.

CHURCHES.

BIDEFORD.—For rebuilding Bideford Church. Plans, &c., on application to the rector, till the 2nd March. Sealed tenders addressed to the secretary, on or before March 10th.

PRESTON.—For the erection of the whole or any portion of a new church, to be built at Preston. Plans, &c., at the Upper School-room, Wellfield-road, Preston, and also at the office of the architect, Mr. E. G. Paley, Lancaster, to 18th March, inclusive. Tenders to be sent in under cover to Rev. Thomas Clark, West Cliff-terrace, Preston, endorsed "Tender for St. Mark's Church," on or before March 22.

CHAPEL.

BRISTOL.—For the erection of the Clifton Wesleyan Chapel. Drawings, &c., with Fosters and Wood, architects, 6, Park-street, Bristol, till the 28th inst., on or before which the tenders are to be sent to the architects, sealed and endorsed "Tenders for Clifton Wesleyan Chapel."

VICARAGE.

MONMOUTHSHIRE.—For the erection of Caerleon Vicarage-house, three miles from Newport, Monmouthshire. Plans, &c., at the King's Head Hotel, Newport; and tenders may be sent to Richmond and Seddon, diocesan architect, 6, Whitehall, London, on or before the 15th of March.

SCHOOLS.

ESSEX.—For the erection of new school buildings at Great Holland, Essex. Plans, &c., at the office of Mr. H. W. Hayward, Bank-buildings, Colchester, the architect. Tenders to be sent to the Rev. R. Joyes, Great Holland Rectory, near Colchester, on or before the 11th March.

DWELLING HOUSES.

SOUTHAMPTON.—For the rebuilding of the house and premises, No. 9, Middle East-street, Southampton. Plans, &c., at the office of Mr. E. T. Howell, surveyor, Hanover-buildings, Southampton.

POLICE-STATION.

DEVON.—For the erection of police station, &c., at Northtawton, Devon. Plans, &c., with Henry Ford, Clerk of the Peace, Castle of Exeter, and at the office of Robert Fulford, Esq., clerk to the Justices, Northtawton. Sealed tenders endorsed, "Tender for Northtawton Police Station," to be sent to Mr. Ford on or before the 1st April.

MILITARY WORKS.

SCOTLAND.—For contracting from 1st April, 1862, to 31st March, 1865, inclusive, for the performance of such artificers' work as may be required at the under-mentioned stations, viz.:—Edinburgh Castle; Piershill Barracks; Leith Fort, Martello Tower, and Blackness Castle; Greenlaw Military Prison and Barracks; Perth Barracks; Dundee Barracks and Broughty Castle; Dunbar Barracks; Berwick and Holy Island; Glasgow Barracks; Dumfries Castle; Paisley Barracks; Hamilton Barracks; Ayr Barracks; Fort Matilda; Stirling Castle; Aberdeen Barracks; Beach and Torry Point Batteries; Forts George, Augustus, and William. In all cases, the seven trades are to be in one tender for each station, and the contracts to be determinable at any period after the first year, on either party giving to the other three months' notice in writing. Any person may tender for one or more of the above stations. Parties applying for forms of tender must give sufficient guarantee to the entire satisfaction of the commanding royal engineer of their being fully competent to undertake and execute any new works or repairs that may from time to time be ordered on the contract schedules. Every information on application to the Royal Engineer or Barrack officer, at the several stations herein named, together with printed schedules of the prices, with the terms of contract and letter of tender for the several descriptions of artificers' work, to the 27th February, upon making a deposit of five shillings for the same. The letter of tender to be sealed, and transmitted under cover to the Director of Contracts, War Department, Pall-mall, London, S.W., so that it may be received on or before the 10th March, 1862, and to be marked on the left-hand corner of the envelope, "Tender for Works at _____."

GUERNSEY, &c.—For the usual triennial contracts for works and repairs to War Department Buildings in the Islands of Guernsey and Alderney. Schedules of prices and forms of tender (for which ss. 3d. for each set will have to be deposited), and all other information may be had on application to the surveyor, at the office of the Inspector-General of Fortifications, War-office, Pall-mall, London, S.W.; and at the Royal Engineer-offices in

Guernsey and Alderney. Tenders will be received by the "Director of Contracts," War-office, Pall-mall, London, S.W., on or before the 20th March.

DUBLIN.—For the performance of such artificers' work as may be required at the under-mentioned stations, from the 14th April, 1862, to 31st March, 1864, inclusive, viz.:—Dublin District, as per schedule B, Athlone, with 5 per cent. in addition for rifle range; Mullingar, with 8 per cent. in addition for rifle range. The contracts to be determinable at any period after the first year, on either party then giving to the other three months' notice in writing. Information to be had at the District Royal Engineers' Office, Dublin, and at the Royal Engineers' Office, Athlone, or to the Barrack Master at Mullingar; and printed schedules of prices, with terms of contract and letter of tender, may be had on depositing 10s. Tenders sealed to be transmitted under cover to "The Director of Contracts, War Office, Pall-mall, London, S.W.," marked on the outside "Tender for Work at Athlone or Mullingar" (as the case may be), before March 15th.

ROADMAKING, &c.

IRELAND.—For the following works, in the barony of Gorey, in the county of Wexford:—1.—For making a new line of road from the corner of the Post-office in Gorey, to Edward Foley's cottage in Ballyrabeen, containing about 415 perches; not to exceed £500. 2.—For making a new line of road from Gorey to Tinahely, containing about 300 perches, in the townland of Ballingarry. Plans, forms of tender, &c., obtained, at the office of Henry E. Wynne, secretary to the Grand Jury, County Court House, Wexford.

PAVING, &c.

NEWINGTON.—For the supply and doing of such paving and curbing to the extent, as to paving, of about 60,000 feet super; and, as to curbing, to the extent of about 14,000 feet lineal; and also for the supply of such broken granite (Guernsey, Bombay, and Port Phillip), flints, Kentish rag, gravel, and smith's work, as the vestry of St. Mary, Newington, Surrey, may require of the contractor, from the 25th March next until the 25th March, 1863. Particulars, &c., with H. and F. Chester, joint clerks to the Vestry, 1, Church-row, Newington-butts, to whom tenders must be sent before 6 p.m. on the 10th March, and the several persons willing to contract must attend the Committee at 7 o'clock on the same evening.

SEWERAGE, &c.

DUMFRIES.—For constructing and completing a main sewer and its appurtenances, in the White Sands, Dumfries. The sewer will be about 500 yards in length, and to be built of bricks with fire clay invert blocks. The section, &c., with James Barbour, C.E., Buccleuch-street, Dumfries; and tenders to be lodged with William Martin, town clerk, on or before 20th March.

SUPPLY.

HACKNEY.—For the supply and execution of the undermentioned works and materials for the Board of Works for the Hackney District. Cartage for the period of three years, from the 25th of March next, for the parishes of Hackney and Stoke Newington, for the cartage of materials, slop, rubbish, and road grit, &c. Materials, &c., for the period of one year, from the 25th day of March next, for the parishes of Hackney and Stoke Newington. For the supply of glazed stoneware sewer and drain pipes. For the supply and delivery of ballast, shingle and hoggins; for the supply and laying down of York paving, and granite curbing; also for repairs to the existing footways; for the supply and fixing of lanterns, lamp-heads, stand-pipes, and service-pipes; removing, altering, and fixing lamp-posts; for the supply of cast-iron covering plates, flushing-hoses, and gully-grates, &c., for sewers work; for watering Newington ward; De Beauvoir Town ward; Dalston ward (part of); South Hackney ward (part of); Shacklewell (part of). Forms of tender and further particulars at the office of Mr. James Lovegrove, C.E., surveyor to the Board; Town-hall, Hackney, between nine and eleven o'clock, a.m. Tenders to be sealed, endorsed, and addressed to Richard Ellis, clerk, and delivered at the Town-hall, Hackney, on or before the 12th of March. The parties tendering, or their representatives, must attend at the Board on the 13th, at eleven o'clock precisely.

CHELSEA THOROUGHFARES.—A great improvement in our public thoroughfares has just been completed in King's-road, Chelsea. The dead wall which hid the Duke of York's Asylum for boys, has been pulled down and set farther back, thus providing a pathway which has been long required. The new pavement is six hundred feet long by seven feet six, and was entrusted by the vestry of Chelsea to Mr. William Byram, stone merchant, of Druce's Wharf, Chelsea. Mr. Byram, desirous of setting a good example to employers and employed, has invited the masons and men to a good old English repast, to commemorate the completion of an improvement so long demanded. By the way, Chelsea is, perhaps, the only metropolitan parish that is taking active measures to improve the public thoroughfares for the traffic which may be expected this year.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

A GRAINER (Oswestry).—Write to the Secretaries, 9, Little Trinity-lane, City.

THEODORE.—Will doubtless find the information required given elsewhere.

H. J.—Received.

D. W.—If cottages are meant, Vincent's work is a good one.

G. S. (Leicester).—Opinions differ; perhaps a warm neutral is the best colour.

A. A. B. (Dabriscan).—Thanks for tracing.

T. S. (Sheffield).—Much obliged.

G. E. T.—We cannot recommend societies.

SUBSCRIBER.—Shall be attended to.

J. T.—Too late.

Z. A.—Ditto.

S. E. D.—Drawing shall be engraved.

J. C.—Deferred for want of space.

H. B. C.—Below our mark.

BRISTOLIAN.—We do not like to interfere on ex parte statements.

J. O. F.—Shall appear.

F. W. (Ipswich).—A very wide question; and, unless we know more definitely what is

T. X. G. R. A. F.—Send name and address.

L. F. E. Z.—Shall hear from us.

JOURNEYMAN MASON.—Hint shall be kept in mind.

F. B. R.—We cannot find address.

THAMES EMBANKMENT.—Perhaps.

D. W. B.—Declined with thanks.

G. E.—Send plan; view shall be engraved.

T. E. R.—Next week.

K.—Refer a statement of facts to the head of the department.

ROYAL ENGINEERS.—We cannot help it; can R.E. point out where we are wrong?

D. I.—Who writes under several signatures, must not hope so to impose on our credulity. If the matter had deserved attention it would have received it.

B. F.—Let us see rough sketch.

F. E. Z.—Ditto.

NOTICE.

The Seventh Volume of the BUILDING NEWS is now ready, bound in cloth, price 21s. Subscribers can have their copies bound, either with or without the advertisement pages, for 4s. 6d., on sending them to the office. Cases ready for binding the volume may be had price 2s. each.

* All communications to be addressed, The Editor of the BUILDING NEWS, 20, Old Boswell-court, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 15 to 21, Old Boswell-court.

Advertisements are received up to six o'clock on Thursdays.

THE DESTRUCTION OF CITY CHURCHES.

BMID the bloodiest and darkest days of the first French Revolution there was formed a band—*la bande noire*—of speculative individuals, who assumed the utilitarian mission of converting into money, or to some purpose of practical utility, the architectural monuments which the piety or refined taste of their ancestors had raised to the great embellishment of France. The Convention wanted money to equip armies as apostles to the rest of Europe of the Religion of Reason, and as pioneers of French civilisation; and the Black Band, in their patriotic anxiety to further these

ends, offered their money in exchange for structures raised by a haughty aristocracy and fanatical priesthood—structures which could be nothing more than obstructions to the new light which the *Etre Suprême* shed over France. So, under their black flag, inscribed *guerre aux châteaux, paix aux hameaux*, they went forth in bands, armed with sledge-hammers, crowbars, and pickaxes, and levelled to the ground cathedrals, churches, monastic structures, palaces, and mansions, where there were no other means of making money than from the

sale of old building materials. In districts where individuals offered to purchase from *la bande noire* confiscated edifices for conversion to useful purposes, care was taken to destroy statues, carved armorial bearings, and artistic ornaments, in order to efface traces of the inequality and superstition which previously existed. From the northern provinces, dotted with Flemish and the best French interpretations of Gothic art; through Normandy, with its stately feudal castles and masculine styles, uniting force and grace into forms of beauty; through the valley of the Loire, where the pleasing works of the Renaissance stand on noble terraces sweeping down to the river; on to Limoges, where two styles of art may be said to have met; on their way northward, from the Lombard and Venetian cities of Italy, and from the Moorish towns of Spain, the destroyers passed, leaving a broad tract of senseless, purposeless, and irreparable desolation behind them.

The Convention—ignorantly indifferent as the members were to the opinions of posterity, and careless of everything that did not gratify their political passions—did not venture directly on works of destruction, although clearly responsible for the vandalism of *la bande noire*. In justice we should, perhaps, make a distinction between the Convention and the government of the Convention. If the Executive sold architectural works to ruthless destruction, the Convention, or some of its members, strove to preserve the artistic inheritance bequeathed by the past. An ex-bishop of Blois, a Conventionist, indignant at the degradations and destructions—for which he invented the term vandalism—perpetrated in the provinces, made several reports, and at last obtained decrees rendering the constituted authorities responsible for the preservation of national monuments and libraries. Of the buildings the Convention decreed national property and took possession of in the name of the nation, it did not openly proceed to destroy any, but converted them to some *quasi* useful purpose. In Paris the Archbishop's Palace was united to the well-known hospital, Hotel Dieu, and the conventual structures were most of them transformed into hospitals. Such was the destination of the Abbey St. Antoine, of the Benedictine Convent Rue de Sèvres, of the Monastery Panbourg St. Jacques, of the Convent at Chaillot, the College Montaigu, the Convent of Val de Grace, and others. A Jacobin convent was transformed into an artillery museum. The Abbey of St. Martin was made the Conservatory of Arts and Trades, and the church is now a library. We scarcely remember an instance of the Convention pulling down a church, though it may have desecrated many. And it is, therefore, all the more surprising that what the Convention dared not do when its political and irreligious madness was at its height should be proposed to be done in London, under the patronage of the Bishop, and when we are at the full flood of a religious revival.

A statement has been going the round of the press that the Post-office authorities have offered a sum, varying from £40,000 to £80,000, for the site of the church of St. Mary Woolnoth, to construct the Lombard-street branch thereon. This structure will, therefore, if the parishioners consent thereto, be forthwith demolished, and will be the first church

taken down under the Bishop of London's new Act, the 22nd article of which provides that the proceeds of the "first sale of property or materials" shall be appropriated for the payment of expenses incurred, retrospectively or prospectively, in carrying out the provisions of the Act; "And the same fund shall from time to time be augmented by the Ecclesiastical Commissioners from the produce of similar sales of property as there may be occasion." The written consent of the Vestry is necessary before the scheme can be carried into effect.

Sentiment is, doubtless, excessively foolish; but there are few Englishmen—excepting, of course, Bishops and Ecclesiastical Commissioners—who can contemplate with indifference the destruction of an edifice consecrated to the worship of God, and wherein our fathers were baptised, married, and solemnly dismissed to the grave through generations of men. The desecration of the graveyard—God's acre, as our fathers simply and reverently called it—is still more revolting to the laity. No consideration should be allowed to disturb the ashes of the dead.

Although this may be a matter of sentiment with Englishmen, and they may feel that they would suffer almost any personal inconvenience rather than pull down a church or disturb graves, it may be admitted that there are cases in which such proceedings may be tolerated—we cannot say justified. But every case must be judged by itself and *not en bloc*. Is there an excuse or necessity for the destruction of St. Mary Woolnoth? The excuse for the Bishop of London's Bill is, that in the city there are many churches without congregations, while, without the city, there are many congregations without churches. The city churches have rich endowments, and their sites are valuable; appropriate the endowments and prices of the sites of such churches as are unattended to the erection and endowment of new churches in the suburbs, says Dr. Tait. Certainly, the scheme looks very utilitarian—quite philosophical at first glance—but subsequent examination will show it to be the reverse. The first proposition of the advocates of the measure is that London contains nearly three million inhabitants and less than 500 churches, so 100 churches should be built. In this we may concur; by all means let us have the additional century of churches; but not old churches pulled down to build up new ones, for that would not alter the relative proportions of population and churches. Then, we are not sure that the figures represent the actual accommodation for religious worship. Turning to the last edition of the *Post Office Directory*, we find there enumerated 334 Established churches and 77 chapels of ease, 104 Wesleyan chapels, 100 Independent chapels, 89 Baptist chapels, 84 chapels of other Protestant Dissenters, making the total of Protestant places of worship 782. To these must be added 31 Catholic chapels, 10 synagogues, 8 Quaker meeting-houses, 7 Unitarian chapels, and 2 Greek chapels, giving the grand total of places of worship at 840 for a population of 2,803,534, as ascertained by the last Census, instead of the figures stated by the advocates of church destruction and extension. The figures as given corrected may not show that ample accommodation for public worship is provided in the metropolis, but they do prove that it is not so deficient as has been represented, for they show one place of worship for every group of population equal to 3,300 souls, instead of one for 6,000.

The history of church extension in the metropolis is well worth glancing at on the present occasion. When FitzStephen wrote, there were in London and the suburbs 13 conventual churches, and 126 lesser parish churches. Centuries later, when Stow compiled his "Survey," the number he gave for total was the same, 139; of these 89 were destroyed by the Fire, and of them 35 were not rebuilt. This would leave 104, independently of the two cathedrals, at the close of Wren's labours. From 1680 to 1850 there were built, independently of those erected by the present Commissioners, 56 churches for new parishes and districts; and the present Commissioners erected, wholly or partially, 90 new churches up to 1850. Since then greater progress has been made, so that there is no room for charging the present generation with having neglected its duty in this matter.

Granted that the population has departed from the City churches, and that new churches are required in recently-formed districts, it does not follow that we should destroy what may now be unused. Before doing so—before resorting to so extreme a measure, we are bound to exhaust every other resource. The fabric of a church is not the property of a generation. We have only a life interest in it, and hold it in trust for those who may come after us. In common justice we cannot alienate it, unless it be in the interest of our successors. Were the number of churches within the City to be reduced to suffice the present resident population, there is no certainty the diminished amount of church accommodation will be adequate to supply the wants of the future resident population. There is just now a tendency to live out of the City; but, so far as the poor are concerned, that is because they are expelled. It is quite possible that a change may take place in the style of building, and that, as London grows larger, architects will give a vertical direction to the growth of London; that is to say, erect lofty houses of six or more stories. Should this occur—and there are not wanting premonitory symptoms of this change—

nothing is more likely than that the resident population will augment. There will then be no church accommodation for them, and it will be impossible to provide it, except at very disproportionate cost. Under these circumstances, the destruction of City churches now will be an act of cruel injustice, of culpable indifference, having regard to the contingent requirements of the future. It is the duty of centres of population, where church accommodation is required, to provide it out of their own resources. Dissenters do so, and maintain their pastors without State assistance or legacies from the past. Classing them all as Protestant Dissenters, the figures quoted above show that they have built and kept up 377 places of worship, while the Establishment possesses no more than 405. Yet Churchmen, as a body, are wealthier than Dissenters. Are we, then, to suppose that their faith is cooler, and that among them the lamp of sacrifice burns feebler or is extinguished? We are fully prepared to admit the weight of the rejoinder about the difference in cost of constructing a chapel and a church; but when we have done so, that does not disprove the existence of energy and devotion among Dissenters, and of lukewarmness among Churchmen. If the learning and eloquence of a brilliant episcopacy and priesthood cannot quicken the zeal of Churchmen for their faith to the length of making their sacrifices for church extension keep pace with the increase of their wealth, still we contend that church extension is not to be obtained by church destruction. With the recent examples of the munificent exertions of laymen in this direction—of Miss Burdett Coutts, the Misses Monk, Mr. Hubbard, and Mr. Beresford-Hope—the laity cannot be so torpid as it is made to appear. Its zeal would be quickened if the Church herself set the example. A belief is current that the revenues of the Church are ample to satisfy all existing wants, if properly administered. Laymen read of sees the holders of which receive princely incomes, and apply them to the enrichment of their families; of Church lands leased for inadequate rentals, that present incumbents may pocket large fines; and of other sources of revenue which are diverted from the service of the Church. A case in point has been just published, which, without assuming a personal character, will admirably illustrate our proposition with respect to the perversion or diversion of Church income. Finsbury prebendary is in the hands of the Ecclesiastical Commissioners, and yields an income of £7,000 a year. In seven years the income will rise to £66,000 annually. The greatest exertions are now made to prevent this sum being applied to the erection of episcopal palaces, and to enhancing the rank and dignity of deans, while Londoners are without sufficient church accommodation, and are asked to demolish the monumental works of their fathers to supply the wants of new localities. The income of the prebendary it is sought from the Ecclesiastical Commissioners to have applied to provide endowments for fifty existing churches now without them, and for one hundred new churches to be built. This would leave a balance of £26,000—or interest, at 3 per cent., on a capital of upwards of £860,000—for the erection of the fabrics. Surely here are means to provide the requisite church extension, without imitating the Vandals of the French Revolution. Let the Commissioners announce such an appropriation, and the laity will not be backward in aiding the good work to the utmost of their ability.

We have hitherto treated the question on general grounds, but if we narrow it to the case of St. Mary Woolnoth—and every case should be treated on its own grounds—the contemplated act of vandalism will appear particularly odious in an architectural point of view. St. Mary Woolnoth happens to be the *chef-d'œuvre* of Nicholas Hawksmoor, the favourite pupil of Wren; it was built in 1719. The exterior is original and bold, remarkable for the solidity of its appearance, heightened by deep rusticated work. If it does exhibit some trace of heaviness, it also shows an air of magnificence, combined with harmonious simplicity of decoration. The interior is effective and well proportioned, "sumptuously beautiful," and ornamented with bold and rich decoration, and the plan remarkable, withal, for classical simplicity and harmony. And this is the structure which all critics agree in praising, and is one of the few architectural monuments in the City, that is to be destroyed, under the sanction of the highest dignitaries of the Church.

INSTITUTION OF CIVIL ENGINEERS.

At a meeting of this Institution, held on the 4th inst., JOHN HAWKESHAU, Esq., President, in the chair, papers were read by Mr. E. L. J. BLYTH, member, "Description of the Loch Ken Viaduct, Portpatrick Railway," and by Mr. H. P. BRERETON, member, "Description of the Centre Pier of the Bridge across the Tamar, at Saltash, on the Cornwall Railway, and of the means employed in its Construction."

At the monthly ballot the following candidates were ballotted for and duly elected:—Sir John Benson, Messrs. J. F. Blair, D. Hutton, E. Johnston, J. Kershaw, T. E. M. Marsh, R. Milligan, R. Smallman, and W. G. Smart, as members; Messrs. H. H. Bigg, J. Gordon, J. M. Harkness, R. Hodson, J. Oliver, and J. Pickering, as Associates.

On Tuesday, the 11th inst., Mr. C. A. HARTLEY read a paper, entitled "A Description of the Delta of the Danube, and of the Works recently executed at the Sulina Mouth." The discussion was adjourned to the 18th inst., when, if time permits, Mr. James Abernethy will read "A Description of Works at the Ports of Swansea, Sillith, and Blythe."

THE ROAD ACROSS THE PARK.

AFTER repeated attempts to do something very absurd, our crotchety and headstrong First Commissioner of Public Works has at length been forced into a sensible line of action; but, even with his head put straight to it, and with every detail clearly defined, he still wishes—as we shall presently show—to swerve crookedly in pursuing it. The deep trench and the close sewer are both abandoned. The necessity of a new bridge over the Serpentine, or of a tunnel beneath it, are given up. The common folk, in hired vehicles, are to cross the park in the broad light of day, and in full view of the tenderly-caared-for equestrians. A portion of their exercising ground is, moreover, to be appropriated to a more extended public use. For this inch of sacrifice an ell of compensation will, doubtless, be sought hereafter in Kensington-gardens; but we must not look a gift horse too scrutinisingly in the mouth. We think ourselves only too lucky in that one, even if Sir R. Mayne's excellent suggestions are conceded to us. The plan now—finally, we hope—settled, is to enter Hyde-park from the Bayswater-road at the Victoria-gate, and to make use of the present roadway as far as the bridge. This, as our readers are aware, makes a sweep round the powder magazine. Now we should like to know why this out-of-the-way curl in the road could not be dispensed with, and the much shorter route behind the magazine be adopted? The road as it is, by its twistings and turnings, extends to nearly double the length of a direct road; the necessity for increasing it is not certainly perceptible to us.

The present railing, which divides the roads on the bridge, is to be removed some 8 feet, so as to increase the width for the expected traffic. This is judicious; but the granite piers at either end will be great obstructions, and will seriously impede the traffic. The contractions of the road which they occasion are, perhaps, unavoidable on the bridge, but they seem in Mr. Cowper's mind to establish precedents which he feels bound to follow.

On quitting the bridge the road again turns to the left. This road it is also proposed to widen some eight feet, but rather than fell one solitary tree, or go in a direct line, a contraction is marked out in the very centre of the road, reducing its width at this point to under 30 feet. A road of irregular width, with a large traffic, is, as every one knows, the most difficult to keep clear, and yet, with two unavoidable contractions on the bridge, Mr. Cowper must needs inflict a third upon us within fifty yards of it, and this without the slightest necessity. There is no need to bend at all to the left on quitting the bridge; by slicing a few yards from a useless angle of Kensington-gardens, and filling up the ditch which now runs from the bridge to the corner of Rotten-row, and which separates it from Hyde-park, with the superabundant gravel ready to hand upon the ground, a broad footpath might be obtained and the present one added to the roadway. Two birds might thus have been killed with one stone; but Mr. Cowper will always use two stones to one bird. We may be told that a railing would then be required on the dwarf wall which bounds the property. We grant that, but in doing so we must add that the enclosure would then be effectual, which the present miserable contrivance is not, and that money would readily be granted for a manifest improvement. The road, after joining Rotten-row, does not cross it direct to the Exhibition, but continues in a westerly direction, so as to enter the Kensington-road opposite Prince Albert's-road, at the far end of the Exhibition building. This, at first sight, appears an unnecessary elongation of the road; but it should be remembered that the eastern entrance of the huge building will be of necessity the most crowded, and that any risk of a "block" at the junction with the Kensington-road is above all things to be avoided. An extended road of some 350 yards is more than compensated for by greater facility in reaching the building, and by decreasing the pressure in the most threatened portion.

The debate in the House of Commons, when Mr. Cowper asked for a vote of £2,000 to make this temporary road, proved clearly that in a multitude of counsels there is not always wisdom. "Every one," as Lord H. Lennox remarked—and he himself was no exception to the rule—"consulted his own convenience when some self-denial and forbearance might have been expected." Cavalry was pitted against infantry. Carriages, in Mr. B. Cochrane's opinion, ought not to encroach upon the equestrian's domain, either on the bridge, or, still greater sacrilege, in Rotten-row. He would batter at the children's peace by sending the vehicles through Kensington-gardens.

Perhaps, like Malcolm, "he has no children," and, therefore, "can dispute it like a man," but his opposition would almost lead one to believe that he had a large pecuniary interest in hired saddle-horses. Fortunately, although he "would still be talking, nobody marked him." Sir Morton Peto suggested a timber footway outside the present bridge, but his mention of Captain Fowke, and of his "signal success at the Exhibition," raised a laugh which puffed out the worthy Baronet's kindling idea; and Lord Elcho subsequently put an extinguisher upon it, amidst the cheers of the House. This little incident was worth the whole debate. Mr. Cowper's adopted plan—it is really a slight modification of Sir Morton Peto's—was, however, too simple and too easy of accomplishment for a sustained opposition, and the £2,000 were granted, but only after as great a discussion as that which was given to a vote of £14,000,000 a few nights previously.

We are not so sanguine as to imagine that the two practical amendments to the plan which we offer will be carried out, although no person who examines the site can fail to perceive their value; but, with them or without them, the new road will be a great boon, not only to the adjoining parishes, nor even to Mr. Cowper's expected Australian, but to the public at large, who, without it, would have been jostled and crowded in narrow streets by people who had no topographical reason for being near them.

PRE-RAFFAELLITE PICTURES.

MESSRS. Christie and Manson have within these few days, sold the largest collection of modern pre-Raffaellite pictures which has yet come to the "hammer." They were the property of the late Mr. Plint, a stockbroker, at Leeds, and cost him about £25,000. The varied style of art purchased by him—for although he possessed more pre-Raffaellite pictures than perhaps any other collector, among his water-colour drawing and oil pictures were found works of great merit by living artists—leads to the conclusion that he had been persuaded to lay out large sums in that peculiar method of painting, in the hope that it would become in the course of time a valuable property. The sale, however, to which we are now directing attention, has to a certain extent dispelled that illusion. An experience, if no benefit to him in his grave, may, we hope, prove beneficial to others who entertain the same belief in pre-Raffaellism. The value of that hope will be found in the three following instances: "The Carpenter's Shop," by Millais, which, we believe, cost him upwards of £1,000, was sold to a dealer for 500 guineas; "Christ Washing Peter's Feet," by Madox Brown, which also cost him a large sum of money, was knocked down for 90 guineas; and the last picture in the sale by the Belgian pre-Raffaellite, Henri Leys, for which he paid £15,000, brought no more than 800 guineas. That very profane picture, called as profanely the "Carpenter's Shop," being the boyhood of Christ, has already gone back to nearly its first price, viz., £500. As more than £8,500 has been lost on the sale of this collection, it may be assumed although most of the other pictures by the Millais-Hurst-Brown school brought monstrous prices, that the loss upon them was proportionately large, especially as the pictures painted by legitimate artists obtained excellent amounts.

The downward tendency of pre-Raffaellism, of which we have so constantly warned our readers, has set in earlier and more decidedly than was to be expected. Indeed, it is scarcely possible to calculate how far it has already gone, because the result of Mr. Plint's sale, marked as it is, gave but a very feeble and uncertain idea as to the real state of the market for such commodities. At the commencement of the picture season it is usual with the trade, if no good genuine collection is to be sold by auction, to get up a sale of their own, at which the purchases are of the most friendly kind, the object being merely to establish prices for the rest of the London season. If this proceeding is necessary with regard to the ordinary productions of art, how essential it must be with works of so doubtful a permanency, and for which there are comparatively so few buyers, as the paintings by pre-Raffaellites. Thus, had not the dealers in them bid liberally at the sale, the whole concern would have "caved in," and not only would have immediate selling been stopped, but future operations would have become hopeless. Under these circumstances it may, we think, be fairly argued the £8,500 lost upon this sale does not represent with accuracy the real deterioration in pre-Raffaellite pictures. Besides the causes given above for the delusion being kept alive as long as possible, it has another source of vitality through having become a party question, but unlike Swift's saying that "party is the madness of many for the gain of a few," it is the madness of a few for the gain only of a few, for there are dealers who won't "keep the article," and if we may judge from the audible remarks and laughable jokes passed in the room during the sale, a very few of the lunatics could have been present—we except, of course, those who have "method in their madness"—the sellers and the makers of the peculiar merchandise.

But out of this madness let us endeavour to extract something useful and remarkable. With respect to the latter we wish to direct attention to the want of consistency or style in the works of the leading pre-Raffaellite painters. Take the drawings by Millais to the "Framley Parsonage," "The Carpenter's Shop," and the "Black Brunswicker"—all three as different in treatment as it is possible to conceive. Take "Christ Washing Peter's Feet," "Our Lady of Good Children," and the "Last of England," by Madox Brown. Again, take "The Return from Marston Moor," "Gondomar witnessing the Execution of Raleigh," and "Elaine," by Henry Wallis. Each of these painters has produced results among these pictures belonging to epochs of art from the Mediæval period to the present day, and we are asked to believe that they are eminently sincere, earnest, and honest painters. Madox Brown painted his most Mediæval pictures last year, and the other the year before; but his picture most modern in style was painted in 1852, a period of ten years before the others. The most Mediæval picture, the "Return from Marston Moor," by Wallis, was exhibited two years ago. As to Millais, it must, however, be admitted that the most affected of his pictures in the sale was painted in 1852, but the tone and finish he displayed at that time are both lost in his more recent work, the "Black Brunswicker." There is another remarkable fact worthy of notice, which is that pre-Raffaellite pictures do not improve in tone with age. The yellowish red satin of the lady's skirt in the "Proscribed Royalist" is as much like copper as it ever was, and the white satin dress of the lady in "The Black Brunswicker" is, if possible, more like tin than when it was first exhibited. In conclusion, we think the following hint may prove useful to young painters. It was decidedly proved at the sale, that whether a picture was painted by a pre-Raffaellite or not, brilliant effects of light and vivid colouring, subjects of human sympathy and strongly-marked expression, obtained the most attention and brought the largest sums of money, particularly if distinguished by a quaint and catching title. The fact being so, there is not the slightest excuse for attempting old-fashioned quaintness or absurd antics in art. A good subject, well and legitimately painted, will certainly meet with a liberal reward.

A LATE COMBATANT.

IF it were possible for any one to slumber uninterruptedly for a twelve-month, we should think that such a calamity had befallen a gentleman who in the current number of the *Art Journal* signs himself "an Architect." He seems suddenly to have awaked to a sense of the utter ugliness of the new Exhibition, and, like a boa, he attacks his prey with a voracious appetite, even before he has had time to inquire whether it be worth a display of his energies, and whether it has not already been done to death. We do not notice "an Architect" with a view of defending the Exhibition; but he takes upon himself to censure the lions of the profession for omitting previously to demolish so outrageous a defiance of their taste. He complains that the architects—by which we suppose he means the heads of the professional societies—said nothing, and that the *Builder* and *Building News* also said nothing, although the most inexperienced in art regarded the building with suspicious misgivings. We would here recommend "an Architect" to turn over the last volume of our Journal; he will there find that not only did Mr. Tite, in the name of the Institute, deem it his duty to "protest against the official exclusion of architects from the councils of those who assume to represent the taste of the nation in the various branches of art," but he anticipated (see page 871) the cheers with which "vulgar unreasoning abuse of our profession" was received at the Society of Arts, and which seems, from "an Architect's" letter, to be the spur which has occasioned his spasmodic action.

Mr. Blomfield, also, in his inaugural address at the Architectural Association, spoke of the "monster which is now developing its vast anatomy at Brompton," and which "was hatched without the decency of even a nominal architectural incubation." Moreover, we have ourselves in special reports never failed to point out the defects of the building—the long line of dullness in the Cromwell-road, the mistake of believing bigness and grandeur to be synonymous terms, the want of harmony between the forms of the nave and the courts' roofs, all of which "an Architect" fancies he has newly discovered. We have praised the lighting of the picture gallery whilst condemning its decoration, and have protested against filling the senseless blank arcades with mosaics, or spending a penny in the vain attempt to render the building passable. We have done even more than this—more even than "an Architect" does now even in two pages of piled-up censure—we have shown that Mr. Meeson has been entrusted with the task of preparing all the detailed working drawings, so that even the merit of construction is not even due to the military engineer, and that Mr. Sykes and his pupils have designed what few decorative features are seen in the building. We have certainly applauded the untiring exertion of the contractors, and have not even refused simply because Captain Fowke was not "a regularly educated architect," to give him praise where we believed he fairly earned it. Nearly every newspaper has lamented the want of taste flauntingly displayed at Brompton. Mr. Cole, in his handbook, is its only avowed champion; he loves it with the affection of a maiden aunt, and the *Times*—for reasons which could be easily explained—is but a windy expansion of Mr. Cole.

We are at a loss to see the object of "an Architect's" letter. In one part he fears that "foreign visitors will look upon the building as the best thing that we could accomplish, when we set the full architectural power of the nation at work," whilst at the end of his communication he says, that the building by its ugliness "acquits the profession, that foreigners well know we have amongst us architects of the very highest ability." It is certainly too late to prevent the building answering the purpose for which it was built; when there was a chance of the "job" being frustrated, we did our best to defeat it; now that the building is an accomplished fact, it is idle to be for ever harping upon the same string. If we have an ugly house and are obliged to live in it, let us smother our ill temper and show our own taste by furnishing it artistically and creditably, and be determined to withhold even a shilling towards covering with mosaics that deformity which ought never to have afflicted the eyes of friendly neighbours; one might as well set diamonds in the trunk of a tree as put Lucca della Robbia work on the Cromwell-road front. It is of no use wailing over that which cannot be remedied; let us rather look ahead and guard against any similar surprises. We have yet to learn the real object of the picture gallery having been made a permanent building; to prevent South Kensington from being for ever a hot-bed of amateurs who believe they know everything because they have learnt nothing, and to make it what it was intended to be, a School of Art and Science.

The fault which "an Architect" finds with the building are most of them true enough, but we think if he had devoted the time given to his long article to a careful perusal of the *Building News*, he would not only have seen the utter inutility of publishing it, but, at the same time, had reason to get rid of his complaint against the architects and ourselves. But if our surprise is great that "an Architect" should have supposed us guilty of indifference in the matter, it is still more so that our contemporary the *Critic*, should endorse that portion especially of his communication. It ought to know that the press, with one exception only, has repudiated the Exhibition building as an exponent of English architecture, as well as it knows that that repudiation is deserved. It is rather too bad after doing a soldier's duty to be told by the latest reinforcement that one has been all day carousing in the enemy's camp. When another fight has to be fought, although it be a losing one, we hope to find "an Architect" and the *Critic* by our side at the commencement of the fray.

ST. STEPHEN'S CHURCH, SPITALFIELDS.

THIS church is a plain, but substantial structure, designed to fit a site of very peculiar shape. It is consequently somewhat unusual in its external form, but so arranged as to occupy and make available for accommodation every foot of ground upon which it stands. Its most striking peculiarity is the western apse, which, though not unprecedented, being by no means an uncommon feature in German churches, has not hitherto been much used in this country. It is in this case the natural termination of a nave, the centre line of which strikes upon the angle formed by two streets, and it is by the adoption of this form that every part of the site has been rendered so entirely available.

The church was originally designed with two towers, terminating in spires, but the most stringent economy having to be practised in every part, they were necessarily omitted.

Exclusive of the apse and chancel and its aisles, the form of the church within is an exact square, of 61 feet 6 inches, divided into nave and aisles by arcades, supported by four pillars only, two on either side.

The nave is 28 feet wide; the north aisle, 15 feet 8 inches; the south, 12 feet 4 inches. The chancel is 28 feet by 19 feet, and the depth of the apse, 31 feet. On either side of the chancel are aisles continuous therewith, exclusively occupied by children's seats. The height of the nave to the square is 27 feet, and to the ridge 49 feet, being 15 feet less than was originally intended.

The aisles are divided externally into three bays, each surmounted by a gable, for the purpose of admitting large three-light windows, on which the illumination of the interior chiefly depends. The apse has two stories of windows—one below the gallery, stepped up in gradation to its rise, and the other of narrow openings above the backs of the seats. The eastern end of the site being to be blocked by houses, a window in the gable only was practicable, and the chancel is lighted by side windows over the roofs of the children's aisles.

The walls of the church are built and faced with plain stock bricks, intermixed externally with red and black bricks; and the arches and piers internally are faced with red and white bricks.

The church is fitted with stained deal internally.

Every part of the building is finished very plainly, the capitals of the pillars, corbels, &c. being the only parts in which carving is introduced.

The cost of the building has been as follows, the amount having been considerably increased by the great rise in the price of bricks, which occurred before the contract was taken:—

Builders' contract and additional works, including carving, and £558 for extra foundations.....	£6,013
Heating apparatus and flues, by Haden, of Trowbridge....	189
Gasfittings by Skidmore.....	126
Bell and fittings.....	26
Fittings and furniture.....	29

Total£6,383

The architect was Mr. Christian; the contractors, Messrs. Browne and Robinson; clerk of works, Mr. J. O. Abbott. The foundation-stone was laid in October, 1860, and the church was consecrated on December 6th, 1861. The church answers admirably acoustically, seats in the extreme end of the apse being equally good for hearing as those in the body of the nave, and, owing to the width of the nave, and large span of the arches, there is not a seat in the church which does not come within view of the preacher.

PROFESSOR BARLOW, F.R.S.

WE have to record the death of Professor Barlow, the author of the "Strength of Materials" and many other works. He was born in Norwich in 1776. In 1806 he was appointed one of the mathematical professors at the Royal Military Academy at Woolwich, which office he held until 1847. His discovery of the means of correcting the local attraction on the compasses of ships brought him into great notoriety, and he received the Copley medal, and was elected on the Council of the Royal Society. The Board of Longitude conferred upon him the reward provided for useful nautical discoveries. The Emperor of Russia acknowledged the value of the invention, and presented him with the diploma of the Imperial Academy of Sciences at St. Petersburg, and he was elected a corresponding member of the Institute of France and the Royal Society of Brussels, besides other rewards and honours. He was associated with Mr. Telford in experiments for the Menai-bridge. He was then consulted in reference to the removal of Old London-bridge. In 1836 he was appointed one of the Irish Railway Commissioners, with General Sir John Burgoyne and the late Mr. Drummond, and subsequently appointed on three other royal commissions relating to railways in England. In 1847 he retired from the Royal Military Academy, and the Government awarded him his full income for the remainder of his life, in consideration of his eminent services. His simple and upright character, and his kind and cheerful disposition, endeared him to a large circle of friends. He died on the 1st of March.

THE NEW COPYRIGHT BILL.—The proposed Bill for amending the law relating to copyright in works of the fine arts, and for repressing the commission of fraud in the production and sale of such works, provides that the author of every painting, drawing and photograph which shall be made, or for the first time sold or disposed of, either in the British dominions or elsewhere, after the commencement of this Act, and his assigns, shall have the sole and exclusive right of copying, reproducing, and multiplying such painting, drawing or photograph, and the design thereof, by any means and of any size, for the term of the natural life of such author, and seven years after his death: provided, that when any painting or drawing shall be for the first time sold or disposed of after the passing of this Act, the person so selling or disposing of the same shall not retain the copyright thereof unless it be expressly reserved to him by agreement in writing, signed at or before the time of such sale or disposition, by the vendee or assignee of such painting or drawing.

THE ALBERT MEMORIAL.

ON Friday last the Committee of Advice nominated by the Queen to assist her Majesty in the choice and mode of execution of a design for the proposed national memorial, held a meeting in the Council-room of the Fine Arts Commission at the Palace of Westminster.

The brief notice of their preliminary meeting, which appeared in the BUILDING NEWS, has resulted in a number of communications being addressed to the Committee by the owners and lessees of granite quarries in various parts of the country, relative to their respective capacities to yield a monolith of adequate grandeur for the proposed memorial. A perusal of these tends to dispel the notion, which had been previously entertained in some quarters, that the search for a single stone of the requisite dimensions in this country would be attended with incalculable difficulty. The Ross of Mull Granite Company state that they can supply a monolith of red granite larger than any known column in existence. The obelisk in front of the Winter Palace at St. Petersburg, they say, is the largest one in Europe, measuring 93 feet. They state that they can exceed that by at least 7 feet in length, and with a corresponding excess in diameter. This stone, said to have been hitherto unnoticed, is reported by their manager, Mr. Marshall, to have been discovered in the Tormore locality, and, what is still more remarkable, to be already quarried on three sides. It is described, moreover, as lying just at the surface of the ground, with a fine open field in front on which it could be rolled out and "scabbled." It has an even surface, is quite detached at top and bottom, is perfectly sound, and of a good red colour. It is upwards of 100 feet in length, and will average about 12 feet in diameter. Besides this letter, there is also one to the effect that in the granitic formation between Penryn and Helston monoliths can be shown at this moment of several thousand cubic feet, perfectly sound, and without a single defect. These are but two examples among many others of the information which has been elicited on the subject.

The Committee was chiefly occupied on Friday in the consideration of the enormous difficulties with which the operations, first of quarrying a monolith of the desired dimensions, then of transporting it to its ultimate destination, and finally of rearing it, would be attended. Assuming, for which there is reason, such a stone at a rough calculation to weigh some 600 tons, a ton being a horse load, a faint idea may be formed of the prodigious labour and risk of conveying it to the metropolis by sea, and still greater by land. Again, suppose it to have been brought up the Thames as far as Chelsea, the question of moving it through, in some cases, narrow and tortuous streets would require a practical solution. These, of course, are considerations for the exercise of engineering skill, and are only now alluded to as confronting the proposed undertaking from the commencement.

Among others, Sir Roderick Murchison is rendering the Committee valuable assistance as to the various quarters where a monolith of the requisite proportions might possibly be found. The Duke of Argyll, who has granite quarries on his estates unleased, is understood to have made a generous proposal in the event of their capacity being proved to yield a stone suitable for the proposed national monument.

THE THAMES EMBANKMENT.

A NUMEROUSLY signed memorial and protest of owners and occupiers of wharves and other property on the Surrey side of the Thames has been presented to the Commissioners, setting forth that, between Lambeth Palace and Southwark-bridge, there are eighty wharves, in separate occupations, carrying on a variety of extensive trades, besides factories, mills, granaries, and buildings rising directly from the waterside, with drawing docks and free landing-places, and for all of which the free use of the river shore is essential. While expressing their unwillingness to offer any opposition to public improvements and relieving the evils arising from the floodings of the river, the memorialists consider that their entire trades would be seriously damaged if any material impediment should be created in the river traffic by the interruption of the landing and loading of goods. They consider that any of the plans for an embanked roadway that have been laid before the public would materially impede such traffic, and that the present flooding of the river periodically may be prevented by causing the banks of the river to be raised and the wharf walls to be altered.

CHURCH BUILDING.

Oxford.—Dunster Church.—This parish church has been restored, the whole expense—£2,000—having been borne by Sir H. W. Dashwood. The church is in the early English style, and nearly the whole of the body and chancel have been rebuilt. The arcade has been restored, retaining the old pillars; a portion of the old screen, separating the chancel from the chantry, has also been retained. The roof and seats are new. The singing gallery, formerly under the west entrance, has been pulled down, and a space of about five feet additional width has been obtained at the north side of the church. The pulpit, altar rails, &c., are new. An old piscina at the east end, formerly imbedded in the wall, has been brought to light. Two of the windows are entirely new, and others have been restored, Messrs. Clayton and Bell supplying the stained glass. At the entrance to the chancel on either side are busts of her Majesty and the Bishop.

Manchester.—New Church at Patricroft.—On last Saturday the foundation-stone of an iron church was laid in the centre of Patricroft. The intended building will be 95 feet long, 50 feet wide, and 38 feet high. Its estimated cost amounts to £1,600, and 800 adults and 200 children will be provided with accommodation. The building is being carried out by Messrs. H. C. Hemming and Co., iron church manufacturers, the clerk of the works being Mr. Bryant, of that firm. The style is to be Gothic, and the building will comprise two aisles, nave, chancel, organ chamber, and gallery for children. The walls and roof are to be of corrugated and galvanised iron. The inside of the building will be cased with wood, canvassed and papered. The space between will be left unfilled, for the purposes of ventilation, &c. The benches are to be of fir, stained and varnished. There will be an octagon pulpit of the same material, and a reading-desk to correspond. The entrances will be at the west end. A bell-turret will surmount the western gable.

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post.* Gold watches, 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enables persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.
J. W. BENSON, 33 and 34, Ludgate-hill, 45 and 47, Cornhill, London, E.C. Established 1749.

OBELISKS.*

WE continue our account of the principal obelisks in the world. Two obelisks of red granite, without inscriptions, 47 and 48 feet high respectively, formerly stood at the entrance of the mausoleum of Augustus. They were brought to Rome by Claudius in the fiftieth year of the Christian era. Sixtus V., with the aid of Fontana, placed the larger one before the Church of Santa Maria Maggiore. The other, two hundred years later, was erected by Pius VI. in front of the Papal palace on the Quirinal. The base of this latter is more ornamented than any of the others, and may give our artists an idea of the effect of large blocks of sculpture at the foot of an obelisk. The famous colossal equestrian groups style, Castor and Pollux, which give the name of Monte Cavallo to the square in which they stand, are on either side of the base of the obelisk; but we are afraid that the spectator thinks little of the obelisk as he looks upon the brilliant action which the Greek sculptors have infused into their groups. There is a want of harmony in the different features of the whole group, and it could scarcely well be otherwise when we remember that one portion was fashioned and rounded by the most artistic nation of ancient and modern times, that the other was simply squared, hundreds of years before, upon another continent, and that there was nothing but the Roman art of the last century to bind them together.

The obelisk in the centre of the Piazza Navona, is, perhaps, the most picturesquely treated in all Rome. Little is known with certainty of this obelisk; it is even doubted whether it be an Egyptian work. It is of red granite, and was found, broken into four or five pieces, in the Circus of Romulus, near the Appian Way. Its height is 54 feet 3 inches, but, with its base, it is within a foot of 100 feet. It was erected 200 years ago by Innocent X. It—or rather the pedestal which bears it—stands upon a huge mass of rockwork, 31 feet high, in the centre of a fountain. The rock has an opening through it, and statues by Bernini are perched upon it. The water which supplies the fountain issues from the rock. The pedestal is somewhat wider than the obelisk, and has a small cornice on the top; a broad belt of masonry projects 2 or 3 inches from the die of the pedestal. The obelisk itself is capped by metal-work. The pyramidal substructure of this obelisk, notwithstanding the coarse treatment of the sculpture, gives the whole group a gorgeous effect. The squared obelisk and the smoothed sculpture are linked together by the rough rockwork, and the contrast of light upon the uneven surface of the stone upon the sparkling water, and the rounded marble figures, make us almost forget that Bernini had anything to do with the work.

A pair of obelisks, 17 feet high, were, in 1665, found in the gardens of the Dominican Convent, behind the Church of St. Maria sopra Minerva. These are supposed to have formerly stood at the entrance of the temple of Isis and Serapis, in the Campus Martius. Bernini, with his usual want of taste, placed one of them on the back of a marble elephant sculptured by Ercole Ferrata. It stands now, a sad spectacle, in the centre of the piazza before the church above mentioned.

Clement XI., forty-five years later, placed the companion obelisk as a central feature in the middle of the fountain, which stands before the Pantheon.

The obelisk which formerly stood in the Circus of Sallust now crowns the lofty summit of the Pincian Hill, in front of the Church of the Sta. Trinità dei Monti. Including its base and ornaments it is 99 feet 11 inches high, but it may almost be said to have the whole flight of steps which lead from the Piazza di Spagna for its substructure.

A small obelisk, 30 feet high, was, by Pius VII., reared also on the Pincian Hill. It is covered with hieroglyphics, and was found near the Church of Sta. Croce, in Gerusalemme.

The obelisk of red granite erected by Antinori on Monte Citorio was the one which so charmed Winkelfried by the beauty of its hieroglyphics. It was brought from Egypt by Augustus, and stood formerly to serve as a meridian in the Campus Martius. Its height is 71 feet 6 inches. It is surmounted by a bronze globe. Its base was formed of fragments of the Aurelian column, which were discovered near it.

There is another small obelisk in the gardens of the Villa Mattei, on the Celian Hill, but it is an insignificant specimen in a city so rich in obelisks as Rome.

There are one or two obelisks, we believe, in the Egyptian Museum at Florence, but they are of small proportions.

The magnificent obelisk which, at a cost of £80,000, Louis Philippe transported from the Temple at Luxor is well known to all visitors to Paris. It stands in the centre of the Place de la Concorde. It was brought to France by M. Lebas, the engineer, and by him fixed in its present position. A detailed account of every circumstance connected with its removal has been published, under the title of "Notice Historique, Descriptive et Archeologique sur l'Obelisque de Luxor." From it we learn that, on its being taken down, a fissure was discovered, extending up it, which, from the fact of its being secured by wooden dovetailed cramps, was evidently an original flaw in the Syene granite. The name of Rameses II., better known as the Great Sesostrius, was also found beneath it. The two monoliths were both given by Mohammed Ali to the French Government, but it was, seemingly, content with the expense and luxury of one of them. Its height is 72 feet 3 inches, and its greatest width 7 feet 6 inches, thus being rather less than the general proportion of ten diameters. A pedestal was made for it, of a single block of grey granite, from the quarries of Laber, in Brittany, which weighed 240,000 pounds, nearly half the weight of the obelisk. The obelisk is covered with splendidly cut hieroglyphics. The eastern side bears a Latin inscription, recording its removal; the western side, one in French, of the same purport; on the northern side are engraved gilt sections of the machinery used in Egypt for the removal of the obelisk; on the southern those employed in Paris. A model of the machinery was deposited in the Conservatoire des Arts et Métiers.

There is another obelisk in France, at Arles, erected in 1676, in the square next the town hall. It was found prostrate in the mud of the Rhone. It is a simple shaft of grey granite, and was for a long time considered to be Egyptian, but it is now believed to have been taken from a quarry in the Estrelle Mountains, near Fréjus. When discovered it was broken at the top, but the missing fragment was found, and is now re-attached to it. It is 55 feet high and 7 feet 6 inches square, and it tapers considerably more than any found in Egypt. It rests on four lions couchants, which are at the angles on the cornice of the pedestal. A broad landing bears the whole mass. The sides of the pedestal are inscribed with panegyrics on Louis XIV., in whose reign it was re-erected. The top is decorated in a hideous fashion, with a globe and fleur-de-lis surmounted by a gilt sun, which has eyes, nose, and mouth marked upon it.

In England we have four genuine Egyptian obelisks. The largest, 22 feet high, is that to which we have already alluded, which stands at the seat of Mr. Banks, in Dorsetshire. It was procured by Belzoni from the island of Philæ, and bears some very interesting inscriptions. Another is at Alnwick. The two remaining ones stand on either side of the Egyptian gallery in the British Museum. They are of basalt, and covered with the most exquisite hieroglyphics. The faces and figures are chiselled with rare delicacy. The outlines only are sunk at right angles about half an inch, the sculpture itself is rounded slightly, so that the most projecting portion is on the same surface as the main surface of the obelisk. These obelisks are about 9 feet high, and 1 foot 6 inches in diameter. They were captured by the British Army in 1801, and presented by the King to the National collection.

In an adjoining gallery we can see two obelisks from Assyria. The black one is the most important. It contains five panels of sculpture on each side, and the bands which divide, and the space below them, are covered with 1,500 lines of Cuneiform inscriptions, detailing a history for thirty-one years of the empire. Grotefend fixes the date of this monument at twelve or thirteen centuries before Christ. Hincks reads upon it the name of Jehu, son of Khumri, who is identified with Jehu, King of Israel. This would make it one hundred years earlier; but there can be little question, from the style of the bas-relief upon it, that it is coeval with the earliest records of the Assyrian empire. It is between 6 and 7 feet in height. A larger one near it has its sculpture more defaced, and its inscriptions are illegible. It is cut from the ordinary limestone of the country. The peculiarity of both these monuments is not only in their sculpture, but in the termination of their apices. Whilst, in Egyptian examples, the tops are finished off in the form of a pyramid, these Assyrian ones are terminated by three steps or gradines, and are flat at the top.

Another peculiar obelisk—a polygonal one—said to be Egyptian, stands before the cathedral at Catania in Sicily. It is fixed on the back of a carved elephant. In the Monumenta Danica we see an engraving of an obelisk, with a cross carved upon it, and we learn that similar ones have been found in several parts of Scandinavia. Of course they have nothing to do, except in their similarity of form, with the obelisks of Egypt. We cannot conclude this notice without mentioning that Mr. Bell, the sculptor, who has devoted much study to the subject, has adapted an entasis both to the horizontal and vertical surface of the obelisk. As a practical illustration of his theory he has designed a memorial obelisk of the 1851 Exhibition, which will be amongst the great works which are to gladden our eyes at this year's gathering. We have not yet seen Mr. Bell's work, so can say nothing of the result of his improvement, or whether even it be an improvement. He laid his ideas very fully before a meeting of the Society of Arts two and a half years ago, and his lecture has stimulated the curiosity of many people to see the work which his reflections have given birth to. The interest taken in the subject is shown by the fact that the report of the lecture in the Society's Transactions is out of print. The resolution formed by her Majesty to have an obelisk reared to the memory of the Prince Consort will increase this interest, which we can but hope will culminate in English talent hewing from British granite a nobler obelisk than any which Syene yielded to bear the records of ancient magnificence, and then to become either melancholy wrecks upon the Egyptian soil, or to be dragged thence in triumphal procession behind the victorious Cæsars.

INSURING THE EXHIBITION BUILDING.—The information which first obtained circulation as to the terms on which the building for the International Exhibition has been insured with the Norwich Union Fire Office was not quite correct in all its details; but the following particulars, which are derived from an official source, may be relied on. Soon after the contractors, Messrs. Lucas Brothers and Mr. Kelk, commenced operations, they took out a policy in the Norwich Union for £40,000, the provisional insurance being increased every month until the total stood at £175,000. On the structure being handed over to the Royal Commissioners, they opened negotiations with the Norwich Union, and the result was that it was agreed to insure the building for a year for £450,000, at 10s. 6d. per cent. premium, subject to the conditions of average. This rate of premium involved the payment of £2,362 10s., to which must be added the duty (3s. per cent.), £675, making the total sum paid to the office £3,037 10s. The Norwich Union has since transferred a portion of its weighty responsibilities to the Phoenix, Guardian, Atlas, Imperial, and Globe offices. —Civil Service Gazette.

SURFACE DECORATION.*

THE numerous objects that influence the distribution of colour in the different apartments of a building are not always under the control of the architect, particularly the movable fittings and furniture, which are generally disposed by the lady superintendent and her upholsterer, and do not always improve the effects that have caused the architect much study and anxiety to produce, but, on the contrary, frequently destroy all concord with the worst possible taste. Furniture and furnishing should be as much under the control of the architect as the other decorations of the apartment or building, and when an architect of taste is employed, I am sure the result cannot fail to produce more harmony than is generally met with in our interiors. The decoration of a wall, floor, or other subordinate part of a building, if designed on good principles, should bear the same relation to the leading objects of the room that a background does to a painting, yet not rendering it so tame and suppressed as not to attract any attention, but help to enrich the general effect without depriving the principal objects of their legitimate attention. By a due adaptation of colour and form many difficulties in design may be considerably lessened, and faults in arrangement have not unfrequently been converted by judicious treatment of surface decoration into positive beauties. Light, above all things, should be well considered. It rarely happens that an apartment is too light, but if such ever should happen to be the case, a remedy is readily found in the application of colour. This will prescribe at once the use of dark colours, because they absorb the light; red and violet surface en masse are not at all favourable to the complexion; light blue is less favourable than green. The colour of paperhangings recommended by Chevreul as producing good and appropriate results are those which present designs of a light tone, either normal or coloured grey; upon a white ground, or the reverse, and in which the pattern is at least equal in extent of surface to the ground, for a small pattern has a very poor effect in large rooms. Patterns of two or more tones of the same colour, or those that produce little contrast, are preferable to attractive and glaring designs, which destroy the repose a wall should exhibit. Hangings are made to have very chaste and excellent effects with appropriate borders. We should first consider which harmony we wish to produce—the harmony of analogy or the harmony of contrast. The harmony of contrast is very suitable to surfaces of a uniform pure tint; for instance, a pale yellow ground with a monochrome ornament may be well relieved by purple and white in small quantities, with a little blue, for white surfaces with pale grey ornament, or vice versa, are contrasted well with gold; orange, or yellow, may also be in tones with a very pure effect. The most forcible example of the harmony of analogy I can introduce would be yellow surfaces, with a border of orange, gold, or brass ornaments. The wall-covering or skirting plays an important part in apartments, where it is made high to resist the blows of chairs, &c., &c., and should be of a dark rather than of a light character, and harmonising with the carpet, which produces the best effects in dark colours. Ceilings, as a general rule, should be white, or of the palest tones of colour; and the cornice divided from it by a darker tone, particularly avoiding white parts, which would be confounded with the ceiling. The ceiling should be always separated from the walls by a darker or contrasting tint, and may be further picked out with darker tones, or relieved with gold. The doors, windows, and other furnishings of an apartment are invariably painted or stained, as the case may be, of one colour. I think these may be varied with advantage: for instance, the door performs a different office from the skirting, and should be distinguished from it by a difference of colour, while the other parts may be separated by variety in the tones. The general colour of doors may be grey, tinged with the colour of the walls; the door frame or architrave should be darker than the door. In the foregoing I have considered the uses of colour as applied to the surface, and completely concealing the materials. With some, particularly of late, the feeling is for an inconsiderate demolition of what are erroneously called shams. My space will not allow me to offer you but a limited defence for applied surface decoration; doubtless three or four coats of oil and a few yards of paper will cover a multitude of sins that would be unbearable exposed to view. I cannot bring myself to think (much as I have tried, and with due regard for the exposure of the true material) that the appearance of a stained deal door, in some positions, is preferable to a painted one, any more than I could admit that a grained deal door in imitation of oak is superior to a solid oak one. When the funds will only admit of deal as a finishing, which is mostly the case, the colour may be otherwise consistently applied without imitating any superior material, by plain tinting alone, which appears to me far more pleasing to the eye than many of the dirty stains and treacley surfaces invariably left by the stainer and varnisher. Moreover, it is not so easily renovated and cleansed, for when it is darkened by time, or dirtied and unsightly by wear, I do not see how it can be made to take its place again with the other decorations of an apartment. With regard to walls, I think stucco as applied to the interior of secular buildings can never be abolished; neither does it appear to me a sham unless a superior material is represented on it; there is nothing that offers such a ready means of giving a flat surface to receive the charming effects of colour. The question resolves itself into this, if we discontinue its use, what can we replace it with that shall be as economical and answer the purpose so well?

The advocates for "truthful building" have condemned, unmercifully, I think, the use of stuccoes and cements. There, doubtless, are many excellent arguments against their use, and for exterior purposes few will feel inclined to add to the mass of shattered incongruities that deface our principal thoroughfares; but with interiors it will be found more difficult to practise the precepts urged. One or two noble exceptions of late, however, have done much to show the practicability of the reasoning. Neither of these, though, it seems to me, have grappled with the real difficulty. What substitute can we produce for the plastered interiors of our dwelling-houses and other assembly-rooms, which are certainly as much of a sham as the plastered walls of a church? How can we give the neatness, economy, and harmony with the surrounding walls, offered by a common plaster partition? A truthful wood panelling would certainly be a very discordant substitute, unless it were continued all round the walls, which would be exceedingly expensive, and it is very doubtful if the result would be as satisfactory. Again, there are many buildings where a positively showy and grand appearance is as essential to their success as the funds for their existence; and, lastly, its use is sanctioned in a degree by the best works of the best masters of all ages, and by them converted into a medium, wherein the noblest conceptions have been pictured and rendered for ages imperishable. Let us not abandon, then, what others have turned to such good results, but rather endeavour to appropriate with consistency what universal custom sanctions, and at which good taste will find nothing offensive.

The ingenious imitation of valuable materials is sometimes so complete, that it is almost impossible to escape being deceived. I have been assured that the best judges have been mistaken in detecting the scagliola imitations of the dark green marble pillars from the real marble in the old church of St. Miniato, at Florence. I mention this as an instance to what perfection this art has arrived; of course much depends on the skill of the artist. It will be hardly necessary to observe that the greatest discretion is required in applying imitations of any kind; it is so easy to make free use of them, their cost being comparatively little is a great inducement to frequent and indiscriminate application that may lead to unfavourable results, and bring into disrepute that which, used consistently, may be worked in with great advantage.

To Italy we must turn again for the origin of nearly all our plastic embellishments. The fresco and gesso painting, the imitations of marble or scagliola, graffiti work, and many other simple and elegant decorations, that must be valued for the mind they exhibit only, for the material is frequently next to valueless. Fresco and other plastic painting is scarcely within the province of the modern architect's education, but, from the great interest now so apparent for its revival, and the prominent effect it must have in a building, induces me to say a few words on the manipulation, upon a freshly plastered wall while the plaster is wet, is said to be in fresco, and known as *buon fresco*, or good fresco, in distinction to another process, known as *fresco secco*, or dry fresco. For *buon fresco*, a plaster formed of old and very carefully slaked lime and sand is roughly applied to the wall or other surface as a first coat, upon this another of a finer quality is laid; this prepares the surface for the *intonaco*, or *fresco ground*, which is of the purest lime and sand. The application of this last coat is as follows:—The surface prepared for the *intonaco* is wetted with water until it will absorb no more, a thin layer of the *intonaco* is then applied to as much of the wall as required for the day's work, and when sufficiently dry the outline is traced from the

full size cartoon, and the painting proceeded with in watery washes; the surface must always be moist, or the proper combination with the plaster will not be effected; the colours are mixed with distilled water, and are chiefly the earthy pigments, as vegetable and mineral colours are affected by the lime. Mr. Wilson, in his report to the Commissioners of the Fine Arts, gives the following mode of working the *fresco secco*, as practised at Munich:—"The plastering of the wall having been complete as for *buon fresco*, the whole is allowed to dry thoroughly. Before painting, the surface of the *intonaco* must be rubbed with pumice stone, and on the evening of the day before the painting is to be commenced it must be thoroughly washed with water mixed with a little lime, it must be wetted again the next morning, and it is then ready for tracing the outline and painting; the surface must be constantly moistened by means of a syringe. *Fresco secco* is a good method of decorative painting, for which it is now much employed.

The application of scagliola work is a comparatively modern introduction in England. I believe the Pantheon in Oxford-street is one of the first buildings in which it was used. Lanzi mentions it as invented by Guido Fasi, of Carpi, in the sixteenth century. The Florentines have carried this art to the greatest perfection, and had a public school in the Royal Academy of Florence, for teaching how to inlay and paint it, which is in reality *gesso* painting, or plaster painted with colours in water; it absorbs the colour to a sufficient depth to allow of the surface being polished without destroying its brilliancy, and some of the effects are charmingly brilliant and enduring. This beautiful embellishment is not confined to the imitations of marbles only; the readiness with which it is adapted to any form, and the enduring polish it takes, renders it susceptible of many useful and elegant appliances; to none is more commendation due than to the inlaid scagliola work, of which there are numerous valuable specimens in imitation of landscapes, figures, flowers, in the Florentine galleries and churches, and of which here is a very beautiful work intended for the International Exhibition by Mr. Georgi, who has devoted considerable time and attention to all kinds of plastic imitation which are peculiarly Florentine, and I hope he will meet with the success his talents and perseverance entitle him to; the artistic skill in mixing the plaster to the different natural tints, and the knowledge and power of drawing required to produce a successful result, without any application of paint, can be readily conceived. The base of this material is the purest sulphate of lime, prepared with great care. Keene's cement is largely used for this purpose, and mixed with the different colouring materials of the hue required; the art of mixing these so as to imitate the marble required is kept by the artists as secret as possible; the polishing is effected by friction with grit stones to a level surface, then with felt dipped in tripoli and oil, and lastly with oil alone; a lustre is obtained as durable as the most highly polished marble. Not only may the costliest and rarest stones be successfully imitated, but any combination of colours may be produced; for instance, purple with emerald green, siena veined with purple, or any other splendid caprice that fancy may dictate.

There is another kind of wall or surface decoration practiced in Rome, Florence, &c., since the sixteenth century, and known as *graffito* work. It is very simple and effective: two layers of plaster or cement about the eighth of an inch thick, of different colours, are applied to the surface to be decorated, the lower one serving as a ground, which we will suppose to be black, while the upper one is white and softer than the under one, which enables the artist with his graver to remove that portion of the upper surface his fancy may suggest, leaving the black ground exposed. Very beautiful scroll work in outline has been introduced in the panels of pilasters, spandrels of archways, and other details, it may be said to be to an extent imperishable, and equally applicable for exteriors as for interiors. Here are some specimens from which you may judge of the effect—some are in black and white, others show the application of two colours. It is not at all expensive; it may be executed for about one shilling a foot. Somewhat allied to this class of decoration is the very interesting process of engraving on white marble; its effect is particularly chaste and beautiful; its success, though, entirely depends upon the skill of the artist, as great care and experience is required to bring out the more delicate etchings and lines. The manipulation is this: the surface of the marble is covered with a composition not acted upon by the strong acids, the lines are then traced with a fine graver on this ground, leaving the surface bare; an acid is then floated over the surface which corrodes the marble exposed by the graver, the lines are then filled in with a black composition, the whole is cleaned off, and the delicate etchings of the graver exhibit on the marble a beautiful outline with all the fineness of a pen drawing. Here is a specimen. The compactness of a marble texture for producing fine lines, is of course superior to such as Caen or Bath stone; to show the applicability of this mode of decoration to common stone, I may instance the interior of the Church of St. James the Less, at Vauxhall. Here the principle is much the same, the only difference being the incisions at the church are made with a chisel instead of the acid, and, being in freestone, are necessarily much coarser. I have been informed that the white marble pavement of the room lately built in the Museum of Natural History, at Florence, to the memory of Galileo, is engraved after this manner, and represents a full length figure of him, and all his different inventions and discoveries, with very satisfactory results.

There is one more kind of plastic imitation of marbles extensively applied in Venice to floors, and known as Venetian pavement; it has also been used very much by the ancient Romans, and known by them as *opus incertum*. It allows of being treated with much fancy and ingenuity, and when good cement is used it is very durable. It is made of small pieces of marble (or imitation thereof), of different kinds and colours, as fancy may suggest, mixed like concrete with the cement, forming the imitation required; this is floated over a well-prepared concrete surface, and when dry it is ground and polished, forming a very beautiful and inexpensive flooring, of which here are some specimens. By giving variety to the colours endless design may be introduced, which may be carried farther by applying any kind of geometric pattern; it is one of the cheapest kind of pavings known.

Mosaic is a description of inlaid work, by which a design is produced on a surface by joining together small pieces of different coloured substances. This very ancient mode of ornamentation appears to have been practised, and probably had its origin, in the land of Israel; it is not unfrequently mentioned in the Old Testament as the many coloured pavement in porphyry, alabaster, marble, and then only to call attention, as it were, to a work of surpassing magnificence. In Greece, where art in its purest form was nurtured, this thoroughly legitimate style of ornamentation flourished to a marvellous extent. It must not be overlooked that the unscrupulous Roman conquerors carried this art, and artists too, from Greece to Rome, where the taste for display and magnificence, consequent on the accumulation of wealth, afforded ample opportunities for the artist "to surpass himself." Hence the most elaborate and best work is known as Greco-Roman work. It eventually became so congenial to the feelings of the Romans, that wherever they settled we find traces of this art; there are numerous specimens in the different museums of England. The simple geometric pattern that seemed so natural to the orderly mind of the Grecian artist were limits too narrow for his inventive genius; the beautiful labyrinth or fret, the ingenious imitations of the ever-varied anthemion or honeysuckle, the more complicated guilloche, and flowing lines of scroll work, in turn yielded to the more fascinating representations of real life, and pictures were produced rivaling in brilliancy of colours and variety of tint the finest productions of their best artists, with even the reflected lights so perfectly rendered that the very critical were forced to admire these wondrous works of patience and perseverance of the unrivalled Grecian artist. The finest specimen of their most elaborate work is known as "Pliny's Doves," or the "Doves of the Capitol." It is supposed to be a copy of the celebrated work of Sosos, of Pergamos, described by Pliny hence its name, and is in the museum of the Capitol at Rome. It is engraved and fully described in Cardinal Furlletti's treatise on Mosaic; he counted no less than 160 emblems of marble in one square inch. This valuable relic was found at Hadrian Villa, at Tivoli, 1737. Digby Wyatt describes it as follows:—"It represents a metal basin, on the edge of which four doves are sitting, one of them is stooping to drink; the shadow cast by it, and even the reflection of part of the head in the water is beautifully given; the execution of the plumage, the heads and eyes is most minute." This, like other arts during the decline of the empire, was neglected and abused, but never entirely lost; the asylum offered to Greek artists by the removal of the Government of Rome to Byzantium, for a while revived the dying embers of this beautiful embellishment and gave it a more exalted application, but its genuine purity was gone. The Eastern glitter and fictitious show was too much to their disordered minds, so the last faint sparks of Classic art died out, and left but a sorry substitute. Not only were they separate from all that could give grace and feeling to their works by leaving the hand of their birth, but a more powerful and relentless influence blasted every effort of art to rise, not only condemning but destroying the noblest works of their forefathers, because they exercised a religion they were taught to reverence, because

* Paper read before the Architectural Association by Mr. R. O. HARRIS. Continued from page 161.

they were Pagans. Well do they merit, indeed, the appellation of the dark ages. Thus left to their own resources a somewhat new style was the result, partaking of the gorgeous luxuriance of the East, and known as the Byzantine type of Christian Mosaic. About the fourteenth century fresco painting produced a powerful rival to this popular style of surface decoration; the gold grounds and swarthy visaged saints, with all the conventional inexpressiveness and primitiveness peculiar to early Christian art, gradually yielded to the more imposing and readily applied fresco; but the Mosaic art was too widely spread and too congenial to Italian soil ever to be entirely forsaken. The dawn of a brighter age now gradually lighted up that barbarous one of destruction and darkness coeval with the introduction of Christianity. The light of learning and a free unprejudiced mind soon enabled the artist to value the ruins he had scorned, and surely they have left us most gratifying results. At Rome a successful attempt was made to restore the *opus figulinum* or *fictile* work common to Rome and Byzantium, and known as Modern Roman, with which the dome of St. Peter's is decorated, and numerous other buildings in Italy. There is a manufactory for teaching and learning this, supported by the Papal Government, at Rome; simultaneous to this was also started at Florence the restoration of the *opus sectile* with equal success, now known as the Modern Florentine.

I trust this brief historical digression from my subject will not be out of place; it will assist very much in rendering more comprehensive the further observations I have to make on the peculiarity of each kind of work, and it is very essential it should be rightly understood.

You will thus perceive there are three easily remembered divisions of our subject—the ancient, the mediæval, and the modern. This is a general division of the subject by those who have devoted much time to its classification. The most prominent of them are Ciampini and Purietta, whose elaborate works on the subject may be consulted with advantage by those wishing to thoroughly study the subject. To Mr. Digby Wyatt's treatise on Mosaic I am also much indebted for much information.

Ciampini gives the following classification of the subject. The Roman mosaic he divides into four styles:—1. The *opus tessellatum*, the most common kind, formed of cubes of different coloured stones or earthenware. They are seldom more than three-quarters of an inch square, or of a lozenge form and other shapes, ground or worked to the forms required. The Greek fret and its variety is a favourite border pattern to which these tesserae are easily applied. There are several imitations of this in the modern form of paving tiles. 2. The *opus sectile* is a class where ornamental forms, figures, &c., were cut out of slabs of marble and carefully fitted together; this is also called the *opus Alexandrina*, for having been introduced by Alexandria Severus. The pieces are sometimes of considerable size and of the most valuable material. The Pantheon, at Rome, is a fine specimen of this kind of work. 3. The *opus figulinum*, or *fictile* work, where the pieces are made of a kind of coloured glass, consequently, much less costly than the foregoing. Moreover, it is capable of giving an unchangeable gold ground, and admits of very extensive application, being readily cut in any required shape, and obtained in all variety of colours; it was first used in the Bath of Agrippa, 24 years B.C. (Pliny). 4. The *opus vermiculatum*, the most elaborate and costly description of mosaic work—the *travo picture de musico*; it embraces the true imitations of all figures, ornaments, and pictures in their proper colours, lights, and shades, by extremely small cubes of marble and glass, not unfrequently aided by the rarest gems. The before-mentioned "Pliny's Doves" is an example of the capabilities of this work.

The great difficulty of this kind of representation can be easily imagined, when every tint and variety of it must be given as in reality, and frequently by coloured pieces of material not the twentieth of an inch in diameter. There is yet another kind allied to this last, on which ancient artists appear to have spent much labour, in representing articles that appear on the floor as if fallen there. The masterpiece of Sosos, of Pergamos (the author of Pliny's Doves), was the Unwaxed Hall, and represented the fragments that would be found on the floor after a banquet. Mosaic work has also been applied to objects in the round; it is generally of a rude kind of work, and appears to have been beneath the notice of the best artists. There are some very eccentric specimens of this work applied to the hollows of twisted columns in the Museum, at Kensington, which, I think, cannot be cited as a very happy style of application. The next division is the Mediæval, or that known as the early Christian, extending from the time of Constantine to about the thirteenth century, and is more particularly known as Byzantine Glass Mosaic, and is but a further development of the *opus fictile* of the ancients; its application was mostly for mural decorations and church furniture of almost every description; it was a coarse kind of work, very far removed indeed from the perfection of the old Roman work. The pictures are frequently of a very large size, and the tesserae very irregular; the workmanship is also exceedingly coarse, yet their effect is stated to be very impressive; the brilliancy of the different coloured glasses, and the gold ground common to this class of work, is certainly capable of producing a splendour of effect not easily forgotten. Another application of this glass, or *smalto*, as the Italians term it, is to pavements, and known as glass tessellation; slabs of marble inlaid with different pieces of this material, composing the most elaborate geometric and other flowing patterns in colours and gold, and not unfrequently associated with the most valuable stones. A groove about half an inch deep is cut in the marble, and the different coloured *smalto* cemented in. The last kind of mosaic I will mention, from its purity of material and simplicity of arrangement, could not die. Neglected as it was, it struggled on, and burst forth again and again with new vigour; its Byzantine form may be considered a revival of the *opus sectile* of the ancients; grooves were cut in the slabs of the marble as in the preceding kind, but instead of coloured *fictile* material, small cubes of tesserae of the most costly marble were introduced in an endless variety of form and colours. A further development of this took place in the thirteenth century; advantage was taken of the natural colour offered by the material for natural and other pictorial representations. Limited at first to simple geometric forms, it gradually gave place to the more complicated arrangements known as Modern Florentine work, which brings us to the last division of our subject. The pieces of marble or other precious material, as agate, jasper, &c., &c., in the form of veneers on slate, were so shaped that the projection of one fitted into the recesses of another, their varied tints expressing the colours, lights and shades, of the representation intended. This beautiful work attained great perfection in the fifteenth and sixteenth centuries, when large historical compositions have been elaborately rendered in lights, half tints, and shadows, by means of the contrast of three marbles only (D. Wyatt).

The Roman is the more commonly used of the two modern revivals, the expense and difficult manipulation of the former very much restricts its use; while the universal applicability and comparatively inexpensiveness of the latter (or Roman) has gained for it that encouragement and patronage every civilised nation has yielded it but England. Surely the enormous wealth of this land far exceeds the limited revenues of the small, unselfish states of Italy, who sacrificed so much for their innate love of art and encouragement of all that is beautiful, and assisted the genius of their country.

NEW BARRACKS AT HAMPSTEAD.—The new barracks which are being built at Well-walk, Hampstead, for the 1st Royal East Middlesex Militia, are now nearly completed. The foundation-stone was laid in the summer of last year. The barracks consist of two wings, with guard-house attached. The entrance is gained by a flight of steps, which also leads to the parade-ground.

A WEIGHTY STEAM HAMMER.—Herr Friedrich Krupp, of Essen, Rhenish Prussia, whose steel works are, probably, the most extensive in the world, not long since added to his tools a steam hammer of unprecedented dimensions. The head alone weighs 45 tons, and the whole weight, including frame, anvil-block, &c., is upwards of 500 tons. This hammer has been lately employed for forging masses of cast steel upwards of 2 feet 6 inches square, and intended for mortars; but even the enormous impact of 45 tons has been found to be "too light," and it is understood to be the intention of Herr Krupp to erect another hammer with a head weighing upwards of 100 tons, the whole "implement" weighing considerably upwards of 1,000 tons.

HOUSE OF COMMONS.

TEMPORARY ROAD ACROSS HYDE PARK.

ON bringing forward an estimate of £2,000 for a temporary road across Hyde-park, Mr. COWPER said he did this in conformity with what he understood to be the wish of the House as expressed on a former occasion, when he had proposed to make a permanent road. This plan was not favourably received by the House, and he now proposed to take the means of providing a temporary road, which would serve for the additional traffic during the time the Exhibition was opened. He did not propose to make any great change—to construct a new road or to make a new bridge. His plan simply was, that carriages should be allowed to make use of portions of the park that were now reserved for riders on horseback. The line of road he proposed would enter Hyde-park from Bayswater at Victoria-gate. It would make use of the existing carriage drive until it approached the bridge over the Serpentine. The carriages would then go over that portion of the bridge now exclusively confined to riders. The road would then proceed to the south of the bridge until it reached Rotten-row. Here it would take rather less than half the present road, and then, passing to the left, it would leave the park by Queen's-gate. Carriages would then proceed to the Exhibition by Prince Albert-road. The road would be 35 feet wide, except over the bridge, where 30 feet would be sufficient. The bridge was 52 feet wide, and the space left for foot passengers would not expose them to any serious inconvenience. The sum of £2,000 might appear rather large, but the cost of making a road was from 3s. to 3s. 3d. a square yard, so that £2,000 was only a moderate estimate. The whole distance at present used by horses, and which would be traversed by carriages, was more than half a mile, namely, 1,100 yards at the width of 35 feet. A payment of 3s. 6d. a square yard would make the sum of £2,000. Less than this could not be allowed for labour, metalling, and certain railings and fences necessary in order to separate the carriages from horse and foot passengers. When the road ceased to be employed the material might be taken up and a portion of its value repaid, either by sale or other use of the material. He proposed that this road should be open to all carriages conveying passengers to the Exhibition. Hackney cabs and omnibuses would be allowed the free use of the road, but it would not be open to carts and waggons conveying goods. Any conveyances carrying human beings to the Exhibition would have the right to use the road. He might have taken a shorter course for the new road, but it would have cut up the park more. Or if they were to follow the way straight across the grass, to the south of the Serpentine bridge, the omnibuses, cabs, and carriages which would use that road would come into direct contact with those which might be proceeding from the eastward. But by the road he proposed all the carriages coming from the north would be taken out of the way of those coming from the east. He did not propose to interfere with any of the existing roads, to alter any boundaries, or to encroach on the grass, but only to alter a portion of Rotten-row, so as to enable carriages to go where riders now went. The riders would have 30 or 35 feet to themselves, and would also have the pleasure of going in the same direction as the carriages.

Mr. B. COCHRANE said there was a road going right through Kensington-gardens which had been used by riders at the late Exhibition without any inconvenience. They had only to stop Rotten-row where the gates at the end of this road opened upon it, and allow carriages to pass, and they would have a road just fit for the purpose at an expense of some £200 or £300.

Lord FERMOY supported the plan of the First Commissioner of Works, but suggested as an improvement that the whole of the bridge over the Serpentine should be thrown open to the carriages, and that a temporary pontoon bridge should be erected for the convenience of foot passengers.

Sir M. PETO said the road now proposed was, in his opinion, the very best that could be devised. Instead of a pontoon bridge, he would suggest that Captain Fowke, who had so signally succeeded in the Exhibition building—(a laugh)—should be asked to construct a footway of timber, some 13 or 14 feet wide, outside the present bridge.

Mr. LOCKE saw no necessity for the making of a temporary road to the Exhibition. No such course was adopted in the case of the Exhibition of 1851, and yet the inhabitants of London to the north of Hyde-park contrived to get to it. There were roads all round the park, and he did not see why, during the Exhibition, public carriages might not be permitted to pass along them. On the continent, cabs were not looked upon with the horror with which they seemed to be regarded in this country. Until some reason was shown why in the case of this Exhibition means of access were required which were not found necessary in 1851, he should vote against the proposition.

Lord ELCHO said that as population increased there must sooner or later be a road across Hyde-park. The Committee should look at the question as one of a permanent, and not of a temporary character. He could not approve the suggestion that Captain Fowke, who had already produced some very singular pieces of architecture, should be allowed to lay hands on the Serpentine-bridge. He thought the proposed road across Kensington-gardens the most desirable.

The vote was ultimately agreed to.

WORKS AND PUBLIC BUILDINGS.—The following facts are obtained from a Parliamentary abstract. For the royal palaces the receipts in 1860-1 were £88,099, the balance on March 31 being £30,722; for public buildings the receipts in 1860-1 were £193,418, the balance on March 31 being £90,067; for furniture the receipts in 1860-1 were £52,143, the balance on March 31 being £17,504; for royal parks, pleasure garden, &c., the receipts in 1860-1 were £160,660, the balance on March 31 being £68,751; for the New Houses of Parliament the receipts in 1860-1 were £122,321, the balance for March 31 being £47,838; for Probate Court, London and District Registries, the receipts in 1860-1 were £28,653; the balance on March 31 being £20,010; for Industrial Museum, Edinburgh, the receipts in 1860-1 were £1,500, the balance on March 31 being £15,000; for National Gallery (additional accommodation) the receipts in 1860-1 were £15,000, the balance on March 31 being £4,152; for temporary Foreign Office the receipts in 1860-1 were £10,000, the balance on March 31 being £6,213; for new bridge at Westminster the receipts in 1860-1 were £71,778, the balance on March 31 being £19,830; for Westminster-bridge approaches the receipts in 1860-1 were £83,493, the balance on March 31 being £81,662; for New Foreign Office the receipts in 1860-1 were £26,900, the balance on March 31 being £26,900; for the Nelson Column the receipts in 1860-1 were £6,000, the balance on March 31 being £6,000; for Chelsea bridge the receipts in 1860-1 were £3,511, the balance on March 31 being £950.

THE MODERN SUPPLY OF WATER IN ROME.*

THREE aqueducts convey water in Rome, viz.: those of the Aqua Vergine, Aqua Felice, and Aqua Paola; the two first are exclusively derived from springs; the Aqua Paola is partly from springs and partly from the Lago Bracciano.

The unit of measurement of the Aqua Vergine is gauged by means of a horizontal tube called *fistola*, of 7.33 English inches diameter, and 10.99 English inches in length, adapted to the vertical side of a reservoir, in which water is maintained constantly at the height of 10.99 English feet above the centre of the delivering orifice.

The discharge through this orifice under these conditions is called an *uncia* or "inch," and is equivalent to a supply of 0.103 gallons per second, or 8,899 gallons per 24 hours.

For the Felice and Paola supplies the orifice is reduced to one-half, so that an "inch" of these latter corresponds with a discharge of 0.0515 gallons per second—4,449 gallons per 24 hours.

The Aqua Vergine is the same as the ancient supply under that name conducted into Rome by Agrippa, in 732. Tradition tells at the present time, as of old, that the name was derived from a peasant girl, who pointed out the source to some weary soldiers. The present position of the source corresponds exactly with that described by the ancient writers. But, on comparing the length, rate of inclination, and volume discharged of the ancient system with those of the present day, there are ample reasons for supposing that the ancient aqueduct having been destroyed, the modern one was not sufficiently studied as to its rate of inclination, &c., so as to obtain an abundant supply.

The canal of the Vergine is about 52,496 feet in length, and it arrives in Rome at a height 73.49 feet above the sea; the rate of inclination is only about 1 in 2,000. The section of the aqueduct is 3.94 feet wide, and the quantity of water furnished 14,526,600 gallons per day. The Vergine water arrives at Rome, passing under the Villa Medici, occupied by the Academy of France, and is discharged into the "Spanish Square," where it supplies a fountain. From the latter a special conduit leads water for the Trevi fountain. Deducting the latter as waste water, the useful supply is 1,145 inches, or 10,212,200 gallons per day.

The Aqua Felice supply dates 1555 to 1590. Its length is about 108,273 feet, its height on arrival at Rome about 180 feet; inclination, 1 in 4,000; width of culvert, 2.75 feet. It comes into the city on the ancient arcades of the Marcian Aqueduct, and is distributed by means of water-towers called "Moses's Fountains." The principal branch main is laid on to the Pontifical residence. It furnishes 1,169 inches, or 5,201,623 gallons.

Pope Paul V. (1605 to 1621) caused water to be brought into Rome from new sources, but he mingled therewith the waters of the Lago Bracciano. The Paola canal is about 170,612 English feet in length; its height above the sea on arrival in Rome, 249 feet; rate of inclination, about 1 in 610; width of culvert, 3.12 feet, delivering 19,809,000 gallons per diem. This supply enters Rome on two points—one near the Vatican, for the service of that palace, the other at the summit of the Transtevere, where one portion supplies the Paulina fountain, the rest working a set of flour mills occupying one side of the principal street of Transtevere. The volume of water supplied by the Paola is 1,816 ounces, or 8,080,751 gallons. These three aqueducts furnish at present 39,618,000 gallons for a population of 170,000 inhabitants, but the actual quantity of water delivered for public and private uses is only 23,494,574 gallons—about the same amount as the town of Paris takes from the Canal d'Oureq.

As to the quality of the waters, the Vergine is excellent. The Felice is impregnated with carbonate of lime, and forms deposits, causing obstructions in the smaller pipes. The Paola does not contain salts in solution, but, like all water derived from lakes, is subject to solar influence, and rendered impure by mud and weeds.

M. Oudry has given a tabular analysis of the different waters; it is the only one he could find in the archives, and they date back some thirty years.

The distribution is thus arranged:—The Vergine supplies the lower portions of Rome, the Felice serves the elevated portions of the left bank of the Tiber, and the Paola is carried to the higher grounds of the right bank (Transtevere).

The public supply of the Vergine feeds thirteen fountains of a monumental character, and thirty-seven small fountains. The Felice supplies twenty-seven large fountains, and the Paola feeds ten. The flow of water is continuous, both in the smaller and in the more important fountains; among the latter we may notice the Trevi, Sixtine, and Paulina fountains.

For private use pipes are laid on, as anciently, from water towers. The diameter of the tubes is regulated according to the value of the concession; the surcharge on the centre of the orifice is constant. Concessions are

made by means of a tube 10.99 inches long, fitted horizontally to a vertical tube, in which the water is maintained at a uniform height of 10.99 inches above the centre of the orifice. To facilitate the placing of these tubes, at certain distances slabs of white marble are inserted into the façade of the houses indicating the name of the water supply, and the height to which it will rise. These concessions of water are made for perpetuity at a rate of about £150 per inch, furnishing a continual supply to a fountain in the courtyard. At present the municipal council only disposes of a single inch to each subscriber or concessionist. The different inhabitants of lodging-houses draw water from the central fountain by means of a wire guide-rope, which conducts a bucket from the higher stories to the fountain and back again by means of a rope and pulley fixed to the upper part of the window. In some buildings water is raised by a wheel worked by the sewers. Some of the well water in Rome is of excellent quality.

D.

CONSOLE AT VERONA.

CONSOLE AT VERONA.

SAN MICHELE has left many fine buildings in his native city of Verona, but none which better attests his genius than the beautiful Palazzo Bevilacqua. Like nearly all his works, it has an arched rusticated basement, upon which a Corinthian order rises, pierced with his favourite arched windows, the whole being crowned by an entablature having a richly carved frieze. The front is divided into seven intercolumniations, three large and four smaller ones, but on the ground floor all are pierced by similar sized openings. The larger intercolumniations have, however, an additional enclosing arch which rests on imposts. Each of the windows has a bold fretted sill borne by two of the consoles, shown in our engraving. They are splendidly carved. Equally bold and fine are the trusses on the frieze, which support the widely-projecting cornice with a continuous balustrade upon it. The larger intercolumniations in the upper order are each filled by a single arch resting on imposts, and having a carved keystone and figures in the spandrels. The smaller intercolumniations are filled by a smaller arch with a segmental pediment over it, but as this does not reach to the underside of the entablature, an oblong window is introduced over it, similar to that seen in the same architect's Palazzo Canossa.

DESIGNS FOR MANUFACTURES IN THE INTERNATIONAL EXHIBITION.

The Committee upon Art Designs for Manufactures have determined to take immediate steps to secure the proper representation of the works of deceased designers. They would be glad if proprietors of designs by Gibbs, Kent, Talman, Chippendale, Chambers, J. Wyatt, Adams, Bacon, Soane, Gandy, Jeffery, Wyatt, Flaxman, Stothard, Holland, Bridgins, Pitt (sculptor), Tatham, B. Wyatt, Pugin, Barry, &c., would offer the loan of them for exhibition during the time the International Exhibition is open.

ST. STEPHEN'S CHURCH, SPITALFIELDS.—MR. E. CHRISTIAN, ARCHITECT.

DESCRIPTION OF THE CENTRE PIER OF THE BRIDGE ACROSS THE RIVER TAMAR, AT SALTASH, ON THE CORNWALL RAILWAY.*

THIS communication embraced, in a narrative form, a detailed account of the preliminaries connected with the Albert-bridge, which crossed the river Tamar where it was only 1,100 feet wide, with precipitous banks and a depth of water to the surface of the mud of 70 feet. A dyke of green stone trap intersected the clay slate formation at this point, and cropped out to the surface above the water on the western bank of the river. It was ascertained, by borings made in the bed of the river, that rock extended from the eastern side to beyond the middle of the stream, covered with mud or silt to a depth of from 3 feet to 16 feet. Subsequently, a thorough examination of the bed of the river where a centre pier would probably be built, by means of one hundred and seventy-five borings made within a cylinder at thirty-five different places, over an area of 50 feet square, enabled an exact model of the surface of the rock to be prepared, showing the irregularities and fissures that might be expected. Eventually it was decided, from the information thus obtained, to erect one pier only in the deep water, instead of three, as would have been necessary for the spans required by the Admiralty; and when it was determined to proceed with the construction of the bridge, in 1852, it was decided that there should be two spans of 455 feet, two of 93 feet, two of 83 feet 6 inches, two of 78 feet, two of 72 feet 6 inches, and nine of 69 feet 6 inches; the total length, including the adjoining land openings, being 2,200 feet.

The centre, or deep water pier, intended to carry the weight of one-half of each of the two main spans, consisted of a column, or circular pillar, of solid masonry, 35 feet diameter and 90 feet high, carried up from the rock foundation to above high-water mark. Upon this were placed four octagonal columns of cast iron, 10 feet diameter, carried up to the level of the roadway, which was 100 feet above high-water mark. Upon the tops of the columns, cast-iron standards were fixed to receive the ends of the tubes and chains which constituted the trusses of the bridge. The weight at the bottom of the masonry foundation was about 9½ tons per square foot, increased, when the bridge was loaded by passing trains, to about 10 tons per square foot.

In the construction of the masonry pier, a wrought-iron cylinder, of boiler plates, 37 feet diameter and 90 feet in length, and open at the top and the bottom, was sunk through the mud of the bed of the river to the rock. The water was then pumped out, and the mud excavated; the masonry being built up inside, and the cylinder above the ground afterwards removed. It was expected that, by forming a bank round the cylinder after being sunk to the rock, sufficient watertightness would be insured for getting in the masonry. To provide, however, for the contingency of excessive leakage, the cylinder was so constructed as to admit of the application of air-pressure. As the surface of the rock, although very irregular and ragged, had a general dip to the south-west, the bottom of the cylinder was formed with a corresponding bevel, one side being 6 feet longer than the other. A dome, or lower deck, was constructed inside, at the level of the mud, and an internal cylinder, 10 feet in diameter, open at the top and the bottom, connected the lower with the upper deck of the cylinder. The 6 feet cylinder, previously used for the borings, was fixed eccentrically inside the other, and an air-jacket or gallery, making an inner skin round the bottom edge below the dome, was formed, about 4 feet in width, divided into eleven compartments, and connected with the bottom of the 6 feet cylinder by an air passage below the dome.

Details were then given of the construction of the larger cylinder, and of the mode of launching and floating it to its position. When accurately adjusted over the intended site, water was gradually let in, until the cylinder penetrated through the mud about 13 feet, and rested on some irregularities upon the rock, which caused it to heel over towards the east about 7 feet 6 inches. By letting water in upon the dome or lower deck, and loading the higher side with iron ballast, the cylinder forced its way through the obstructions at the bottom edge, and took a nearly vertical position. The air and water pumps were then set to work, and the greater part of the mud and oyster shells, which filled the compartments of the air-jacket at the bottom, was cleared out, and the irregular surface of the rock excavated; the bottom of the cylinder being now 82 feet below high-water. Subsequently, a leak having broken out through a fissure in the rock on the north-east, or higher edge, considerable difficulty was experienced in maintaining sufficient pressure with the air-pumps to keep the water down and the bottom dry. The leak was at length reduced, by driving close sheet piling into the fissure. When at its full depth, the cylinder was 87 feet 6 inches below high-water at the lowest place, and then a hemp gasket was worked under the edge of the cylinder, all round the outside, to assist its watertightness. A ring of granite ashlar, 4 feet in width and about 7 feet in height, was then built in the air-jacket; and a bank of clay and sand was deposited round the outside of the cylinder to compress the mud. When the water was pumped out of the body of the water below the dome, and the excavation of the mud was being proceeded with, a leak broke out, and the water overpowered the pumps. Additional engines and pumps were provided, and efforts were made to diminish the leakage with varying success; but as it required four pumps to keep the water down to 54 feet, recourse to air pressure in the body of the cylinder below the dome became imminent, and preparations for its application were made. To provide against the buoyancy, or upward pressure against the dome and cover, the 37 feet cylinder was loaded with 750 tons of ballast, in addition to its own weight of 290 tons. The pumps were then got into good order, and, by continual pumping, succeeded in keeping the water down. The mud was excavated, the cylinder below the dome securely shored across, and the rock levelled, when the masonry, in thin courses of granite ashlar in cement, in the body of the cylinder was commenced. As soon as the masonry reached the level of the air-jacket ring it was thoroughly bonded, the plates of the air-jacket being cut out as it proceeded. Upon the top of the bonding course, two courses of hard brickwork in cement were laid, making a perfectly watertight floor over the whole diameter of the column. Meanwhile the masonry of the air-jacket, where the leak occurred, was taken down, and the leak was diminished by additional sheet piling. The leak was discovered to have broken out at the same fissure as before, and had torn away the rock underneath the masonry of the air-jacket and bottom edge of the cylinder, but the masonry itself was undisturbed.

The next operation was to draw off the water above the dome and remove the ballast, to allow the masonry to be proceeded with, which it eventually did at the rate of from 5 feet to 7 feet in height per week. When it was 45 feet in height the influx of water was entirely stopped. After the masonry had been completed to the level of the plinth the upper part of the cylinder was unbolted at the separate joints and floated to the shore.

DECISIONS IN THE COURTS.

NEW LIGHTS IN REBUILT HOUSES.

Hutchinson v. Copstake.—Exchequer Chambers.—This was error by the plaintiffs to reverse a judgment of the Court of Common Pleas in favour of the defendants. At the trial a verdict was found for the defendants, subject to a special case, on which, on argument, the Court below gave judgment for the defendants. The declaration alleged the plaintiffs to be possessed of a certain shop and warehouse, in which there were of right, &c., divers windows through which light and air ought to pass, and that the defendants had built and continued a wall near to the said windows, whereby the light and air were hindered, &c. At the trial a verdict was taken for the defendants, subject to a special case, from which it appeared that the premises of the plaintiffs and the defendants respectively were situate on opposite sides of Broad-street, London, and facing one another, and that the plaintiffs' premises had been burnt down and rebuilt, and that the windows in them previous to the fire had been used for more than twenty years. It appeared, also, that the windows in the newly-erected building of the plaintiffs were placed in different positions and were of different sizes, and, upon the whole, occupied more space in the wall than the windows of their premises as they stood before the fire. Parts of some of the new windows were identical with parts of the old ones, but to a considerable extent the old and new windows did not coincide in dimensions. The case stated that the defendants could not have obstructed the passage of light to such portions of the windows of the plaintiffs' present warehouse as are new without at the same time obstructing the passage of light to such portions of the plaintiffs' windows as are in the sites of the old windows, to the extent stated in the declaration. The plaintiffs had besides broken some entirely new windows in the attics of their new premises. The obstruction complained of by the plaintiffs was that the defendants had raised their premises 37 feet higher than before, which darkened their windows, &c.

The judgments of the Court were as follows:—

Judge Crompton: On the argument before us the defendants contended that the new windows were not substantially the same as the old ones, and that as it was found the case that the new portions of the windows could not be obstructed without obstructing the portions in the sites of the old windows, the case fell within the authority of *Renshaw v. Bean*. The plaintiffs, on the contrary, contended that the new lights were substantially the same as the old ones; that the same amount of light and air ought to have come to their building, by whatsoever apertures they chose to receive it; that no more burthen was cast on the servient tenement by the one set of windows than by the other; and that even if the windows were substantially different, or increased in size, still the defendants had no right to obstruct the portions of the old lights that formed parts of the new windows; and they impugned the authority of *Renshaw v. Bean*. On comparing the tracings of the old and new buildings, and looking at the statements in the case, the old and new windows of the plaintiffs do not seem to us to be substantially the same; and I think that where, as in the present case, windows, to which a right has been acquired, are so far altered in their position and size, and confused with portions of new windows, that the owner of the servient tenement cannot prevent a right being gained to the new windows without obstructing such portions of the old windows as have been mixed up with the new lights, no right of action arises from such necessary obstruction of the remaining portions of the old windows. When the origin of the right to windows is considered, it seems to be clear, according to the judgment of Judge Patteson, in *Blanchard v. Bridges*, in which I entirely concur, that lights, in respect of which the right of action is sought to be enforced, must be substantially the same as the lights which have been gained by user or grant, and that no new light can be substituted without the consent of the owner of the servient tenement. The right to prevent the owner of the servient tenement from using his own land as he chooses must arise from the consent of such owner or his predecessors, and that consent must, as observed by Judge Patteson, have reference to the state of things at the time when it was supposed to have taken place, and cannot fairly be extended beyond the access of light and air through the same aperture, or one of the same dimensions, and in the same position. Since the Prescription Act, 2 and 3 Will. IV. c. 71, the right to light depends upon positive enactments, in cases falling within the provisions of that statute. By the 3rd section of the Act, "when the access and use of light to and for any dwelling-house, &c., shall have been actually enjoyed therewith for the full period of twenty years without interruption, the right thereto shall be deemed absolute and indefeasible." The extent of the right must be confined to that which has been actually enjoyed, and which the owner of the adjoining land did not interrupt, so that precisely the same reasons apply as did at common law. The doctrine so well explained by the above learned judge does not seem to me at all at variance, as was suggested by Mr. Smith in his argument, with the observations of Lord Chief Justice Campbell, in *Renshaw v. Bean*, where he says, "We by no means say that where the owner of a house alters the dimensions of an ancient window in it, he may in no case maintain an action for that which is an obstruction to it in its former state." This observation would be applicable, exempli gratia, to a case where an ancient window of 3 feet had an addition in height or breadth of 3 feet, which could be obstructed by a board or scaffolding, and where the old light being distinguishable, need not be interfered with in blocking up the new; and I perfectly agree in Lord Campbell's observations as applicable to such a case. In the present case the matter in respect of which the action is brought is not the thing granted, or to which a right has been acquired by user. It is not the thing in respect of which the owners of the servient tenement have become subject to a restriction that they should not obstruct, by doing any act on their own land which their pleasure or caprice may lead them to choose to do. We were pressed with the argument, that there was no greater amount of inconvenience to the servient tenement; and a case was cited where the Master of the Rolls was supposed to have held, that a party, having several windows in a house, could put out an intermediate new window between two old ones, where no apparent detriment to the owner of the servient tenement appeared to arise therefrom. I wholly dissent from this doctrine. I think that the right to restrict the owner of the adjoining land from building on his own land, gained by user or grant, must be confined to the subject-matter of such user or grant, and that the restriction on the owner of the servient tenement must be substantially the same, according to the rule as laid down in *Blanchard v. Bridges*. I do not think that the owner of the old lights can say, "that this new window I now put out will occasion you no harm, as you could not build so as to affect any of my new lights before, and this new one will not abridge your power of building." The new light is not one of the windows to which the original assent was given, and it may be that the owner of the servient tenement would not have chosen to acquiesce if the window had been in the situation of the new window. Suppose that a party has a back wall of his house with no windows, or very few windows, opposite to the front of his neighbour's house, the neighbour may very likely not object to a single window, which may not annoy him by being opposite to particular parts of his own house; he may be good-natured enough not to object to two such windows, and may allow a right to be gained to them; whereas an intermediate window might have made all the difference, and might have prevented him from at all acquiescing in any lights. On the other doctrine, an acquiescence in one unimportant light, which gave no annoyance, might be made to operate so as to give a right to lights which might be a great annoyance and interference with the privacy of the servient tenement, and in which the owner of the servient tenement never would have acquiesced. Can it be the law that a man who has one window in the back of his house can say to his neighbour, "My window is so situate, that any increase in your house would interfere with some rays of light, and therefore I have a right to fill the back of my house with windows, which you must not interfere with?" I think that the true doctrine is, to confine the right to what this use

* Read before the Institute of Civil Engineers by Mr. R. P. BREBETON, M. Inst. C.E.

* This case is fully reported in the *Jurist* for January 25th.

points out. We do not, however, say that a right to have any quantity of lights that a person could put in his house might not exist as against his neighbour. Such a right might be created by grant, and might probably be presumed from very peculiar circumstances, as if the owner of the dominant tenement for a long course of years had continued to change his lights from time to time, and such changes had been acquiesced in from time to time for long periods; but in general the right must, I think, correspond with the user of the particular light or lights. We are much pressed with the supposed hardship of the case; but I think where a party has to rebuild his house, he should take care that he places the windows in their old situations, and makes them the same size, and before he substitutes or adds lights substantially different in size or position, he should make a bargain with his neighbour; and we think the hardship would be greater the other way, if the servient tenement could be made subject to a different set of lights than those to which the owner had assented, and which new lights might be such as he would have dissented from if originally proposed, and which might affect the privacy of different parts of his tenement. It was also asked, what would be the case if there were two adjoining buildings, and the owner of one of them should substantially alter the lights, so that the owner of the servient tenement opposite to the both of them could not block up the new lights without blocking up the old lights, in respect adjoining neighbour? To this we answer that, in the first place, would be the same identical obstruction of which an action would or might be brought, would be the same identical unchanged lights; and, in the second place, that the owner, complaining of the blocking up of his ancient lights, would not, by his own act, have put the owner of the servient tenement into the situation of not being able to block up the new lights without blocking up the old; so that the very reason on which the case of *Renshaw v. Bean* was decided would not be applicable. As I think that the new and old lights in the present case are not substantially the same, and that the old lights are, by the act of the plaintiffs, so confused and mixed up with the new lights that the latter cannot be blocked up without obstructing the former, and, therefore, that according to the principle I have referred to, this action cannot be supported, I am of opinion that the judgment of the Court below should be affirmed.

Judge Blackburn: My Brother Hill concurs in the above judgment of my Brother Crompton. My Brother Channell and I concur in the judgment of my Brother Crompton, but are desirous of adding for ourselves, that in the present case, in our opinion, no question arises as to the right of the owner of adjacent land to use it, so as to block up an ancient unaltered window, on the ground that the person who has a right to that window has also opened a new one in such a position that the owner of the adjacent land must either block up the ancient window, or submit to the enjoyment, without interruption, of the new window, so as, after twenty years, to make the right to the new window indefeasible. We consider that a very different question, on which, if it were raised by the facts, we should be bound to deliver an opinion; as it is, without doing so, we rest our concurrence in affirming the judgment on the ground that, on comparing the tracings which are part of the case, we find that no one of the plaintiffs' present windows substantially corresponds with an ancient window; and we draw the inference of fact, that no one of the present lights claimed is a continuation of one of the ancient lights. We perfectly concur in the reasoning of my Brother Crompton, by which he shows that the new and the old windows may occupy, in fact, the same space, without the right to light claimed through the new window being the same light as that enjoyed for twenty years, without interruption, through the old one.

Baron Bramwell: I concur in this judgment solely on the ground that no one of the existing windows occupies the same position as any one of the ancient windows did, and consequently that by no one of them have light and air been enjoyed for twenty years, and so no right has been acquired in respect of any of them against the defendants.—Judgment affirmed.

PROGRESS OF THE METROPOLITAN MAIN DRAINAGE WORKS.

AT the last meeting of the Metropolitan Board of Works, held at the Offices, Spring-gardens, on Friday, Mr. BAZALGETTE, Engineer-in-Chief of the Board, reported that Mr. Furness had made considerable progress with the Northern Outfall Sewer contract during the past month. The iron superstructures for the aqueducts over the river Lee and the Bow and Barking railway are in course of erection, and the ironwork for these and three other bridges was delivered on the ground. The tunnelling under the Eastern Counties railway embankment progresses slowly, but with safety to the traffic on the line, and the brick piers for permanently supporting the railway are now being built. The Stratford-road works had made fair progress since the last monthly report. A large addition has been made to the concrete embankments, and the brickwork of the sewers between the river Lee and East Ham church. From thence to the outlet at Barking Creek 120 of the arches forming the foundation of the permanent works across the marshes are completed, and the total value of the work executed up to the present time is about £210,000. On the Middle-level Sewer Messrs. Brassey and Co. have completed about 23,000 feet of brick sewer, varying from 4 feet by 6 feet to 12 feet by 9 feet, at an outlay of about £101,500. The rivers, overflows, and connections at the junction of the Ranelagh Storm Overflow with the Middle-level Sewer in the Uxbridge-road progress slowly, owing to the character of the work and from the confined space within which it has to be executed. Active measures have been taken for the removal of the surplus materials from Kensington-gardens, and for reinstating the surface, and these works have been nearly brought to a close. The total value of the work done is about £28,000. On the Southern High-level Sewer works Messrs. Lee and Bowles have completed about 7½ miles of sewer, at an estimated cost of about £149,000, and the extension of this sewer, under Mr. Pearson's contract, has commenced, and the work executed is valued at about £634. Mr. Webster has constructed about 6½ miles of the Southern Outfall Sewer with some heavy and difficult works thereon, at an estimated cost of about £276,000, and he will shortly complete this contract. At Deptford Pumping Station Messrs. Aird and Son have completed the brickwork of both engine-houses up to the level of Trinity High-water. The chimney-shaft foundations are in, and those of the boiler-house are in progress. 550 feet of double line of the Low-level Sewer are completed, and 3,650 feet of the iron pipes forming a connection with the High-level Sewer have been laid under Deptford Creek. 208 feet of sewer, 11 feet 6 inches in diameter, have been constructed to form a connection between the Pumping Station and the Outfall Sewer. The coal-sheds and dwelling-houses are nearly finished, and 170 feet of the wharf wall constructed. The Low-level Sewer is carried half way under Deptford Creek, and the cofferdam for the second half has been commenced. The value of the work done under this contract is £63,000.

THE INSTITUTE PRIZES.—We are asked to say that the design for a villa marked "Humber," the letter accompanying which was not opened at the meeting of the 3rd inst. in consequence of a mistake which the author has explained, is by Mr. Robert Clamp, of Windsor-street, Hull.

THE FINE ARTS IN SCOTLAND.—The Royal Association for Promotion of the Fine Arts in Scotland last year received subscriptions amounting to the sum of £5,185. Of this sum upwards of £2,000 have been expended in the purchase of fifty-five works of art. A large sum has also been expended in the preparation of the plates which are periodically distributed amongst the members.

THE ARCHITECTURAL MUSEUM.—DISTRIBUTION OF PRIZES.

THE opening meeting of the session of the Architectural Museum and distribution of prizes took place in the theatre of the South Kensington Museum on Tuesday evening, when there was a numerous attendance of the friends of the institution. The chair was occupied by the President, A. J. B. BENESFORD-HOPE, Esq., and amongst the gentlemen present were Mr. G. Gilbert Scott, Mr. Joseph Clarke, Mr. S. C. Hall, Mr. M. J. Lomax, Professor Partridge, Mr. A. W. Blomfield, Mr. C. F. Hayward, Mr. W. C. Cocks, Mr. C. W. Cooke, Mr. S. Ferrey, Mr. Hakewill, Mr. Trevor Crispin, Mr. Pearson, Mr. Slater, Rev. Temple Frere, Mr. Knight Watson, the Rev. William Scott, &c. Letters of apology for non-attendance were received from, amongst other gentlemen, the Duke of Buccleuch, Earl of Powis, Earl de Grey, Bishop of Oxford, Sir Walter James, Bart., Sir Gardner Wilkinson, Mr. Cole, and Professor Donaldson.

The CHAIRMAN said they were assembled that evening as often heretofore for the purpose of carrying out what was the main and principal intention of that their Museum—distributing the annual prizes to those who had gone into and been successful in their competition. Though that was the main object of their institution, it was not the only one, as he should hope, in the few words which, with their kindness, he proposed to address to them, to prove. But before going into any details of the administration of the last year, there was one topic which he was sure must rise spontaneous to the mind of every one who loved and cared for the fine arts in this realm—must rise with a more particular significance with those of the Architectural Museum, and which must be accompanied with feelings of regret at the sudden and irreparable loss that fell on this land in last December. They all of them knew how devoted the Prince Consort was to everything that was calculated to conduce to the happiness of that country which he made and which made him his own. They knew the Prince was great because he never aped greatness; they knew he was popular because he never thought of popularity all his life; and the people knew not how they cared for him until he was lost. As a patron of art, in more than any other aspect, the Prince came before the public with credit and renown. They now knew, however, that not only by his patronage did he promote the fine arts, but that he did it also by the exercise of that influence which could be legitimately carried out, and which, though still without ostentation, was never wanting in the matter of the promotion of art, or in the matter of furthering all good art objects. And so the late Prince a few years ago most kindly and most generously accepted the office of patron of that their Architectural Museum. So that by his demise they were officially deprived of their head, their chief officer, as well as being sharers in the great national grief. So, he said, they could not that night enter upon the business of the evening without first paying that tribute of regret which all Englishmen and all Englishwomen must pay to the tomb of the Prince and the throne of the Queen—(Applause.) Officially they had done so already; officially their address of condolence had been drawn up; and though they knew no single address of condolence could materially affect the august occupant of the throne, yet the accumulation of that great tide of grief from every class, from every rank, from all denominations, from every sphere of life—it was that great tide of grief, flowing up silently and quietly, which must testify what was the loyalty of the land, and must be, in her darkest hour of sorrow and grief, a source of solace to our Queen—(Hear, hear.) Having discharged what seemed to him a becoming duty, he would proceed to the more immediate business of the meeting. The Architectural Museum had for the last two years been in a transitional state. Those who took an interest in the Museum would remember that the work for which they were directly established shaped itself into three classes—first, the accumulation of articles forming an architectural museum as perfect as possible, chiefly Mediæval, but not so exclusively; secondly, the delivering of architectural lectures; and then, thirdly, the teaching and encouraging of art-workmen by offering prizes. Those three distinct, but at the same time congruous and harmonious objects, were what the Architectural Museum existed for. With regard to the first of those objects, the collection of a museum of architecture, they knew full well they were first in the field; they knew full well that when every one doubted, shrunk, did not or would not understand the matter, the promoters of the Museum came forward and established it. They made a collection, of course at first not very systematic; they were beholden to friends, and of course it was not for them to be particular at first. So they collected, and, as time went on and they got more articles, they became more fastidious, and their friends became more careful in what they gave to the Museum. And ultimately they should have thought of refusing, and their friends would have hesitated before giving them, anything that did not stand high in the order of merit. This Museum, however, had limits, but a man's ambition had no limits. Accordingly the question space came on, and with it the question of disputed jurisdiction, but no one had a right to be ashamed of anything that took place. The question arose between the directors of the Museum and the custodiers of the building in which they were assembled, and thus had arisen difficulties. Matters came to that state when negotiation and arrangement became necessary. Those negotiations and arrangements were still being prosecuted, and not yet consummated. It was one proposal in their negotiations that that portion of their collection down there should be handed over alone to the authorities of the South Kensington Museum, but the ownership of the Architectural Museum was to be asserted, and it was also provided that their collection should form a portion of a future collection of architecture. And it was also provided, in terms quite sufficient to be perfectly stringent on gentlemen acting together for the attainment of a common object, that the opinion of the directors of the Architectural Museum should not be rejected—he did not say it was in writing—but it was understood that the opinion of the directors of the Museum should have weight with the authorities of the South Kensington Museum in the purchase of future portions for collection. In agreeing to these terms, of course the directors of the Architectural Museum sacrificed something of personal feeling. He would not have them believe, as little would he have the authorities of the South Kensington Museum believe, indeed, no one supposed, and no one could suppose, it would not have been more pleasant and more agreeable to them to have had, as heretofore, the collection and arrangement of a national museum of architecture—(Hear, hear.) But there were certain reasons, a few courtesies, certain etiquettes and arrangements, incident to a large department, which rendered it impossible for the Architectural Museum to be an *Imperium in Imperio*—to be a separate establishment in the South Kensington Museum; and still they had not the means of setting up their own Museum in another and distinct department. In short, the whole thing was, in the broad sense of the term, a negotiation and a compromise. They entered into it cheerfully, and he hoped and trusted the

manner in which they entered into it would, with the other side, keep things going in a proper manner. Still, at the same time, they could not but regret giving up that independent position they held while tenants of the premises in Cannon-row—(Hear, hear.) But if hereafter a great architectural museum should rise up, and if it did go on to form a school of architects, and artists, and artist workmen, then he said that all those who wished the rise and progress of this museum of theirs would be beholden to say that the Architectural Museum, late of Cannon-row, held the same position towards the South Kensington Museum as the collection of Sir Hans Sloane held in the British Museum, for without it, probably, there would have been no British Museum, and but for the exertions of Mr. Scott, of Mr. Clarke, Mr. Clutton, and other gentlemen, some years ago, this great collection of architectural casts would not have been in existence.—(Hear, hear.) So much for the state of the Architectural Museum. The negotiations with the Government were still under consideration, they were still hung up; in fact, nothing had been done—(hear, hear)—and so they stood, as before, at the present. The Government was rebuilding the building in which they were met, and everything was in a mess, in short—(A laugh.) He hoped they would be able to find room for the Indian collection, sent to the Architectural Museum by a kind and excellent friend in Bombay, Sir Bartle Frere, and which was still in packing-cases. The second branch of the subject was the delivery of lectures at the Museum. He might remark, however, in passing, that if the Government undertook to buy the future architectural collections, and if the thing worked well, as they hoped and trusted it would, it would free more money for other operations that existed, as lectures and prizes for art-workmen. As to lectures, it had been doubted whether the lectures helped on the accumulation of their casts, whether art-people were the people that came to them, and whether it was not people in easy circumstances who, to a great extent, attended the lectures, and not art-workmen. It might be admitted, that, to a large extent, such had been the case, but he would go on and say, what then? When they had a society like this, using various measures of utility for good, was it necessary that all should hang on each other? Could not a railway company start two lines for two places without having a loop; could it not have a line north and one south as well? He thought it could. Their collection was one thing, the lectures were another, and the prizes offered to art-workmen were a third. While the directors appealed to their special friends—the art-workmen—to come to the lectures and listen to them, they did not intend to prepare those lectures exclusively for that class. Architecture was an art which opened fields of observation for many, who made it a very useful and profitable study, and who derived much instruction and amusement in listening to the interesting details of the studies of other people. There was no course of popular lectures on architecture given in London. The lectures given at the Royal Academy were intended for the benefit of students, and the Architectural Museum had set up their lectures simply as a course of architectural lectures. Since then the Architectural Exhibition, at the galleries in Conduit-street, had started architectural lectures. What was the result? Their lecture-room was filled, and the Exhibition galleries filled on the lecture nights. Both sets of lectures at the present time took, and attracted full audiences. Now, just look at the list of lectures the Architectural Museum had for the present session. There was first a lecture, by Mr. E. A. Freeman, "On the difference between Minster and Parish Churches," and that gentleman was better qualified than most men to handle such a subject. Lord Alwyne Compton was to deliver a lecture "On Encaustic Tiles and Tile Pavements," and that nobleman knew more about encaustic tiles, perhaps, than any other man they knew. The above were two square men standing on square subjects for lectures. Then there was to be a lecture "On Jerusalem," by Dr. Pierotti, who had studied at the Holy City, and would be able to give much useful information gathered on the spot. He would be accompanied by an interpreter, Mr. George Williams, as the Doctor could not speak a word of English. The next lecture would be by Mr. William Burges, "On Colour," and they all knew how able that gentleman was on the subject of colour, and from him might be expected a very able and learned discourse. Then followed Mr. George Williams, in a lecture "On Georgia and Armenia," countries which had not been much visited by architects. The next lecturer of the session would be Mr. G. Gilbert Scott, "On the formation of a National Museum of Architecture, as viewed especially in its connection with the Mediaeval styles." Mr. Scott was the founder of the Architectural Museum, one who had thought more soundly on this subject than any other man, and his lecture might be expected to be a *ministerium pronunciamiento*.—(Applause.) Then the lecture of Mr. Thomas James was to follow, "On Labourers' Cottages," and much might be expected of it. Well, then he came to the third branch of the work of the Institution, namely, prizes. Their Museum was instituted for the study of minute details of architecture. Though an advocate for large cathedrals instead of small churches; though an advocate for bigness pure and unadulterated, bigness and nothing but bigness—(a laugh)—while he stood up for bigness he was not blind to the fact that there was something else that might not be despised, and that was grace, proportion and beauty in detail—(hear, hear)—for anything like proportion in art surely embraced both bigness and details of architecture. This Museum, instead of insisting on bigness, followed out the study of details, even the smallest matter on which man's handwork was apparent. And here he should point out what it was important to know—that they did not exist to make architects or artists. They did not expect, and did not want, to make a single artist; artists were made at the Royal Academy. What they wanted to make at their Museum, or through its instrumentality, was art-workmen, or rather to make workmen work in an artistic and proper manner. This year, particularly, they were bound to unfurl that standard, and to proclaim, loud and long and deep, that that was their object—(Hear.) This year the great Exhibition was to be opened, and whatever objections might be entertained to the building itself, that should give rise to no prejudice as to the contents of that building. As to those who should look at the working of that Exhibition, the great matter that would strike an observer would be the manner in which the whole of the Exhibition displayed itself; how completely the whole arrangements of that Museum showed the utter impossibility of distinguishing where art ended and manufactures began, or where manufactures ended and art began. The extraordinary interpenetration in every hole and corner of the Exhibition would be astonishing. That was true and philosophical. Every handwork of man, such as a steam-engine, a carriage, a patent mangle, or a wringing machine, every handwork of man was, so far as form was concerned, a work of art. On the other hand, the Venuses, the Apollos, and Madonnas, the works of Raffaele and other great painters, produced by the hands of man, were still works of art.

Arts and manufactures ran so close together that it was difficult to draw a distinction between them. There were some things in which manufacture was close to art, such as the steam-engine and wringing machine, but still it was not to be called art, while as to great pictures, so full of the ideal, no one could call them anything but works of art. But between them lay the great border states, which might belong neither to art nor to manufacture. That was the ground they wished to make their own, and on which their Museum wished to distinguish itself. By standing up there as an advocate of manufacture, he felt he had a right to do so, not personal but hereditary. He could not but remember that it was his father—in spite of the jokes of Sydney Smith—that his father was the man who, fifty years ago, first stood up to say that all objects of commerce might be said to have rules of beauty as well as works of art. And long before the Architectural Museum was founded, the good seed sown by Thomas Hope brought up an abundant harvest. But, till this Museum was founded, nothing had been done except to found designers, or create designs by a superior being. The Architectural Museum did not go in to educate designers from above, or to create a school of designers. They went in to rule the quality of those men who had to carry the designs out—they went in to teach the workmen, with their hands trained and their minds disciplined, to understand what they were doing, and to carry out their work with love and freedom. The system of creating designs was good and right; if it had not come in their work would have been impossible. But the functions of the Architectural Museum were not those of a school of design; they competed with no school of design, but they were a college where the workman might understand the craft, the secret, the *arcana*, and work out a design in the spirit of the designer. Then, they were told that they were only the Architectural Museum. What was the meaning of architecture? He should like anyone in that room to stand up and say where the limit between architecture and any other art was passed. The distinction between architecture and art was one of those things which it was utterly impossible to grapple with. Was not metal-work architectural in everything except fire-arms and knives and forks? Take again wood-work, such as a table, a chair, a sofa, or a bureau. They might be driven to say all art was architectural except pictures, but when pictures were painted for a particular building it would be found they were made for a particular locality, and thus became architectural. It was gratifying to find the way in which this Architectural Museum of theirs had gone ahead in taking up minute details without much association or much exertion, and that they were working as an art museum instead of an architectural museum. He had no doubt that different gentlemen in that room—friends of the Architectural Museum—would exhibit specimens in different classes at the forthcoming Exhibition. No power of philosophical reasoning could show why the men showing specimens at the Exhibition appeared in different classes; any power of classification was a mere matter of private book arrangement. For example, as far as those who had been able to judge of what the coming Exhibition would be, there would be more than one court and more than one department in which there would be a peculiar exhibition of the connection between art and architecture amongst gentlemen who carried out the views they had all broadly enunciated in that room. There were two courts in two different classes that were both exemplifications of the broad principle on which the Architectural Museum was first started, and in one of which there would be space reserved for this Museum, in which the more meritorious prize-works exhibited that evening were to be displayed. This rather roundabout journey brought him to the specific and proper object of their gathering that evening, which was—first, to give prizes to those who had earned them, and, in the second place, to listen to those remarks which might be made, prompted by the occasion, short, and to the purpose, by friends of the Institution present, who never allowed such occasions to go past without giving expression to the results of their mature, candid, and friendly experience. Last year the Institution started with the giving of a larger amount of prizes than they had done before. Now, from not purchasing specimens they had more money to sport on prizes, and the directors thought they should act wisely in doing so, both for the advancement of the prizemen and for the credit of the Institution, seeing that the Exhibition was to take place this year, on a gigantic scale, for the very objects they had in view. And the directors acted upon this principle—of not giving prizes when a certain scale of merit was not obtained, but still without looking for an extraordinary amount of merit—(Hear, hear.) The prizes were for young aspirants, not for those who had long held the spurs and occupied the most honourable seats. What they wanted was art of comparative moderate excellence for prizes. This year, when they had more competitors than usual, the question of the line to draw was to the judges a matter of anxiety. When he was a boy at school and wrote for prizes, he used to think it was an easy matter for the judges to decide upon the essays, and that it was a difficult thing for the boys to write for the prizes. But now he thought the judges of contributions had as much difficulty and anxiety, or more so, than the competitors themselves. They started last year with more money in their pockets than previously, and other friends came forward to assist them, amongst whom were Mr. S. C. Hall, with his magnificent donation of books, and Sir Francis Scott, who gave a prize of a very large amount; but that prize was offered in a class in which the merit of the works sent in was not such as to justify them in awarding a prize. The Ecclesiological Society also gave prizes. The ironwork in the first class did not receive any prize, nor was the prize awarded for painted glass; and in the miscellaneous class of prizes the regular prize was not given, though to two competitors prizes had been awarded. There had this year been sent, in competition for prizes, a much better lot of specimens than on any previous year, especially in wood carving. The Chairman then proceeded to deliver the prizes to the successful competitors, making, as he proceeded, comments upon the productions of each. The following is a list of the successful competitors:—

PRIZES FOR STONE CARVING.

The Council of the Architectural Museum offered two prizes of £10 10s. and £5 5s. as first and second premiums to the competitors who should most successfully design and execute in high relief a carved stone panel, 2 feet by 2 feet (outside measurement), representing Queen Eleanor watching over Edward I. when wounded. Seven specimens received.

Prizes Awarded.

Prize 1.—£10 10s., and a certificate, to Mr. Samuel Ruddock, of 22, Bloomfield-terrace, Pimlico.

Prize 2.—£5 5s., and a certificate, to Mr. E. W. Thornhill, at Messrs. Hardman's, Dublin.

Extra Prize.—£1 1s., Mr. John Gould, 1, Union-terrace, High-street, Camden-town.

SECOND STONE CARVING COMPETITION.

The Council also offer two prizes of £5 5s. and £3 3s. as first and second premiums to the competitors who should most successfully design and execute a carved and moulded stone capital, suitable for a column 9 inches in diameter, showing the best arrangement of

hawthorn and ash foliage, which may be conventionally rendered. Eleven specimens received (one not within conditions of competition but to which an extra prize was awarded under the head of sundry specimens).

Prizes Awarded.

Prize 1.—£5 5s., and a certificate, to Mr. James Allen, 109, Lillington-street, Pimlico.
Prize 2.—£3 3s., and a certificate, to Mr. John Daly, 26, Wilson-street, Westminster.

PRIZES FOR MODELLING IN CLAY.

The Council of the Architectural Museum offered two prizes of £3 3s. and £2 2s. as first and second premiums to the competitors who should most successfully execute in the Architectural Museum a model from a cast representing one of the "angelic choir" from the north transept of Westminster Abbey. No specimens received.

PRIZES FOR WOOD CARVING.

The Council of the Architectural Museum offered two prizes of £10 10s. and £5 5s. as first and second premiums to the competitors who should most successfully design and execute in lime or other soft wood a door panel, with pierced tracery and foliage, of not less than 2 feet by 1 foot 4 inches in extent. Thirteen specimens received (one specimen not within conditions of competition, but an extra prize awarded to it under the head of sundry specimens).

Prizes Awarded.

Prize 1.—£10 10s., and a certificate, to Mr. Henry Reynolds, 22A, Storey-street, Caledonian-road.

Prize 2.—£5 5s., and a certificate, to Mr. C. J. Herley, 2, Camden-place, South-street, Taunton.

Extra Prize.—£1 1s., and a book, to Mr. H. J. Wicks, 76, Coleshill-street, Eaton-square.

Extra Prize.—A book, to Mr. John Seymour, of Tower-lane, Taunton. (An extra prize for wood carving was awarded to this competitor last year.)

Extra Prize.—A book, to Mr. Alfred Angus, 12, Belvoir-terrace, Vauxhall-bridge-road.

PRIZES FOR METAL WORK.

The Council of the Architectural Museum offered two prizes of £10 10s. and £6 6s. as first and second premiums for the competitors who should most successfully execute in hammered from a copy of a portion of the scroll-work (about 2 feet 6 inches high by 2 feet broad) in St. Paul's Cathedral. No specimens received for this competition.

SECOND IRONWORK COMPETITION.

The Council of the Architectural Museum also offered a prize of £10 10s., and Sir Francis Scott, Bart., a prize of £5 5s., as first and second premiums, for the competitors who should most successfully design and execute a wrought-iron door-handle, either Gothic or Renaissance in style, and not less than 6 inches over. The ornamental workmanship of any specimen must not interfere with its convenient use. Three specimens received, but no prizes awarded, the specimens not being thought worthy.

PRIZE FOR PAINTED GLASS.

The Council of the Architectural Museum offered a prize of £5 5s. for the competitor who should most successfully design and execute a glass roundel or disc 9 inches in diameter, painted with any floriated design which the artist-workman might prefer. Five specimens received, also a design, but no prizes awarded.

PRIZES FOR COLOURED DECORATION.

The Committee of the Ecclesiological Society offered, through the Council of the Architectural Museum, a prize of £5 5s. for the competitor who should most successfully colour, according to his own judgment, a cast of one of the "angelic choir" in the north transept of Westminster Abbey. Twenty-two specimens received.

Prizes Awarded.

Prize 1.—£5 5s., and a certificate, to Mr. Joseph Peepole Wood, 25, Brown-street, Bryanston-square.

Prize 2.—Increased from £3 3s. to £4 4s., and a certificate, to Mr. A. O. P. Harrison, 337, Euston-road. (A prizeman on two or three occasions.)

Prize 3.—Added by the Ecclesiological Society, £2 2s., and a book and a certificate, by the Architectural Museum Council, to Mr. C. J. Lea, High-street, Lutterworth.

PRIZES FOR PORTIONS OF THE WHOLE OF WORKS.

The Council of the Architectural Museum offered prizes of £1 1s. and upwards, with certificates in cases specially deserving, for the whole or a portion of any actual work, whether finished or not, in stone, wood, metal, glass, or colour, or for specimens of tracery, flat surface work, or masonry for mouldings, without ornament of any kind, which might be tendered to them, and appear deserving of the reward. Six specimens received under this head. Two specimens, before referred to, sent in other competitions, but not coming within their conditions, were transferred to this competition, and prizes awarded as follows:—

Extra Prize.—A book, to Charles Grassby, Elm-house, Ealing, for stone carving.

Extra Prize.—A book, to E. Dujardin, 7, Richmond-terrace, East-street, Walworth, for wood carving.

SUPPLEMENTARY PRIZES.

Mr. Mac Colla offered, through the Council of the Architectural Museum, two prizes of £5 5s. each for the two best designs for tile pavements; the one suited to a Gothic building, the other for a mansion in the Classic style of architecture.

Eight specimens received for the Gothic pavement. That adjudged to possess the most merit is by Mr. Edmund Sedding, of Penzance, and the £5 5s. offered has been given for this specimen in accordance with Mr. MacColla's wish.

Nineteen specimens were received for the Classic pavement. That adjudged to have most merit is by Miss Mary K. Beecham, of Cirencester; and the prize of £5 5s. has been given in the case of the Gothic pavement competition.

Mr. S. C. HALL, having been called upon by the Chairman, said he had had the great happiness of attending meetings of this Society from its very first formation. He had the pleasure to be present when the Society was originally formed, in the very humble locality entitled the Cockloft, in Cannon-row, Westminster. And he had the pleasure of attending there that night, to witness the very large advance, both in the prosperity of the Institution, and in the progress of the art-workmen who had been competitors for the prizes. He had watched the Institution with the most exceeding gratification, from its beginning to the present moment. He was present at its birth, and he earnestly hoped it might not be his destiny to be present at its death; for he should exceedingly regret any absorption of this great Society by that great Babel in the midst of which they were then standing. For from the day that took place, they might be sure it would be the downfall of the Society, and be the arresting of the progress of doing good to the art-workman, of conferring benefit upon the architect, and promoting the welfare of manufacturers throughout the country—(Hear, hear.) He had little to say about architecture, but he had much to say of the art-workman. The result of the long, sound, and good experience which he had had went to show that the only reason we did not compete with the foreign designer was the lack of knowledge of the art-workman; and this Society was highly calculated to promote the welfare of the art-workman, and thus promote the benefit of the art-manufacturer. He should deplore any incident, any event, that could lessen that great means of usefulness which, up to the present day, this Society had forwarded so largely. He knew that he was addressing a large number of art-workmen, and some of them had had their names heralded to the world as successful competitors for prizes for works of art. And he might state, for their information, that, in the *Art Journal* catalogue of the Great Exhibition he was preparing, he had always made it a study to ask the manufacturers to tell him the names of the artist-artisans, and those names he should publish in every instance where he engraved the work—(Applause.) He thought it right to insist on having the names of the artist-artisans who modelled and executed the works produced by

art-manufacturers—(Applause). He should deeply regret any step of the directors that would absorb their Society in the much larger one held in the building in which they were assembled. He did not think any good could come of it, but he thought much evil would—(Hear, hear). Though for saying so the building might tumble over his head, he believed a worse-managed concern did not exist in England than the Department of Science and Art in which they were assembled—(Hear, hear). Let them take, for example, the atrocious block which the great metropolitan city of London had received for the Great Exhibition—the atrocious embranchment of the earth, called a building of architecture, which surrounded them there, and which emanated wholly and solely from the Department of Science and Art, which had produced art for the art-manufacturers of this country for several years past, not to its service, but to its detriment. As to the building for the Great Exhibition, he thought it the ugliest and the worst he had ever had, and when foreigners came over who would grin when they passed Trafalgar-square, and laugh at the mistaken frescoes in the Houses of Parliament, they would more than grin and laugh when they saw the building for the Great Exhibition, erected by English architects—(Voices, "No, not architects.") Yes, but foreigners would not know what we knew, that no architect was blameable for that abortion—(Cheers.) The foreigner, on coming amongst us, would find this nation the wealthiest people in the world, people of vast judgment and knowledge, at the head of the taste, knowledge, and judgment of any people in the world; he would know that we had ample means for the erection of a proper building for the Exhibition; he would know that guarantees were obtained from the people, to the amount of nearly half-a-million, to secure the payment of the cost of the Exhibition, and he would exclaim what wretched use we had made of all the advantages given us. The foreigner would not know the scandalous job which subjected us to the Exhibition building. When he (Mr. Hall) knew that the superintendent of this Department of Science and Art; the man who had the direction of it all; the man who was nominally the secretary, but in reality the manager of the whole of this concern—

The CHAIRMAN thought it would be rather better not to talk of the managers of this Department.

Mr. HALL.—He did say that "Truth is mighty and it shall prevail," and he did not know why he should not say what was a published fact, that the Directors of the Department of Science and Art cried this building up at the Society of Arts, and said it was a work of Heaven-born art; that the works of Michel Angelo and others were of the same stamp, and that it would be one of the finest and greatest buildings ever erected in this country. That reminded him of the story of the American who fed his horse with deal shavings by putting a pair of green spectacles on his eyes—(Laughter). And the director of the Department said there was no necessity for consulting an architect in reference to the Exhibition building, as they had a gentleman at South Kensington who was better than the whole architects put together—(Hear, hear). If they should be guilty of the mistake of putting the Society of the Architectural Museum under the Department of Science and Art, he (Mr. Hall), who was present at the birth of the Society, should certainly be present at its death. He thought it more necessary to say what he had said as the conductor of an art journal, though it was not an architectural journal; and in his opinion he was bound to speak and write on the subject, because the conductors of the architectural journals would not do anything of the kind, and would not tell the world, broadly and plainly; that the building was a most atrocious abortion, and that it was not the architects of England who were responsible for it. He knew the task was not an agreeable one, but he who shrunk from doing his duty because it was dangerous or disagreeable was worse than a fool, was worse than a rogue, and was a physical and mental coward—(Much cheering).

The Rev. WILLIAM SCOTT, referring to the object of the meeting—the distribution of prizes—said he should speak of what had not been done instead of what had been done. He would remark, however, that the competition in the wood-carving department was exceedingly good, some portions being equal to the school of Grinling Gibbons. He regretted that, in the matter of manipulated ironwork, there were no competitors worthy of the prize offered. It was a matter of surprise that in this country, where metal was a staple manufacture, no candidate, judging from the specimens sent in, even attempted to win the prize. There was no one but must regret the state at which metal-work had arrived when he remembered that the gates at Hampton Court were made in this country. But he knew a common blacksmith at Maidenhead who had executed metal-work of great skill; though, perhaps, not equal to Quintin Matsys, he had produced some works of extraordinary skill and workmanship. He did not intend to follow Mr. Hall in his eloquent denunciation of the Exhibition building, but the existence of such a building showed the necessity of educating art-workmen. He would defy any human being to point out to him one single inch in that building, either in construction, decoration, or idea, or effect, that exhibited the mind or called out the energies of art-workmen—there was no exhibition of intelligence, mind, or skill. He would not deny it was a large work, and reflected some engineering skill on those who designed it; but he would say, that with such a building rising in their immediate neighbourhood, the greater necessity existed for such an institution as the Architectural Museum, the object of which was to educate men's minds, and to call out their higher intelligence.

Mr. G. GILBERT SCOTT, R.A., said he rose to propose what he was quite sure everybody present would most earnestly, and from the bottom of their hearts, respond to. His most agreeable duty was to beg of them to return their hearty thanks to the President for the most able and zealous manner in which he had conducted the proceedings of the evening—(Cheers). He could not help personally thanking the President for the able, studious, and laborious manner in which he had gone through the duties of that evening. The President had had a great excess of subjects on that occasion above ordinary occasions, and it was impossible for them to appreciate too highly the admirable manner in which he had laid those subjects before them. As to the position of the Museum, the Chairman had given lengthened particulars, and Mr. Hall had warned them of some dangers to be apprehended. There were some dangers to be apprehended, but he did not see why those dangers should be realised. The Department of Science and Art had for their special duty the promotion of art in connection with our manufactures, and a more important office could not devolve on any department or society. Their own (the Architectural Museum) department was for the promotion of art in connection with architecture, which was so closely allied with the promotion of art for manufactures; and what was dangerous to one must show that there was something wrong in the mode of management. He believed the Department of Science and Art was doing a great deal for the cause they had in view; and if both institutions were in earnest in their objects he must

LIVERPOOL DOCK WORKS.

HAVING been appointed engineer to the Mersey Dock Estate, Mr. George Forley Lyster has reported to the Works Committee on the present condition and probable time required for the completion of the works.

It appears that the new works on the Liverpool side and adjoining the Canada Dock are nearly completed, the masonry of the two inland carrier docks and tide dock is up and coped, with the exception in the latter of a small portion of the three entrances into the Canada Basin, which, being tide work, necessarily causes a slight but unavoidable delay in their completion. The foundations for the shed about to be erected over the eastern extremity of the South Carrier Dock for the use of the Bridgewater Trustees is in a forward state, being within 15 feet of the coping. The dock gates to the several entrances may be considered finished, and the bridges across the passage to the Carrier Docks are in hand, but nothing has as yet been done towards the construction of the ironwork of the bridge over the 80-foot entrance into the Canada Dock, at which point a considerable amount of work will also have to be done before a "through" communication can be effected. The levelling and paving of the quays generally are rapidly proceeding towards completion, and the docks may be said to be now ready for opening (but incomplete as regards the 80-foot bridge.) A length of 265 feet of foundation wall has been laid in at the south-eastern end of the timber float, but this work has been suspended pending instructions as to the general laying out of the adjoining land. The large sheds on either side of the Huskisson Branch Dock are in a forward state—that on the south being ready all but the slating and doors at the west end; that on the north, however, is much more unfinished, not more than one-half of the brickwork and about one-quarter of the roofing being done.

At Birkenhead the masonry in connection with the Woodside landing stage is in a backward state, not more than 25 lineal yards having been executed, which leaves, according to the present plan, 103 yards yet to be done. The completion of this being dependent on tide work will necessarily be a slow process. One-half of the masonry on which the pontoons of the floating slipway are intended to rest is built, and the remainder will doubtless be ready in time to receive that construction, the contract for which was only let to the Canada Works on the 12th December last, to be delivered in place on the 1st May next. The masonry of the Woodside enclosure may be said to be finished, but a considerable portion of the filling and all the surface forming yet remain to be done.

The works of the Morpeth Dock come next under consideration. Nearly two-thirds, or 420,165 cubic yards, of the excavations are complete, leaving 226,835 yards yet to be done. The greater portion of the masonry of the northern wall is finished, 50 lineal yards being coped, and 250 lineal yards being ready to receive the coping. The quantities of masonry in this dock are as follows:—

Executed to this date.....	16,570 cubic yards
Remaining to be done	42,580 "
Total	59,150 cubic yards

The outer sill of the 85 feet dock, which will connect the Morpeth Basin with the river, is completed, and 120 feet of the north wall carried up to the level of the old dock sill, leaving a gap between it and the river wall of about 40 lineal yards. The quantities of masonry here are as follows:—

Executed to this date.....	5,370 cubic yards
Remaining to be done, including alteration to present entrances	65,466 "
Total	70,836 cubic yards

Of the River Wall, South Reserve work, 333 lineal yards are ready for coping, and 73 lineal yards are carried up to the level of the old dock sill.

Masonry executed	28,586 cubic yards
Probable quantity yet to be done	9,560 "
Total	38,146 cubic yards

The next, and, perhaps, the most important, point considered in the report is that of the low-water basin, as not only involving the important novelty of the scheme, but also including constructive difficulties of no ordinary kind. The foundations around its site are of the most treacherous character, being clay overlaid by a wet and flowing sand, which, when bored into, "spouts up" in a perfectly fluid state, the rock being at such a depth as to preclude the possibility of reaching it with solid foundations; and, were it possible to have done so, the danger of tapping the quicksand would appear to be so formidable as to have rendered such a course highly dangerous. The foundations, therefore, must have been a source of grave anxiety, and every precaution necessary to secure the safety of the work seems to have been adopted. The 50-foot entrances, the sluices, and large feeding tunnels which lead from the great float, are built upon a forest of piles, and a similar course has been adopted wherever an indication of weakness has appeared in the substratum; yet, with all these costly but necessary precautions, slight settlements have here and there occurred in the walls, due to such enormous weights being laid on a bed of compressible material such as are described. There is little doubt, however, but that these sinkings (which are all vertical) will cease after the weight has fairly taken its bearings; but in order to provide against the possibility of any disarrangements in the wall, a solid "toe" of masonry, in conjunction with piling of a most substantial character, has been laid. The masonry of the lock, main tunnels, and sluices may be considered in general terms as finished. The sluice gates and the inner gates of the lock are fixed in position, and the side walls are ready for coping.

The north wall, for its entire length of 1,461 feet, with the exception of a gap of 129 feet, which still severs it from the river wall, is complete and ready for coping. The masonry in the gap is being proceeded with, but it will be some time before this is finished, as there is a very large mass of stuff to be first removed. The masonry on the south side of the basin is for the most part complete, there being a length of 345 lineal yards, which includes the recess for the floating bridge, brought up to its full height and ready for coping. A further length of 25 lineal yards of foundations is laid in to the height of eight feet below the old dock sill, but between the point where this terminates and the river wall there is a formidable gap of heavy work 132 yards in length yet remaining to be done. The foundations between these points are of the worst possible character, and frequent interruptions are occasioned by the breaking out of fresh-water springs from the substratum of quicksand (before described) which seems to overlie the entire surface of the rock. To deal with these springs, as well as the enormous amount of leakage involved by the wetness of the bottom generally along the site, it has been found necessary to sink another well for pumping pur-

poses; this is now in a forward state, and when the engine is fairly at work it is considered that it will effectually keep down the water. Another impediment to the work in this position is the large bank of stuff which lies right in the fairway of the wall, and which must necessarily be removed before the foundations can be got at. The outer or eastern portion of this wall, round the curve which connects it with the river wall, and consequently outside the protecting dam, is of necessity done by tide work, and the level to which the excavation has to be carried being 26 feet 6 inches below the old dock sill, it is only at fortnightly intervals, and then only for an hour or two, that the work can be proceeded with. These impediments, combined with the necessity of the foundations being all piled and carried up in a most careful manner, will doubtless make this otherwise short length a tedious and lengthy operation.

The completion of the coffer dam for excluding the tide, for the purpose of enabling the contractor to complete his excavations, is mainly dependent on the masonry adjoining the river wall against which it will abut, so that until this is done a large portion of the excavations must remain untouched.

The quantities in this portion of the works are as follows:—

Masonry executed.....	163,173 cubic yards
Do., probable amount yet to be done	15,000 "
Total	178,173 "
Excavations done.....	815,729 "
Do., probable amount yet to be done	171,000 "
Total	984,728 "

Between Low-water Basin and Northern Entrances of the river wall, north reserve, 66 lineal yards are ready for coping, and 23 lineal yards are carried up above the old dock sill.

Masonry executed.....	8,552 cubic yards
Do., probable amount yet to be done	6,958 "
Total	15,510 "

The surplus excavations for the two westernmost graving docks have been taken out. There remains about 90,000 cubic yards yet to excavate, a quantity which will be required to make up the ground behind the masonry. In the 50-foot graving dock the sills are complete, and the gates ready for putting together, the side walls for a length of 15 yards inside; the hollow quoins are ready for coping, 15 lineal yards of the dock bottom are built, and a further length of 39 lineal yards concreted, and the masonry over the same progressing. In the 85-foot graving dock the cuissin sill is complete, the side walls up to the hollow quoins ready for coping, and a further length of 15 yards concreted, and the masonry progressing over the same. Railways are laid for supplying stone, &c., and a mortar mill is in course of construction, having been commenced on the 10th of December last.

A summary of the foregoing report will show that in round numbers there are 500,000 cubic yards masonry, 1,212,630 cubic yards excavation, and 282,574 superficial yards paving, remaining to be done; 24 pairs of gates, and two caissons to be built.

Correspondence.

PAROCHIAL ASSESSMENTS.

SIR,—The Bill to amend the law relating to Parochial Assessments in England, prepared and brought into the House of Commons in this present Session by Mr. Clive, Sir George Grey, and Mr. Villiers, proposes by the 3rd Clause:—

"That every rate to be hereafter made for the relief of the poor shall be made upon the full rateable value of the hereditaments liable to be rated, such rateable value being ascertained by an estimate of the yearly rent which a tenant would pay for the same on a lease for a term of seven years, the lessee bearing all the usual tenant's rates and taxes and tithe commutation rent-charge, if any, and the lessor undertaking to provide the probable annual cost of the repairs, insurance, and such other expenses as may be necessary to maintain the hereditaments in their actual state."

Allow me to endeavour to point out the unfairness of this standard of rateable value:—
B holds land of A at an annual rental of £40; C holds a house of him at £40; D holds a house of him at £40; each tenant pays rates, taxes, and tithes, but does not repair or insure; the landlord A has to do what is necessary to maintain the property in its actual state; B's land costs A nothing; therefore the annual value is still £40. C's house, being comparatively new, requires an average annual outlay of only 10 per cent.; the net annual income is, therefore, £36. D's being a very old house costs on an average of seven years 25 per cent., leaving only a net annual income of £30. By the proposed Bill the annual rateable value of each property will be £40. Surely the fair thing would be to assess the properties at £40, £36, and £30 respectively.

THE ROYAL ENGINEERS.

SIR,—There is nothing so like the thing as the thing itself; no counsel needs to rack his brain seeking to prove a prisoner guilty, when a plea to that effect is put in by the culprit himself; by the same rule, no charge of incompetency made against the corps of Royal Engineers will have so much weight as a confession by one of themselves; that they are not only guilty of what has been urged against them, but to a much greater extent, so much so as to be beyond redemption. The power impelling such an *exposé* as the article in the *United Service Magazine* for January last, must be some other than penitence. I cannot conceive that any other terms will give so clear a clue to it as those I mentioned in my previous letter—"despair, ignorance, and malevolence."

The writer of the article was, no doubt, perplexed for a time as to how he should reconcile his brother officers to such admissions and accusations as he felt it impossible to avoid, in asking for a new lease of sincerity; he must also have felt very much relieved from that perplexity when the idea of vilifying the civil officers occurred to him, than which nothing is more palatable to the majority of the officers of the corps, it being a commodity in which they have at all times dealt rather freely, but more liberally still since the agitation for putting them in their proper positions has attained such proportions as to make it unpleasant for those whose interests are jeopardized.

Upon the present anomalous positions of both civil and military officers I need say little, as I can only repeat what has been so fully urged in your columns and elsewhere, by none more fully than the writer of the article I am alluding to; but when I come to the system he proposes, and look at it in a practical and professional manner, with some little regard to the cost of introducing and working it, I am struck with amazement; I can hardly believe that I am not dreaming, because I cannot realise to myself the state of mind of a person who would have the effrontery to venture on an absurdity so monstrous and so opposed to common sense as to propose to carry out the works and buildings required under the War Department, by engineer officers and sappers, by daywork.

I will premise that no amount of training or drilling will ever cause military officers' except in the rarest cases, to give that attention to the studies and practice necessary to

qualify them for holding the civil appointments, and performing the civil duties of the Royal Engineer Department. They regard at all times too much their military position: they are too much infatuated with the "officer and gentleman" notion, and in consequence treat with contempt their "civilian aspirants," and invariably act as if they believed it would be a lowering of their dignity to acquaint themselves with any of the details of a profession, with which they would not be troubled even in name, were it not that thereby they draw from the Exchequer not only the cost of a great part of their education and of their maintenance whilst being educated, but also the value of their commissions, and the pay and allowances which follow. This is one view, I will take another.

Is it reasonable to expect that all military officers of the corps of Engineers are capable of acquiring the information necessary for the civil appointments, supposing them to be willing to learn? Have they not, as military studies, what is next to impossible for them to know, and what very few of them master? On this point I would refer your readers to a blue book published in 1857. "A Report of the Commissioners appointed to consider the best mode of re-organising the system for training Officers for the Scientific Corps," where they will find that I do not in the least exaggerate when I say, if officers were to become qualified as military engineers, they would have no time to spare from their military studies, their minds would be almost bewildered with their military profession; unfortunately, however, for the country, they have prostituted the good name and duties of the corps until it has become almost a reproach, and they are now neither military engineers, nor capable of performing civil duties, but an incubus, from which it would be an act of charity to relieve the tax-payers, who, in addition to legitimate and necessary taxation, are also taxed for what is in reality, as far as "giving money's worth for the money they receive," but little better than a corps of "National Pappers."

All engineer officers dread, as do "burnt children the fire," any allusion to what they as officers cost, as also to the possibility of private enterprise and means producing more satisfactory results than do Government establishments; they in a specious and plausible, and to the uninitiated, in a very satisfactory manner, make up a case for engineer officers receiving their education at the public expense. I can see no reason why the country should pay, as it now does, about £500 for a youth of from "eighteen to twenty years of age," who is then launched out "with little learnt, and that soon forgot," when the whole of the universities, colleges, and other large educational establishments would, if necessary, make military engineering, under competent professors, one of the branches taught, and from whence, free of expense, by public competition, could be procured all the necessary number of officers, and, without a doubt, much more qualified. What stimulus is there to exertion for the youths who, when once they join Chatham, know that they are safe? that, happen what will, short of a military crime, their nest is feathered; this feeling, engendered too at the most critical period of life, when characters are yet undeveloped, and when, should the inclinations and tendencies be for an inactive and leave-to-others-to-do-the-work sort of life, no after reprimands will rectify or prevent. "The youth is the fore-shadowing of the man."

Great stress has at all times been laid by engineer officers upon the necessity of employing them upon "all Government works of every nature, both at home and abroad, such as docks, breakwaters, drainage, surveying, &c.," and a "Lieut.-Colonel Simmons, C.B., R.E.," in the blue book I previously mentioned, has the coolness to say, after urging the foregoing plea—"The objection ordinarily made to this practice by the civil profession, that it would be taking the bread in many cases out of their mouths, ought not to be listened to, for surely the country, after going to the enormous expense of educating and maintaining a number of professional men, have an undoubted right to the employment of their professional services." He also considers "that much benefit would accrue to the public service if officers were assisted in travelling to visit public works, both civil and military, at home and abroad" (the article in *Colburn's* has a similar idea, almost word for word). Without a doubt Lieut.-Colonel Simmons, when at Constantinople, felt that travelling would probably afford him an opportunity of acquiring what would enable him to hold a civil professional appointment in the Royal Engineer Department, and perform the duties thereof as well as do his brother officers; for, if I mistake not, he has for the last fifteen years or more been engaged on duties with which that department is not at all concerned. He was for many years an inspector of railways at the Board of Trade, where, perhaps, he had occasion to peruse the opinion of Sir Charles Pasley "that the Britannia-bridge would fall of its own weight." He was also employed on a military duty in North America, also in Turkey, and for some years was Consul-General at Warsaw, from whence a few months since he was removed to the Camp at Aldershot. The only result, however, the country would obtain from engineer officers being sent to inspect civil works and buildings would be that in addition to paying the enormous expense of educating and maintaining them, it would be called upon to pay for their enjoyment and amusement; for what benefit could possibly arise from sending a person to inspect something of which he knew but little and cared less. It would be almost as reasonable to expect to make artists of house painters, simply because they had been paid for gazing on some splendid oil painting, in happy ignorance of either its beauties or merits. The Government exercises a wise discretion in refusing to adopt such clap-net; they, as the guardians and distributors of the revenue of the nation, as well as the public who contribute towards it, are awakening to a conviction that although up to this time engineer officers have had a "pretty deep dip into the bag," it is now quite time that the question be asked, "what evidence of efficiency can be produced as a return for 'the enormous expenditure in educating and maintaining them' that has been incurred, and as a reason for continuing them in their present position and to their present numbers?"

A revolution in the corps, a fresh batch of officers from top to bottom, would be necessary to impart fresh confidence in their abilities to perform the duties of the appointments now held by them, any former confidence being shaken to its very foundations by the disclosures, accusations, and admissions, so frequent of late; and some stronger proof of ability and requirements than has ever yet been displayed before the nation would allow of such an enormous job being perpetrated, as to hand over all the works and buildings under the War Department, building, or to be built, to the corps of Royal Engineers. If it were not for the ruinous outlay that would be caused by the introduction of such a system, the strongest opposers of it could wish for nothing better. Every practical or professional man, knowing the working of the corps, and the abilities for civil duties of either officers or men, could foretell that any such system would be followed by overwhelming and irretrievable failure as that night follows day.

Before leaving the officers I should like to estimate as near as I can what the officer part of the *Colburn's* scheme would cost to put it in working order. Without very tedious and elaborate calculations it would be impossible to show what it would cost for working when ready.

The cost of an engineer to the country up to the time of joining Chatham for education and maintenance, quarters, salaries of professors, &c., &c., is not less than £300; for two years at Chatham, including pay, quarters, professors, &c., at £200 per annum, £400. For providing extra accommodation for extra number, including establishment at Chatham, and at the academy, museums, model rooms, lecture halls, churches, schools, exercising grounds, materials for practice, new professors, &c., &c., £300 each, or, in even figures, £1,000 as a total, which for the 114 officers amounts to £114,000.

There are now in the corps (see article) 382 officers. Taking 32 as the number who are too old to be taught, there would remain 350 who would have to go to Chatham for one year to qualify them for the new system. Their pay and allowances would be considerably more than that of young lieutenants. I will take it at £350, as an average, or, for the 350, £117,500. This, with the cost of the new officers, makes a total of £231,500; and when this amount is expended, it will be comparatively thrown away, because, as far as architects, civil engineers, and surveyors are concerned, it will only be "creatures of a year as compared with those of a month, and in either case ridiculous;" whereas they could be procured free of expense to the country, and withal competent and qualified. Any improvement in military engineering knowledge is not to be expected, as the extra period at Chatham is not for extra military education. And even if it were, as a writer in the *Army and Navy Gazette* last week says—"Civil engineers, after some military training, need never be afraid of meeting an equal number of Royal Engineer officers." I see also, in last month's *Colburn's* one or two notices of military engineering failures. I see that at Spitham a civil engineer is engaged to put in the foundations of a fort; and, therefore, taking a broad view of the matter, it is a question, seeing, in addition to the foregoing, that the requirements now brought into the army at large by officers are perhaps equal, if not superior, to those of officers of the Royal Engineers—there is any necessity for a separate corps for military

engineering, whether it would not be politic to do away with the present corps, and institute in its stead some means whereby the necessary engineering knowledge can be diffused throughout the whole army; the civil duties being entrusted to those who are competent, whether the present civil officers, or architects, surveyors and civil engineers from outside, for whose education the country will not be taxed, and in whose works will be visible something more in accordance with "the age in which we live" than now meets our eyes as productions of the Royal Engineers. Forts would be built without assistance from outside, and if monumental arches are required, they would be forthcoming, without applying to others to design and erect; and if another Exhibition building should be required, when foreigners came to visit it they would go back to their own country without being uncertain whether they had seen two magnified dragons' helmets, or, as the editor of the *Civil Service Gazette* called them, "Metal Dish-covers, misnamed Domes."

I have drifted into a much longer letter than I intended on the officer part of the scheme; the remainder will be disposed of in less space on another occasion, if you will be kind enough to insert this in the *BUILDING NEWS*, which I am almost ashamed to ask you to do, and would not if the subject did not require all the ventilation possible.

PETARD.

TENDERS FOR THE LUNATIC ASYLUM, KENT.

SIR,—The tenders for the lunatic asylum, at Stone, Kent, for the Corporation of the City of London, recorded in your last number, afford an illustration of the different estimates assumed by builders for the respective values of Ancaster and Portland stone. The greatest difference is 7-7 and the lowest 1-2 per cent., the average of sixteen tenders being 3-6.

I am inclined to think that there is a mistake in one of the tenders, and that the extra value of Portland over Ancaster may be assumed to have raised the total value of the work at an average of 3 per cent.

T. W. G.

14, King William-street, Strand, W.C.

TESTIMONIAL TO MR. HAYWOOD, CITY SURVEYOR.

AT the first meeting of the Commissioners of Sewers, in their new court, it was unanimously resolved that a purse containing one hundred guineas be presented to the engineer and surveyor, Mr. William Haywood. Mr. Haywood, in thanking the court, expressed his gratitude for their kind mark of approbation, and said the manner in which it had been given was extremely flattering, and, as long as he was in their service, he would do his best to deserve their approbation.

TENDERS.

BANK, OCNILE.

For building a bank at Oundle, for the Stamford, Spalding, and Boston Banking Company. Mr. W. Eve, architect. Quantities not supplied.
Thompson and Ruddle.....£1,985 Meath (accepted).....£1,390 0
Cesford.....1,590 Storer and Wright.....1,323 14
Boddington.....1,535

DWELLING HOUSE, STREATHAM.

For a new house at Streatham. Mr. R. W. Drew, M.A., architect. Quantities supplied by Mr. James Alfred Bunker.
Gannon.....£2,340 Turner and Sons.....£1,859
Downs.....2,322 Deacon.....1,840
Bartlett.....2,085 Trellope and Sons (accepted).....1,834

DEVONPORT, STONEHOUSE, AND CORNWALL HOSPITAL.

For the erection of this hospital, on a site granted by the War Department, at the head of New Pillage-hill. Quantities supplied to Messrs. Jenkin and Co. by Messrs. Arding and Bend, surveyors, of Bedford-row, London.
J. W. Sawyer.....£3,953 Adams and Son.....£3,689
Willcocks.....9,487 Matcham.....8,548
Lethbridge.....9,437 W. Harvey.....8,000
Simons and Hoskin.....9,220 Perkins and Co.....7,950
Clark.....8,990 Cull and Pellrick.....7,594
Hutbard Brothers.....8,700 Finch.....7,555
Elliett.....8,691 Jenkin and Co. (accepted).....6,900
These tenders do not include the cost of gas and water supply, or for stoves, boilers, and grates.

GENERAL WORKS, FOR METROPOLITAN BOARD OF WORKS.

Western Division of the Metropolis.—The tender of Mr. E. Thirst, of John-street, Chelsea, for three years, has been accepted, at 12½ per cent. under the prices enumerated in the schedules.

Eastern Division.—The tender of Mr. W. Dethick, of Great Cambridge-street, Hackney-road, for three years, at 12½ per cent. under schedule prices, has been accepted.

Southern Districts.—The tender of Messrs. Hill, Keddell, and Robinson, of White-chapel-road, for three years, at 12½ per cent. under schedule prices, has been accepted.

WAREHOUSE, LONDON.

For partially rebuilding a warehouse, No. 23, Aldermanbury, for Francis Broughton, Esq. Mr. F. G. Widdows, architect. Quantities supplied.
Green and Son.....£2,309 Brass.....£1,940
Child, Son, and Martin.....2,039 Ennor.....1,931
Axford.....1,998 Browne and Robinson.....1,865
Ashby and Sons.....1,979 Ashby and Horner.....1,864

STABLES, ESSEX.

For the erection of coach-house and stables, at Buckhurst-hill, Essex. Mr. J. H. Rowley, architect, 17, St. Helen's-place, City.
Dyer.....£275 Outhwaite (accepted).....£219
Rivett.....223

VILLA, UXBRIDGE.

For the erection of a villa residence, at Uxbridge, for E. Hedgcock, Esq. Mr. Robert W. Edis, architect, 53, Lincoln's-inn-fields.
Simpson.....£1,800 0 0 Morten.....£1,633 0 0
Spurgeon.....1,712 10 0 Hardiman and Sanden.....1,587 0 0
Shoppee and Son.....1,710 0 0 Parsbridge and Son.....1,515 0 0

ALTERATIONS, &c., LONDON.

For alterations and repairs, at No. 177, Ratcliff-highway. Mr. F. G. Widdows, architect.
Whelan.....£154 Williams.....£117
Smith.....147 Ennor.....114

THE OLD ALMSHOUSES OF THE DRAPERS' COMPANY.—Messrs. Pullen and Co. have sold by auction several houses, situated in Crutched Friars, and which were built in the reign of Henry VIII. They were erected in the year 1535, by Sir John Milbourne, Knt. (a wealthy member of the company), for about twenty old and infirm inmates, who were liberally supported by funds bequeathed for that purpose. The houses are still in a very solid state, and have been visited by many antiquaries. They will be forthwith pulled down, and the site appropriated to the erection of chambers. New almshouses have been erected by the company at Tottenham for their decayed members.

COMPETITIONS OPEN.

INFIRMARY.

LONDON.—The managers of the Central London District School desire to have designs for a detached infirmary for their boys' and girls' schools at Cuckoo Farm, Hanwell. The building must be of a simple and inexpensive character, in harmony with the existing buildings, and comprise accommodation as required by the Poor Law Board for 180 boys and 180 girls, each sex to be separately distributed in six rooms. There must also be a kitchen, surgery, waiting-room, and other necessary offices underneath. Particulars on application to the superintendent at the schools. The plans must be drawn to a uniform scale of 8 feet to an inch, each to be accompanied by a specification of the works and an estimate of their cost. No premium will be given, but the architect whose plan is chosen will be paid by commission for supervision, &c., of erection of the building in the usual way. Each set of plans must be subscribed with a motto, and forwarded with a sealed letter, containing the motto and the author's name, to Samuel Heath, Jun. clerk to the Board, No. 10, Basinghall-street, E.C., on or before April 2.

LAYING OUT.

TRAFFORD.—The directors of the Trafford Freehold Land Society desire plans, before the 25th March, for laying out and allotting the estate belonging to the Society, in Higher Trafford; consisting of about 40 statute acres. Premiums will be given for the best and second-best plans. Each plan to be accompanied with an estimate of the cost of the formation and construction of the roads and sewers, and also of the laying out of the land. Particulars from Mr. John Quinn, Chairman of the Society, 22, Lord-street, Liverpool; or from Mr. H. P. Priest, Secretary, Market-cross-chambers, 19, Market-street, Birkenhead.

COMPETITIONS AWARDED.

The committee for the erection of the proposed new Congregational chapel and schools, at Plymouth, have selected the design marked "Utile Dulci," submitted by Messrs. Paul and Ayliffe, of Burley under whose superintendence the works are to be carried out forthwith. The second premium has been awarded to Mr. Tarring, of London. Thirty-six designs were sent in.

CONTRACTS OPEN.

MECHANICS' INSTITUTE.

DUDLEY.—For the erection of a new mechanics' institute and public hall, at Wolverhampton-street, Dudley, in the county of Worcester. Plans, &c., at the office of Mr. William Bourne, architect, Tower-street, Dudley, to the 17th March. Sealed tenders, endorsed, "Tenders for Mechanics' Institute at Dudley," are to be forwarded to Joseph Stokes, solicitor, Wolverhampton-street, Dudley, Honorary Secretary, on or before the March 20.

BANK.

IRELAND.—For erecting a branch bank and manager's residence at Nenagh, co. Tipperary, for the Provincial Bank of Ireland. Plans, &c., at the office of the architect, W. G. Murray, 68, Lower Gardiner-street, Dublin, up to the 31st inst. on which day estimates are to be forwarded addressed to Thomas Hewat, Esq., Provincial Bank of Ireland, 42, Old Broad-street, London, E.C.

INFIRMARY.

LYMINGTON.—For the erection of a fever ward upon part of the workhouse premises in Lymington. A plan of the work, with specifications, at the office of Messrs. Colborne and Son, surveyors, Lymington. Sealed tenders to the Clerk to the Guardians at his office, in Lymington, on or before March 22.

PRESTON.—For the erection of the whole or any portion of a new church, to be built at Preston. Plans, &c., at the Upper School-room, Wellfield-road, Preston, and also at the office of the architect, Mr. E. G. Paley, Lancaster, to 18th March, inclusive. Tenders to be sent in under cover to the Rev. Thomas Clark, West Cliff-terrace, Preston, endorsed "Tender for St. Mark's Church," on or before March 22.

CHAPELS.

BRISTOL.—For the erection of the Clifton Wesleyan Chapel. Drawings, &c., with Fosters and Wood, architects, 6, Park-street, Bristol, till the 28th inst., on or before which the tenders are to be sent to the architects, sealed and endorsed "Tenders for Clifton Wesleyan Chapel."

OLDHAM.—For the erection of a Wesleyan Chapel, at Shaw, near Oldham. Plans, &c., at the vestry of the Wesleyan Chapel, at Shaw, until March 22.

SCHOOL.

SURREY.—For the infant school and house proposed to be built at Farncombe, near Godalming, Surrey. Plans, &c., at the Farncombe National Schools. Tenders to be sent to C. H. Howell, architect, 6, Crescent, New Bridge-street, London, before the 24th March.

PARSONAGE.

DEVON.—For the erection of a parsonage house in the parish of Shute. Plans, &c., at the Beagles Inn, Shute. Tenders to the Rev. J. Binford Sellwood, the Ridge, Honiton.

VILLAS.

DORCHESTER.—For the erection of a villa and offices, at Dorchester. Quantities, with forms of tender (price 21s. returnable) from Mr. Eales, architect, 9, Welbeck-street-west, London, to whom tenders before March 22.

CAMBRIDGE.—For the erection of a dwelling-house or villa, to be built in March, in Cambridgeshire. Plans, &c., at Mr. Edgar Foster's, at March. Tenders to Mr. Foster, on or before the 31st March.

DWELLING HOUSES.

TWICKENHAM.—For building eight small houses at Twickenham. Drawings, &c., at the office of the architect, Henry McCalla, C.E., 25, Westbourne-place, Eaton-square, to whom tenders by 12 noon March 24.

DUMFRIES.—For building a dwelling-house and offices, at Heads, in Lochruton. Plan, &c., at Heads. Tenders to W. Beattie, Esq., Newton, on or before March 26.

PETERBOROUGH.—For building a house, opposite the Corn Exchange, in Peterborough. Plans, &c., at the Phoenix Brewery. Tenders to be sent in on or before the 18th inst.

HANTS.—For the alterations and works required to be done to the dwelling-house and offices on the Sherwoods Estate, West Green, in the parish of Hartley Wintney, Hants. Plans, &c., with Messrs. Haslam and Buckland, surveyors, &c., 23, Friar-street, Reading; or at the dwelling house, West Green. Tenders to be delivered at 23, Friar-street, before the 22nd inst.

HANTS.—For the erection of a dwelling-house and offices, at Little Arnwood, in the parish of Hordle, Hants. Plans, &c., with Messrs. Haslam and Buckland, surveyors, 23, Friar-street, Reading, Berks; or at the Farm-house. Tenders to be delivered at 23, Friar-street, Reading, on or before March 27.

BRIDGE.

LEICESTER.—For the formation and construction of the abutments and retaining wing and parapet walls, piers, &c., for the intended new Bow-bridge. Drawings, &c., with E. L. Stephens, borough surveyor, Local Board of Health Office, Silver-street, Leicester. Tenders are to be delivered to him by the 19th inst., endorsed "Tenders for Abutments, &c., Bow-bridge," and addressed to the "Chairman of the Highway and Sewerage Committee."

WORKHOUSE.

GREENWICH.—For the erection of apartments for twelve aged married couples, at the Union Workhouse, Woolwich-road, Greenwich. Plans, &c., at the Union Workhouse. Tenders sealed and addressed to the Guardians of the Greenwich Union, marked "Tender for Buildings," to be delivered before two p.m., on 20th March.

POLICE-STATION.

DEVON.—For the erection of police station, &c., at Northtawton, Devon. Plans, &c., with Henry Ford, Clerk of the Peace, Castle of Exeter, and at the office of Robert Fulford, Esq., clerk to the Justices, Northtawton. Sealed tenders endorsed, "Tender for Northtawton Police Station," to be sent to Mr. Ford on or before the 1st April.

MILITARY WORKS.

SCOTLAND.—For contracting from 1st April, 1862, to 31st March, 1865, inclusive, for the performance of such artificers' work as may be required at the under-mentioned stations, viz.:—Edinburgh Castle; Piershill Barracks; Leith Fort, Martello Tower, and Blackness Castle; Greenlaw Military Prison and Barracks; Perth Barracks; Dundee Barracks and Broughty Castle; Dunbar Barracks; Berwick and Holy Island; Glasgow Barracks; Dumbarton Castle; Paisley Barracks; Hamilton Barracks; Ayr Barracks; Fort Matilda; Stirling Castle; Aberdeen Barracks, Beach and Torry Point Batteries; Forts George, Angus, and William. In all cases, the seven trades are to be in one tender for each station, and the contracts to be determinable at any period after the first year, on either party giving to the other three months' notice in writing. Any person may tender for one or more of the above stations. Parties applying for forms of tender must give sufficient guarantee to the entire satisfaction of the commanding royal engineer of their being fully competent to undertake and execute any new works or repairs that may from time to time be ordered on the contract schedules. Every information on application to the Royal Engineer or Barrack offices, at the several stations herein named, together with printed schedules of the prices, with the terms of contract and letter of tender for the several descriptions of artificers' work, to the 27th February, upon making a deposit of five shillings for the same. The letter of tender to be sealed, and transmitted under cover to the Director of Contracts, War Department, Pall-mall, London, S.W., so that it may be received on or before the 10th March, 1862, and to be marked on the left-hand corner of the envelope, "Tender for Works at ———."

GUERNSEY, &c.—For the usual triennial contracts for works and repairs to War Department Buildings in the Islands of Guernsey and Alderney. Schedules of prices and forms of tender (for which 6s. 3d. for each set will have to be deposited), and all other information may be had on application to the surveyor, at the office of the Inspector-General of Fortifications, War-office, Pall-mall, London, S.W.; and at the Royal Engineer Offices in Guernsey and Alderney. Tenders will be received by the "Director of Contracts," War-office, Pall-mall, London, S.W., on or before the 20th March.

NORTHERN DISTRICT.—For the performance of such of the under-mentioned descriptions of work as may be required at Whitehaven and Maryport, in the construction of gun-platforms, parapet walls, magazine and artillery store, inclosure fence, &c. (in the batteries for drill and practice about to be formed there); in the partial levelling and draining of the sites for the batteries; and in the formation of roads. Schedules of prices and printed forms of tender until the 19th of March, at the Royal Engineer Office, Newcastle-on-Tyne, where plans and specifications of the works may at the same time be seen. Each contractor will be required to tender for all of the trades:—Masons', paviors', bricklayers', and plasterers' work; carpenters' work, slaters' work, smiths' and ironfounders' work, plumbers' work, painters' and glaziers' work. Each tender to be properly filled up and signed, and transmitted under cover to the Director of Contracts, War Office, Pall-mall, London, S.W., on or before the 25th March, and marked on the outside, "Tender for Works at ———," in the Northern Royal Engineer District.

PORTSMOUTH DISTRICT.—For the several works and repairs to the fortifications, barracks, and other buildings required by the War Department at the places undermentioned, upon a contract for three years, from the 1st of April. Intending contractors may be furnished, by payment of 7s. 6d. with the printed schedules of prices and the conditions of the contract, with every necessary information respecting the same, on application at the Royal Engineer Office, Portsmouth, until the 18th of March. Stations for which separate tenders will be received:—Portsmouth.—Including Portsea Island and South sea Castle, with 5 per cent. allowed for Lumps and Bastein Batteries, Fort Cumberland, Hilsa, and Tipner, and 10 per cent. for works on Portsmouth Hill. Gosport.—Including Forton, Priddy's Hard, Haslar, Forts Monckton and Blockhouse, with 5 per cent. allowed for Ports Brockhurst, Rowner, Elson, Gomer, and Grange, Stokes Bay Lines, Brown-down, and Gilkicker batteries; and 10 per cent. for Forts Wallington and Fareham. Isle of Wight.—Albany barracks and East Cowes, with 10 per cent. allowed for each of the other stations on the island. Southampton.—(Pensioner's Establishment) with 5 per cent. allowed for Marchwood, and 10 per cent. each for Hnrst and Calshot Castles. Winchester, Chichester, Christchurch, Trowbridge, Littlehampton. One contractor only will be accepted for the whole of the trades for each of the above-named stations, but the rates of per-centage at which the parties tender may be different for each trade, at their option, but such rates must be shown in the proper place on each of the schedules. The tenders will be required to be delivered before twelve noon, on 22nd March, at the War Office, Pall-mall, London, addressed to "The Director of Contracts," and endorsed "Tender for Artificers' Work, Portsmouth District," in the left-hand corner of the envelope.

SEWERAGE, &c.

DUMFRIES.—For constructing and completing a main sewer and its appurtenances, in the White Sands, Dumfries. The sewer will be about 500 yards in length, and to be built of bricks with fire-clay invert blocks. The section, &c., with James Darbous, C.E., Buccleuch-street, Dumfries; and tenders to be lodged with William Martin, town clerk, on or before 20th March.

WARRINGTON.—For the laying of sewers with their appurtenances in the following streets, in Warrington, viz.:—Bold-street, Egypt-street, Suzet-street, Palmira-square, Crown-street, Newton-street, Orford-street, Naylor-street, James-street, and the streets adjacent thereto. Drawings, &c., with Mr. B. P. Coxon, C.E., borough surveyor. Tenders endorsed "Sewerage Contract No. 17," addressed to the Chairman of the Paving and Sewerage Committee, are to be left at the Town-hall not later than six p.m. on the 17th inst.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

11. M. T. F.—As soon as the remainder can be completed; now very shortly.

12. & R. P.—E.—Thanks; oblige us with the architect's name.

13. T. B. (Biggleswaite).—Looking to the tone of your letter, we are only disposed to say that the course notified will be carried out. Politeness costs nothing.

C. W. (Ireland).—Try to obtain an introduction to the architects concerned in such matters. There is no other chance of succeeding.

J. B. (Alnwick Castle).—Send order to our publisher, who will supply back numbers.

E. A. H. (Liverpool).—Thanks; shall appear.

B. B. (Ipswich).—Will be ready shortly.

G. C. H.—Three and three-quarters per cent. on the amount of contract is the usual charge for such services; but on small works, such as yours, a higher rate might be fairly charged.

J. S. M.—Should entrust the work to an architect.

W. H. R. H.—Thanks for sketch; shall be engraved.

C. K. M.—We cannot say.

S. E. (York).—Below our mark.

A. F.—Yes; if suitable. We cannot promise.

J. H. L.—Refer to our fourth and last volumes.

T. L. C. K.—Declined with thanks.

O. E.—Proof shall be sent if wished.

Y. B.—E.—We cannot decide wagers.

E. R. P.—Shall hear from us.

D. I.—Communication has not been received.

W. J. (Yarmouth).—Yes.

G. S.—Send name and address for our private information.

H. B. H.—Letter has been forwarded.

G. W.—Too late.

F. L. F. (Carlisle).—Next week.

A. W.—Very shortly we hope.

** All communications to be addressed, The Editor of the BUILDING NEWS, 20, Dowell-court, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 18 to 21, Old Bowell-court. Advertisements are received up to six o'clock on Thursdays.

CONCENTRATION OF THE LAW COURTS.

IMPRUDENT as it may be to predicate what erratic course will be taken in the House of Peers under the obstructive influence of ex-Lord Chancellors—great lawyers *en disponibilité*—we venture to anticipate a complete and proximate triumph for the measures which the Hon. Mr. Cowper introduced to the House of Commons last Friday night. For the wisdom and urgency of concentrating the Courts of Law and their offices in one locality become more patent day by day, and the question has in consequence been narrowed to two issues, which admit of easy debate and early settlement.

They are, the application of money at the disposal of the Court of Chancery, which none can claim, and the choice between the centre of Lincoln's-inn-fields and the area between Carey-street, Strand, Bell-yard, and Clement's-lane, for the site of the concentrated courts.

It may be that in the House of Lords the personal convenience of the Master of the Rolls will be used as an argument against concentration and in favour of dispersion. In that case the convenience of thousands of counsel and attorneys, the economy of time and money of suitors for justice, will be held as nothing in comparison to the convenience of Sir John Romilly and of some half-dozen of his officers. The Master of the Rolls is also the Keeper of the Records. He combines with the administration of justice the custody of public documents. Let us endeavour to explain his position to the better understanding of the motives for his advocacy of dispersion, and, so far as his court is concerned, of its seclusion and separation from other courts.

Independently of his judicial business, the Master of the Rolls has had, within the last few years, a large addition to his record business. To his care are committed, besides the Rolls—properly so called—the records of the State Paper Office, and of various departments of Government, such as the Admiralty, the Audit Commissioners, the War Office, &c. Moreover, Sir John Romilly has undertaken the care and superintendence of the publication of chronicles and calendars—a work of the highest historical and national importance, which has given him well-founded claims upon the gratitude of the public—more particularly of that section which is interested in historical and literary studies. The duties of Sir John Romilly, as Keeper of the Records, are not very onerous, though they may be felt as burdensome when added to his judicial duties. He says they take an hour a day, or six hours a week; that a great portion of it is done by two or three words of direction; a letter has to be opened and answered in conformity with two or three words of direction; in various other cases his signature is all that is required: and that a great deal is merely formal, with a little addition of direction. At present the Record Office and Rolls Court are in the same building. By going down to his court a quarter of an hour or twenty minutes before it meets, by taking ten minutes from his luncheon time, remaining half an hour after the court is up, and employing the odd half-hours when he has to wait for counsel, the Master of the Rolls gets through a great amount of record business, assisted chiefly by the facility he has of sending for his subordinates, who are in different parts of the building. Were his court to be concentrated with other courts in a Palace of Justice, as proposed, he could not transact his record business in these odd bits of time, but would be obliged to devote to it a considerable portion of his vacation. This would be a very sad thing to do; and, however great might be the saving of time and money to the profession and to thousands of suitors by including the Rolls Court in the concentration scheme, no one desires it should be done at the expense of the vacation amusements of Sir John Romilly. Rather perish the project, let justice be delayed and rendered unnecessarily costly to generations of suitors, before the Master of the Rolls should be compelled to curtail

his vacation rambles a day. Are not individual enjoyments to be preferred to the satisfaction of an empire's requirements?

But may not the problem be solved, to the delight of all parties, by separating the office of Master of the Rolls from that of Keeper of the Records? From Sir John Romilly's candid confession it would appear that the separation of the two offices may be easily effected. The Master of the Rolls is a judge, not always, as in the present case, possessed of literary acquirements and taste. What knowledge he has of the subject "he has usually acquired *after* he is made Master of the Rolls; no doubt the person he principally relies upon is the Deputy Keeper"—very much as if Nelson had commenced to study seamanship after he had hoisted his pennant, or as if the Duke of Wellington had commenced to learn battalion drill after he had received his marshal's bâton. The Deputy Keeper of the Rolls declared it to be absolutely necessary for the Master of the Rolls to possess a great knowledge of the history of this country and of the history of Europe generally, and that there is no special reason why the two offices should be combined. We have seen that the business of the Keeper of the Records is mere formality and routine, with, perhaps, the occasional exercise of discretion. But the keepership of the national records, every one must feel, would have been an office which Lord Macaulay would have filled, and Earl Stanhope would fill, with peculiar fitness and eminent advantage to the public. It is true that the present office is filled without cost to the public, but it may be questioned if that is wise economy.

We do not desire to hold up France as an example to copy in this respect, but there can be no harm in learning how she preserves her national records. The budget for the present year provides £7,260 for the custody of the Archives Imperiales, including a Director-General, at £600 a year, with twenty-seven subordinate *employés* and servants, and £600 for works, fac-similes of Carolingian documents, casts of seals, purchase of portfolios, binding, and publication of calendars. Supposing the separation were effected, there need be no additional cost to the nation, except the salary—perhaps £1,000 a year—of the Lord Keeper of the National Records. At all events, if it were done, there would be an end to the opposition of Sir John Romilly to the concentration of the law courts—which it would be cheap to buy off at larger prices—and he would have no cause to fear encroachments on his vacation amusements.

There remains but two grounds to be examined—the propriety of appropriating two funds, amounting to £1,400,000, at the disposal of the Court of Chancery, and the merits of the two sites proposed.

With respect to the fund, as that was made the *cheval de bataille* of the obstructionists last session, we may be permitted to recapitulate the facts of the case, in order that they may be distinct and prominent to the reader's mind. There are at present two funds vested in the Chancery Accountant-General—the surplus Interest Fund of £1,290,000, and the surplus Suitors' Fee Fund of £200,000—which have accrued from investments, made by order of the Court, of moneys paid into it which were the subjects of suits. It would be a repetition of what has appeared in previous numbers to explain how the fund has accumulated. All that is necessary for present purposes is to know that it is the surplus of unappropriated fees in days gone by; that "former suitors were not entitled to it; and that it does not belong to suitors at the present moment." Were the fund applied as proposed, the maximum charge that could be thrown on public taxes would be £35,000; but it by no means follows that this sum will ever have to be borne by the Exchequer, seeing that last year the Exchequer received £34,000 surplus Court fees. On the other hand, the saving that would result from the concentration scheme being carried out by capitalising the rents saved and the value of sites would be £500,000; so that the useful application of "nobody's money," instead of allowing it to be idle, like the talents of the slothful servant, will quicken and cheapen the administration of justice, relieve the national exchequer from no inconsiderable burden, and effect a great moral, social, sanitary, and architectural improvement in the metropolis.

Of the two sites proposed for the Concentrated Courts of Law, it has been sought by the *Times* to obtain a decision in favour of the centre of Lincoln's-inn-fields over Carey-street, on the ground that it will cost nothing, whereas the Carey-street site will cost some £600,000. There never was a greater misapprehension, and if we can show that Lincoln's-inn-fields, as compared with Carey-street, will cost as much, and, perhaps, more, in the long run, we are justified in claiming the verdict in favour of the latter. On this point there is no better authority than Mr. Harvey Gem, the deputed representative of the freeholders of Lincoln's-inn-fields to offer the gardens as a site on certain conditions. Now these conditions, upon the fulfilment of which the site would be given inside the gardens, will entail an enormous outlay. For they required the construction of a thoroughfare direct from Holborn to the Strand, a continuation of Serle-street into the Strand, the formation of a great central thoroughfare running into Carey-street, and additional new streets into the Fields from Holborn and from the west. There was to be provided also a

new system of sewerage. Mr. Harvey Gem estimated before the Select Committee of last year that the Holborn and Strand thoroughfare, the continuation of Serle-street, the opening of Gate-street, and the widening of Little Queen-street, would cost £408,000, and with accessories rise to between £500,000 and £600,000. As for the cost of fulfilling the other conditions—the central thoroughfare and sewerage—that would be quite independent. It is, therefore, the same thing as if Mr. Harvey Gem and the freeholders asked upwards of half a million for 3½ acres in the midst of Lincoln's-inn-fields; and they officially declared that they would not consent to Parliament occupying the site unless this compensation were made. But this is not all; the area that would be conceded in the centre of the enclosure in return for this outlay would do no more than accommodate the Courts. The law offices would have to be left scattered about as they now are, or be built on a site purchased.

Mr. Harvey Gem—and in referring to him we do so for the sake of convenience, he being the organ of the advocates of the site—proposed to the Select Committee that the Courts should be put in the centre of the gardens—"then you may take the sides for your future legal structures, and make it the grand centre and square of the law." The ground for the depository of wills—one acre and a half—he said, should be on one side of the square, and another whole side of the square should be occupied with legal offices, while some court accommodation should be provided in Lincoln's-inn. For this purpose it would be necessary to purchase the houses on the north, west, and south sides—in fact, to purchase the property of those gentlemen who pretend to present the nation with a site for the Courts of Justice. Thus we have, first of all, a positive outlay of £600,000—there can be no error in taking the larger sum named—to make approaches; and the prices of the three sides of the square, which may amount, for aught the public has in the shape of security to the contrary, to any unknown quantity—to another half million, while the principle of concentration, for which all this outlay is to be incurred, will be violated by having the courts within the enclosure, the offices on the sides and in the inn—a makeshift which will involve an outlay for the purchase of sites to which no one can fix a limit.

On the other hand the Strand site, as it is distinctively called, and in favour of which the late Commission reported, will cost £678,044 from first to last, and that will be in some measure reduced by the reletting of frontages, and the proceeds of sales from old building materials. There can, consequently, be no question which is the cheapest, and, considering the requirements which both sites will have to satisfy, we are quite within the mark in saying that the acceptance of the site in Lincoln's-inn-fields as a present from the freeholders will entail an outlay upon the nation of twice the cost of the Strand site. Despite the adage about not looking a gift horse in the mouth, it is very needful to do so in the present case. Indeed, Mr. Harvey Gem frankly admitted the extra cost of the presented site over the purchased site, and sought to excuse it because "we should not look merely to cheapness; we should ascertain which is the best plan for the Courts, the public, and honour of the law, and the honour and convenience of the metropolis, and then see if it cannot be carried out. I do not think the public would grudge money well laid out for those purposes." It may be that a few lawyers entertain the delusion that expensiveness conduces to the honour of the law; but the public will most certainly grudge the unnecessary expenditure of half a million of money merely to procure honour for the law.

When we come to consider the accommodation of the respective areas, it is difficult to understand how any one can for a moment entertain the proposition of employing Lincoln's-inn-fields. The utmost that will be given is 3½ acres—as we have seen, quite inadequate to the requirements of the occasion. The Strand site contains 7½ acres, or more than double that area, and will not absolutely require the construction of new approaches; it is desirable they should be made when so admirable an opportunity occurs, not so much to afford access to the Courts as to supply new channels for traffic, especially one going north and south, and the widening of the Strand by removing Holywell-street. Mr. Abrahams, who was examined before the Select Committee that sat last year, and whose experience as an architect in the purchase of property and erection of buildings in London extends over a period of forty years, stated that he knew of no property equal in extent which can be so cheaply purchased. It is singularly economical from the fact that it is not only quadrangular in form, but it is also nearly equilateral and of great depth taken from north to south, so that there will be only one line of goodwill with a large mass of inexpensive property to be taken. In no part of London can an area of such extent be bought without some serious impediment from existing factories or public buildings.

The advantages that would result to society, public health, and morality, and to the architectural appearance of the metropolis, came out strongly in evidence. The sanitary character of the site is very bad, though less than it would be were it not mitigated by currents of fresh air brought up by the tides. Yet "it is almost impossible to re-

main for any length of time in some parts, the stench is so dreadful. The condition of the people is terrible; the vice and wretchedness in the young, the decrepitude in those of middle age, and the dreadful condition of those in premature old age, are appalling." Few of the inhabitants are workpeople, in the general acceptance of the term; they are costermongers, washerwomen, and sweeps—"in fact, the most extraordinary combination of the most unfortunate characters in the metropolis." During his survey Mr. Abrahams was attacked, and had a very narrow escape of being robbed near Plough-court. Shire-lane is the most infamous locality in London, and contains some of the worst houses; almost every one is more or less badly occupied. The courts and alleys which cover the site are built in contradiction of all modern legislation on the subject of buildings, since they have no through drafts. They are *culs-de-sac* of the worst possible description, and have no system of drainage. If these characters are expelled from the locality, they will go somewhere else; but, as Mr. Abrahams remarked with great truth and force, they would not be able to congregate as they do now in this neighbourhood; they would be diffused through society, and would not have the same bad effect when separated as they have when in combination. Vice reacts from one individual to another, and intensifies; the moral corruption increases proportionately to the density of the population.

With these facts before the public it is to be hoped that the delusions which led to a preference being given to the centre of Lincoln's-inn-fields for the site of the law courts will be dispelled, and that the unanimous recommendation of the Commission, as well as of the Select Committee, will be accepted.

"THE END OF A FRAY FITS A DULL FIGHTER."

MR. HALL, the conductor of the *Art Journal*, has recently snatched an opportunity, and relieved his overburdened mind of its congested discontents. At the ordinary meeting to distribute the prizes of the Architectural Museum, reported in our last issue, Mr. Hall found an audience assembled, and, being primed by the letter of "an Architect," published in the current number of the *Journal*, must needs deliver a volley, "in King Cambyzes' vein," in the very stronghold of the enemy. The Department of Science and Art, its officers, and all appertaining to it or them, were peppered with his anger. But the full force of his denunciation was reserved for their Gargantuan creation, which is now being fed with all the best things of the world. His reason for being so pot-valiant was, that the "architectural journals had been silent" on the subject; so, with a fresh wound in the dead Hotspur's thigh, he "looks to be either earl or duke I can assure you." We should have thought that the very fact of the Architectural Museum holding its meetings, by courtesy, at South Kensington, would have spared them such an attack within their own walls, and the meeting from such an unexpected and unbecoming exhibition. There was plenty of scope for a "fluent orator" in the business for which the audience was especially assembled. The chairman attempted to call Mr. Hall back from his wandering flight, but to no purpose. He again broke—

"Into the woman's mood,
Tying his ear to no tongue but his own."

He rolled his heavy sentences, and would fain have had his hearers believe that Zeus spake. The "boilers," however, did not collapse; Mr. Cole was not carbonised; and Captain Fowke subsequently took his customary gallop without dread of any consequent mishap to the gigantic shed. "A plague on all cowards; is there no virtue extant?" said Sir John Falstaff; and Mr. Hall paraphrased the well-known exclamation in his outspoken peroration. If the use of pointed weapons constitutes a warrior, Mr. Hall should kneel, to rise again Sir Samuel. He bristled with them like the fretful porcupine. It is true his opponents were not in sight to awe him into propriety, and that he had not so disposed of them as to account for their absence. This, perhaps, made his courage conspicuous, even as the red coat of the soldier stands prominently out amidst a crowd of soberly-clad gentlemen. In their presence he, perchance, might have "roared as gently as a sucking dove."

We have no inclination to defend the objects of Mr. Hall's attack; they are perhaps indefensible; but we maintain that the meeting was neither the time nor place to make it, and we are indisposed to accept Mr. Hall's self-appointed championship of architecture. Some good reason had to be furnished why he, above all others, should so singularly parade himself. He gave "the silence of the architectural journals." Even if we had been silent—which we deny—his display would have been as useless as it was, under the circumstances, unwarranted. Whilst the Exhibition was being hatched, Mr. Hall might have perceived who sat brooding on the nest. It is vain to bestir himself now, when the monster is beyond his reach. The Architectural Museum was not thrust forth to make space for the ungainly creation. It has gained strength, size, and vigour at South Kensington, and common gratitude might reasonably have been expected from a promoter and guardian of it, in a meeting which testified to its vitality. Mr. Beresford Hope, we have no doubt, admires the building as little as Mr. Hall or we do, but he had the good taste to be silent on the subject when speaking at South Kensington.

ton to the meeting over which he presided. Periodically, like all other journals, we have noticed the Exhibition building; we have found fault with it where we deemed it defective; we have not hesitated to praise any portion which we considered fairly deserved approval. We battled against the appointment of a military engineer upon a building which foreigners might consider a mark of architectural progress. We published the opinions of the presidents of the Architectural Societies, but, spite of our and their opinions, the building was erected. We certainly did not think it necessary to drag personalities into the contest, or to impregnate every article we wrote with our dislike to the Exhibition building. Our contemporary, the *Builder*, has acted in a somewhat similar spirit. We may be guilty of "moral and mental cowardice," because we cannot "take it upon our death that we gave him that wound in the thigh." We must, however, have other proof of our tame submission than Mr. Hall's recent irascible eruptions, which, to say the most of them, appear so late in the day that even his opponents can afford to smile silently at his own mention of his prowess.

We will not flutter Mr. Hall so much as to say that if he had taken part with us at the beginning of the fray our defeat would have been more glorious, but he might, in such case, have learnt to qualify his present language. It would have caused him to refrain from firing in to his friends in consequence of the insensibility of his enemies to his onslaught. He would, moreover, have known that a continuous carping at a building which was a settled fact would have laid us open to the charge of professional jealousy and disappointment, and that brave words were wasted when the contract was signed, and Messrs. Kelk and Lucas' staff were in possession of the ground. The professional journals would certainly not be enriched by Mr. Hall's sanction of their proceedings, and they are consequently but little affected by his censure. We are only sorry that he considers it becoming to leave his editorial chair and proclaim his individuality, and that he, in so doing, tends to bring discredit upon a profession which neither requires nor accepts his ill-timed advocacy.

Mr. Hall, in his journal, has done good service to the arts as well as to the publishers. We have recognised it with pleasure, but we think he showed neither wisdom nor prudence when he left his sphere of hidden usefulness to seek a little popularity. The *Art Journal* has ever been one of the main stimulants to International Exhibitions, and to the promotion of art-manufactures. The scheme which it ably and persistently supported may, perchance, have been carried by other hands far beyond him. They have met rewards; Felix Summerly has become a Companion of the Bath; Mr. Wentworth Dilke will leave a title to his posterity; other fellow workers of former days have been more or less dignified, but Mr. Hall has only been honoured with permission to engrave the Queen's pictures. It is not unlikely, therefore, that a little mortified vanity and nipped ambition may be at the root of his opposition to the present officers of the Department of Science and Art. We do not affirm such to be the case, but his actions engender the suspicion. It cannot be in sheer wantonness that the gentle zephyr of Spring has become now a rude angry Boreas.

The *Art Journal* recently announced its intention to devote more consideration than it had heretofore shown to architecture. There was certainly a gap to be filled up in a journal which professed to represent the arts. It begins in no amiable fashion, plunging pell-mell into friends and foes alike. If this be a sample of its consideration we could well be rid of it, and think it might, with greater satisfaction to its readers, pursue its journeys "up the Hudson," and leave English architecture and architects to be defended by those who can do so with becoming knowledge, dignity, and prudence.

THE ALBERT MEMORIAL.

LAST Friday the Design Committee held another conference in the Council-chamber of the Fine Arts Commission at the Palace of Westminster. Mr. Marshall, the chairman of the Ross of Mull Granite Company, attended and gave additional information respecting the block of red granite, about 106 feet in length, and some 12 feet square on an average, which had been discovered in an unleased quarry there belonging to the Duke of Argyll, and to which the attention of the committee had been previously directed as suitable for the intended memorial. He produced a diagram of the stone and plans prepared by Captain Moorsom, the company's engineer, showing its position and outline, and that it is about 500 yards distant from the sea. He explained that it had been uncovered to the extent of about 106 feet, and that as both its ends are still embedded, it may be found to be of even a greater available length than that mentioned.

The committee have also received communications from the owners and lessees of other granite quarries in the kingdom, especially one from Lord Palmouth, who has made an offer in the event of his quarries of serpentine being found to contain a single stone of sufficient dimensions. It is understood that the Duke of Argyll has intimated to the committee his desire to present them with the stone to which reference has been made on his property in the Island of Mull. The Granite Company, who lease some of the adjacent quarries to that in which it lies, have given in two estimates—one of £25,000 as the probable cost of quarrying the stone, shaping and polishing it on the spot, and removing it to the water's edge; the other of £15,000 for those operations, less the polishing, which in that case would be done in London. Mr. Marshall calculated that the interval required for the operations covered by the first estimate would extend from the present time to the summer of 1863.

SURVEY OF SCOTLAND.—A Parliamentary return gives the following account of money voted and expended on the survey of Scotland during the three years mentioned:—1858-9, voted, £32,000, expended £32,770 13s. 9d.; 1859-60, voted £32,000, expended £31,830 1s. 11d.; 1860-61, voted £30,500, expended £25,069 14s. 2d.; 1861-2, voted £22,000, expended £22,000.

THE DICTIONARY OF ARCHITECTURE.

IT is very much to be regretted that architects do not, one and all, step forward, and by an annual subscription of one guinea each to the funds of the Architectural Publication Society, secure the speedy completion of the Society's "Dictionary of Architecture," than which, perhaps, no one can point out a more valuable acquisition to architectural literature. Apart from the work now in course of publication, it must be remembered that we really have no modern comprehensive dictionary of architecture in the English language, and there certainly cannot be an architect in practice who does not feel the want of a reliable authority to which he may turn at need. Such a work, when completed, will be the "Dictionary of Architecture." Not compiled and published, it must be remembered, with any idea of pecuniary gain. The whole of the funds collected are absorbed by, and simply present themselves in another form in, its pages, while the Committee work hard and *con amore* to maintain that character of authority and completeness which, doubtless, it was at first felt that the work should possess. And yet, not overlooking, however, the indefatigable perseverance and labours of the honorary secretary, Mr. Wyatt Papworth, there can be no doubt that the profession has behaved very cordily with regard to the Dictionary. We have now before us, as just issued, Part No. 1 for the year 1860. As we understand it, this is from no fault of the Committee. It arises simply from the fact that the amount of matter issued depends on the amount received by way of subscriptions. No doubt when the work was commenced many held back, waiting to see it and to judge for themselves if they would subscribe or not. Time soon passes onward, and now those who, seeing the high value of the book, may wish to subscribe and take up the early parts, find that it involves an expenditure of some ten or eleven guineas, there is a little more hesitation and "thinking about it," and another year's publication is soon added to the list. Really, this difficulty is worth the careful consideration of the Committee—indeed of the Society—for at the present rate of progress those who wrote under letter A can hardly hope to contribute under Z. Bearing in mind how desirable it is that such a work should be completed as speedily as may be consistent with its present accuracy and comprehensiveness. Would it not be expedient to offer some facilities to new subscribers for the completion of the sets? A reduced price for early parts seems the most obvious course, and we cannot think that the old subscribers would object to allow this advantage to new comers if they hoped by it to secure double the number of subscribers, and the consequent completion of the work in less than half the time it will otherwise take. We are quite certain, and so, no doubt, are the Committee, that if the difficulty as to the back parts could be surmounted, a large accession of subscribers would follow. The work is now well known; we ourselves have taken occasion more than once to urge its claims to the support of the profession, and never did so more earnestly than we now do, after an attentive examination of the part before us.

As examples of the manner in which the subjects are treated, we transfer to our pages portions of the articles "Fixture" and "Foundation." The part comprises, in the letter F, "Felin" to "Fynol."

FIXTURE.

This term is frequently used to signify articles of a personal nature which have been affixed to land, whether removable or not; and sometimes expressly to denote articles which are not by law removable when once attached to the freehold: but the term, in its correct legal sense, signifies such things of a personal nature as have been annexed to the realty, and which may be afterwards severed or removed by the party who annexed them, or his personal representatives, against the will of the owner of the freehold. When the article is not so removable, it is, to all intents and purposes, part of the freehold, and subject to the rules and incidents of real property. An "ordynance of the Cite (of London, 1365-6) for Tenaunty of Houses what thingis they shall not remove at theyr departinge," is given in Arnold's "Chronicle," 4to., London, 1811, p. 137.

The principle involved in the question as to what is *prima facie* a landlord's and what is a tenant's fixture, may be briefly stated thus, viz., what is necessary for tenable occupation belongs to the landlord, what is desirable for simply personal and individual convenience belongs to the tenant; with the increase, therefore, of luxury and comfort, the range of what are considered landlord's fixtures is constantly increased, and that of the tenant's decreased; thus, originally glass windows were *prima facie* tenant's fixtures, now stoves and bells are *prima facie* landlord's fixtures.

Fixtures are of two kinds.—1. Trade fixtures, those articles which a tenant fixes for the purposes of his trade or business. 2. Domestic fixtures, those which he fixes for domestic comfort or convenience, or for purposes of ornament. As regards the first branch, the law seems to hold that fixtures can only be removed when they are part of the trade rather than of the land, and may be carried away as more appropriate to the former than to the latter. Thus a nursery-man may remove his greenhouses, hothouses, &c., and a soap-boiler his vats and coppers; and thus a steam-engine to work a colliery, a mill to make cider, sheds to manufacture bricks and tiles, are all held to be removable, though clearly affixed to the freehold. The law seems to regard them as the tools or implements necessary to a man to carry on his trade, and as things which he could remove to and use in another spot. But such things as are put up by a tenant as a means of improving the use of land rather than that of purposes of trade, are not removable. Thus, though a tenant may take away a cider mill (3 Atk., 13), he cannot remove a beast-house, tool-house, waggon-house, &c. (Elwes and Mawe, 3 East., 38.) Gardeners, &c., may remove shrubs, &c., planted for the purposes of sale, but not to pull up plants which will entail malicious injury to the reversioner, with little or no good to themselves. Gibbons (p. 31) has summed up the matter with a well-known legal maxim: "It is only permitted to remove such things because necessary for their trade, and *cessant ratiō cessat ipso iure*."

With regard to the second class, domestic fixtures, the incidents appear to be these:—1. They must be fixed to be freehold, not slightly, like carpets nailed to a floor, or mirrors fastened up by screws, but so fixed to the house as to be part thereof. 2. That they have been so fixed by the tenant. 3. That they be useful in the occupation of the house, or ornamental thereto. And 4. That they are

capable of being removed without any substantial injury to the house. As these are questions of fact, scarcely two cases may be said to be alike, and the rights of the parties must be left to be decided more as regards the contract of agreement between landlord and tenant (either expressed or implied), and the equity of the transaction, than on dry legal maxims.

FOUNDATION.

For the purposes of classification, the various descriptions of strata available for the foundations of a wall may be described as follows:—1st. solid rock; 2nd. Incompressible but movable strata, such as sand or gravel, when free from water; 3rd. the same strata when charged with water; 4th. clays or loams in their various states; 5th. compressible strata, such as alluvial muds, peaty lands, or running sands, chalk footings.

1st. Solid rock should be made, as nearly as possible, level throughout. If there should be any great irregularities in the natural surface, compensation may be made for them by the use of concrete, of solid rough masonry, or of brickwork; it being always borne in mind that all these materials are, for a time, liable to compression under an instant load. A rock may be considered to have sufficient power of resistance when it bears a weight of 100 lbs. per foot superficial, without exhibiting any signs of compression. The upper and more weather-worn beds of the limestones, sandstones, shales, schists, and sometimes even of the granite rocks, are too much fissured to allow of their being trusted as foundations, without the introduction of some mode of distributing the weight over a large area; and they, therefore, require to be treated in the same manner as the strata next to be noticed. But the solid beds of any of those formations may, without hesitation, be used as foundations without any intermediate works.

2nd. Strata, such as gravel or sand, free from water, and sensibly horizontal to a considerable distance from the extreme edge of the building proposed to be erected upon them, are, for all practical purposes, as incompressible as rock itself; but as the small particles of which they are composed are free to move under unevenly distributed weights, it is almost always desirable to introduce between the footings and the gravel a bed of concrete, or some analogous means of effecting the desired object of distributing the weight over a large area. If the gravel and sand, however, should be prevented from spreading laterally, there can be no objection to founding an ordinary building at once upon them; but in such cases it is essential to inquire beforehand whether there be any probability of a change at any future period in the condition of the strata.—CONCRETE.

3rd. When the gravel and sand are charged with water, it is absolutely necessary to resort to some artificial method of forming the foundations. With gravels there is less danger from displacement of the materials themselves than with sands of a fine and even character; because the latter act the same as dense fluids, and yield to the pressure of any body of a greater specific gravity than themselves, if there should be any means provided for their escape laterally.

When a building has to be founded upon fine sands charged with water, the first operation to insure the stability of the work is to surround the intended site by an enclosure, composed either of whole or of sheet piles, or of iron sheet piles, in such a manner as to isolate that portion of the stratum from the surrounding sands. This enclosure must be carried down to the solid substratum under the watery sands, so as to prevent the latter from slipping away under the outer edges; and great precautions must be taken to prevent the enclosure from bursting under the action of the load. If these objects can be effected (and there would be no difficulty in so doing, unless the sands were of considerable thickness), the whole of the enclosed surface may be rendered fit to receive the building by being covered with a uniform bed of concrete when the weight of the building is not very great, or the portions of the surface immediately under the seats of the walls to be erected may be adapted to receive the latter by the use of piles supporting a wooden or a stone platform, upon which the lower courses of the masonry are laid.

In the cases of lock gates, foundations for the piers of bridges, or analogous works, it is customary to drive piles all over the surface (an operation which, if carefully performed by driving them, beginning from the exterior and working towards the centre, tends to consolidate the foundations by compressing the ground itself); and at times it may even be desirable to act in the same manner with other buildings, as dock warehouses, &c.; for ordinary civil constructions, however, it will suffice to pile simply under the walls.—PILE AND PILING.

4th. Clays and loams in their native state are, for all practical purposes, incompressible, and a building may be erected upon them without the interposition of concrete or of any artificial foundation, so long as the clays and loams are prevented from spreading or moving laterally, and provided their natural surfaces have been attained. The danger to be apprehended from clay subsoils is in the fact that beds of sand are often intercalated between the principal beds of clay, and if, under such circumstances, the edges of the sands should be laid bare at a lower level, and water should get into them, they would be likely to slip under the action of a heavy weight. Beds of clay near the surface sometimes become dry in unusual seasons of drought, and in buildings constructed without reference to their condition serious settlements invariably follow. Upon a hill side it becomes necessary to carry the foundations upon a clay or loam to such a depth as to prevent any lateral displacement of the upper beds. At present it often happens that unnecessary expense is incurred in the execution of concrete foundations on sands, loams, and clays, in flat horizontal plans, where, in fact, all that is absolutely necessary is to carry the walling through any vegetable soil or made earth to the undisturbed ground, and to prevent water from penetrating between the bottom of the walling and the seat upon which it rests. Even the Oxford and London blue clays, if occurring in a plain, would be found incompressible under a load of 50 lbs. to the foot superficial, but they have occasionally been known to slip when their surfaces have formed an angle of 1 in 10 to the horizontal line, so that it would be advisable in the erection of a building of any importance to consider the line of stability of these strata to be at least 1 in 12, and to carry down the foundations accordingly, even when they are dry.

If the clays and loams should, however, be covered with water flowing over their surfaces, the source of that water should at once be intercepted by any of the processes adopted for dealing with subterranean watercourses. It is desirable in all cases of building on wet clay to surround the footings by close piling, and to intercept the passage of water beneath their surface, and, at any rate, to insure the uniform and equal compression of the subsoil immediately under the footings by isolating it from that surrounding it. If, by reason of any local circumstances, there should flow over the top of a bed of clay or loam a spring so powerful as not to be susceptible of being diverted, the foundations must be supported upon piles, or cylinders must be employed.

5th. Compressible strata, such as peat, alluvial lands, sands intercalated with

peaty beds, and running sands, are the most difficult to be rendered fit to serve as foundations. If it should be possible to form round the position intended to be occupied a water-tight enclosure or a coffer-dam, it would certainly be advisable to throw out the whole of the materials so enclosed, and to carry the foundation down to the solid substratum. But it frequently happens that the thickness of the class of strata thus described is so great that the expense of making a coffer-dam could not be incurred; in this case piles or cylinders must be used, according to the importance of the building, especially if the compressible strata under consideration should be liable to move laterally. Instances exist in which the soft alluvial muds are so thick that it is impossible to reach their supporting strata by any of the ordinary processes; thus, in the case of one of the new railway bridges upon the Loire, it was found impossible to reach a solid bottom even by the use of piles scarped together so as to form a length of about 120 feet. At L'Orient, again, the semi-fluid mud is of such an indefinite depth that no piles can reach the bottom. The method adopted in both these cases has been to surround the intended position by a close piled sheeting, and then to stud the enclosed space by numerous piles, in such a manner as to compress the mud itself as far as possible. The descent of the piles is, under these circumstances, simply resisted by the friction upon their sides; and at L'Orient, another element of resistance was obtained by driving the piles with the butt end downwards. All such foundations must, however skilfully executed, be considered to be unsatisfactory, and they must constantly be liable to subsidence and to lateral displacement. The most important precautions to be taken with them are, 1st, to insure a permanently tight enclosure; 2nd, to insure a firm even platform all over the enclosed surface, by use of timber and of concrete; and 3rd, to insure the distribution of the superincumbent weight over the whole surface of the platform, by the use of wide footings and of inverts. Sir R. Smirke executed successfully some foundations on the soft alluvial mud of the Thames, by the use of an exceedingly thick bed of concrete; but in these instances the mud was so confined by some ancient river walls, as not to be able to spread laterally.

On peaty subsoils, the principal danger arises from the unequal compression to which they may be, or become, exposed; for if a building were erected upon a platform resting upon peat, and the weight of the building were evenly distributed over its surface, it would, in all probability, subside evenly until it had attained the degree of compression required to resist the load. But if a greater load than that of the building were subsequently to be laid on the peat by the side of the original load, the peat would be compressed under the new effort, possibly to such an extent as to overthrow the first building. In fact, if some means of carrying the wall of a building down to the solid substratum beneath a peat bed be not resorted to, or the space between the footings and the solid substratum be not filled up with concrete, it is indispensably necessary that the whole of the seating of the building should be isolated from the surrounding ground by means of close sheet piling, so as to prevent any lateral movement.

In the case of foundations upon running sands, there is no choice left to the architect beyond that of piles or of cylinders, to be subsequently filled in with concrete. In both cases great precautions must be taken to insure the connection between the artificial foundations and the resisting substrata, and to protect them from any tendency to lateral displacement by cross-bracing, if possible, or by upper platforms. The load of a building must, in fact, never be brought upon a running sand, however it may be temporarily enclosed; and the artificial foundations used must not be exposed to turn upon their edges under the action of any movement in the sands themselves.—COMPRESSION; CYLINDER; PILING-IN.

The introduction of Mitchell's screw piles has greatly facilitated the execution of foundations in certain uniformly resisting strata.

SOCIETY OF ANTIQUARIES.

A Tameeting of the Society of Antiquaries, held on the 6th inst., Earl STANHOPE, President, in the chair, Mr. Cornelius Nicholson and Mr. G. S. Butler were elected Fellows of the Society.

Mr. W. H. HART exhibited and presented four ancient documents: a deed concerning the Manor of Stapleford, Essex, temp. Edward IV.; two rental rolls of Kettleberston and Tittenhanger Manors, respectively; and a parchment volume of the nature of those referred to in printed collections as "Ancient Statutes," temp. Edward I.

Mr. BERAH BOTFIELD, M.P., presented a photograph of some pottery found at Wroxeter, and a "Plan of the Roman Defences of Uriconium."

In connection with this plan some remarks by Dr. Johnson, together with some other illustrations, were communicated to the Society through Mr. J. H. PARKER.

Mr. FRANKS, Director, exhibited some specimens of Mediæval jugs, and made some remarks on the slab of Maude de Gournay.

Mr. CORNELIUS NICHOLSON communicated an account of Brougham Castle.

METROPOLITAN BOARD OF WORKS.

AT the usual weekly meeting of this body, held on Friday last, J. THWAITES, Esq., the Chairman, presiding, the Works and Improvements Committee recommended that the Board contribute one-third of the cost of effecting a public improvement in Throgmorton-street, to be carried out by the Commissioners of Sewers of the City of London, by setting back the house, No. 39, in that street, as shown upon the plan produced to the Committee, estimated at £916, exclusive of professional charges; such contribution not to exceed £305 6s. 8d., and that such amount be paid to the Commissioners of Sewers of the City of London, on a certificate from the architect of this Board of the completion of the work.—Agreed to. That the Board do contribute one-half of the cost of effecting a public improvement in High-street, Kensington, to be carried out by the Vestry of Kensington, by widening the same as shown on the plan produced to the Committee, estimated at £500, such contribution not to exceed £250; and that such amount be paid to the Vestry of Kensington on a certificate from the architect of this Board of the completion of the work.—Agreed to.

THE ROYAL SCOTTISH ACADEMY.—The first *conversazione* of the season was given by the president and members of the Royal Scottish Academy on the 12th inst., in the National Gallery at Edinburgh. The proceedings were attended with marked success. In the course of the evening Professor Blackie delivered a lecture on "The Acropolis of Athens, the Erechtheum, and the Parthenon."

THE ALBERT OBELISK.

WHEN it was sought by well-meaning philanthropists to divert the large and still-flowing tribute of a nation's gratitude to its Prince into innumerable petty channels, where, by wide spreading, it would have dissolved to naught, the Queen deprived even disappointment of its customary pang by the tender expression of her wish, and strengthened by her wise decision the position of those who desired to avoid making the Prince Consort's monument a socially remunerative memorial. In deciding, however, in favour of an erection of a purely monumental character, and in mentioning an obelisk as the form most likely to meet with public approval, Her Majesty made an express provision that it "should be on a scale of sufficient grandeur." The Committee since then appointed by the Queen to determine the several details, have necessarily first directed their attention to the materials for the central feature of their work. That the British Islands possessed granite quarries from which monoliths might be cut equal in size to any which were ever reared was never doubted, although the absence of any standing block had somewhat obscured the fact. The Committee's investigations have now again made it manifest; whether we desire red granite or grey we can have it, but the gigantic cost which a successful rivalry of ancient Egypt and modern Rome must of necessity entail, looms up in gigantic proportions commensurate with the work, and threatens to defeat our object. The owners of the several quarries meet the Committee with characteristic liberality, but their generous offers as regards the mere material lessens but in a trifling degree the total cost. There is no doubt that in the nineteenth century, with scientific appliances and engineering skill, we can do with marvellous facility what our painted ancestors were able to do without such assistance on Salisbury Plain, but the question arises whether it be wise to waste our powers only to excite the lowest feeling which can be excited in the minds of spectators. In the absence of capacity for making better impressions, the men of old barbarous times excited the simple wonder of the people. By an extravagant expenditure of muscle they made up for their deficiency of mind; it should, however, be remembered that a head painted by Raffaele, or carved by Donatello, is worth, in point of art, fifty Stonehenges; that one sculptured metope from Minerva's Temple, weighed in an intellectual scale, makes even the Sphinx kick the beam. We should like the Albert Memorial to be an intellectual rather than a muscular monument—to kindle something beyond the vulgar sentiment of wonder.

In directing attention to this especial feature, we emphatically repudiate any thought of questioning the wisdom of the Queen's decision. The stipulation with which it was accompanied, and the invitation for remarks on the subject from the Select Committee, justify our course and clear it from anything approaching an objective colour.

Immediately that her Majesty settled upon an obelisk people ran away with the idea that it must necessarily be monolithic. This necessity we take the liberty of questioning. It would, of course, in that case possess a certain value on account of its rarity, as all things do, from a stuffed gorilla to the Koh-i-noor, but for its intended purpose it would have no additional value at all commensurate with the cost. The expense of transporting the huge block would alone absorb more than the total amount of the subscription now raised. To guide us in this estimate we have but one example to refer to—that of the obelisk of Luxor, now in the Place de la Concorde, at Paris. Fontana's account of the expenditure connected with that in the Piazza di San Pietro, in consequence of the difference in the value of money and the improved mechanical means at our disposal, will not help us to an approximately accurate solution of the problem. The cost, then, of the French obelisk was no less than £80,000, instead of £25,000 or £30,000, as was recently stated in a newspaper. This, of course, included its transport from the banks of the Nile, instead of from the Western Islands; but it should be remembered that no land carriage had to be provided for it. Once shipped, it was brought to the very spot where it was erected. In the present case we should certainly save a considerable portion of the sea journey, but at the most moderate calculation we could only land the block within two or three miles of its ultimate destination. Some portion of the difficulty in removing it from the Thames to Hyde-park may be calculated by simply conveying a pole of 100 feet in length along the intended route. Could all the corners be turned without demolishing houses and adding to the expense? Again, the French obelisk is 72 feet high, and weighed a little over 200 tons. The Albert obelisk, at the most moderate computation, if, as is proposed, 100 feet high and of proportionate diameter, would not weigh a pound less than 500 tons. If the reader will but consider the effect of such a ponderous mass upon our roadways, and, moreover, upon our three or four brick rims of arched sewers, he may be led to an adequate idea of the fearfully expensive nature, if not of the absolute folly of the proposed undertaking.

That our architects and engineers could accomplish the task we have no manner of doubt; but for what purpose would the great sacrifice be made? Assuredly not to honour the lamented Prince, but to emulate the absurd vanity of the Cæsars, the Popes, and the French nation.

To return for a moment to the Paris obelisk. The pedestal is a single block of granite, and weighs itself upwards of 100 tons. If the Albert obelisk is to be a monolith, a corresponding monolith will be needed for its pedestal, for if that can be built up in blocks of moderate size, the folly of insisting on the monolithic character of the superstructure is only more conspicuously apparent. The sense of durability assumed as belonging to the monolithic obelisk would be impaired by its standing upon a pedestal without that manifest attribute. If the relative proportions of the obelisks are doubled, those of their substructures must equally be so; and as we know

the exact cost of the one, we cannot go blindly to our work of raising the other.

We admit that a monolithic is theoretically more durable than a built obelisk, but as both would, in all probability—their foundations being good—stand for thousands of years, they may almost be considered of equal value. Who that looks upon the Saint John Lateran obelisk notices that it is in three pieces? Or who stays a minute longer in admiration before that in front of St. Peter's on account of its being a perfect unbroken block? By being quarried in one block, the Albert Monument might become the most gigantic of laborious curiosities, and take highest rank in that class which embraces the Chinese balls carved in a single piece of ivory, one within the other; but if its height were treble that contemplated, it would still have a low character—one unworthy of the Prince who worked incessantly to elevate the people, and to instil into them better taste than such a monument would denote.

The *Times* compares a monolithic obelisk to a "church spire carved out of one stone, and raised in the mass." We accept willingly the comparison, but we could scarcely approve of an architect's practice, who, with sufficient knowledge of mechanics to construct a spire in that manner, possessed also the folly to do it. The leading journal makes this comparison in order to induce the committees for local memorials to abandon their projects and devote their funds to the London monument. We believe that no single one will respond to the appeal made to them. We might as well ask that no ordinarily constructed spires should be attached to country churches, in order that we in London might build one in an unreasonably extraordinary fashion.

England may not be the country for memorials, but that is no reason why, when a good opportunity presents itself, we should not endeavour to wipe out this reproach. A sneer at a local "statue faithfully copied from some well-known engraving" is particularly ungracious. Our sculptors, whether employed by Bath, Birmingham, or London, have all like facilities for reproducing the well-known and well-remembered head. The inscriptions in the country are not more likely to become more "smoky" or "dingy" than that in London. In fact, we should think just the contrary. It is not simply an "occasional visitor" who will look upon the provincial memorials, but the inhabitants—present and to come—who will have it associated for ever with their town, marking how they did their duty to the Prince who did his duty unto them. It is better that the memorials should be thus girdled by the feeling which caused their erection, than that they should be absorbed in the wasted expense of a gigantic monolith in or near Hyde-park.

We maintain that we should proceed in this matter irrespective of what strangers may think of us; find out the right track and pursue it steadfastly; but, even on the low consideration of a visitor's opinion, he would be more forcibly impressed with the loss felt by the nation in the Prince Consort's death, if, wherever he went throughout the length and breadth of England, in every town and hamlet, some record, even although it might be a "dingy, smoky inscription," a "statue copied from an engraving," or a "drinking fountain with inscription instead of text," met his eye, which told him that not only in London, but wherever the English tongue was spoken and English hearts beat, there was a common sense of grief for the Prince's death and of sympathy for our widowed Queen.

The reason given for asking our provincial committees to sacrifice their objects is that they may transfer the collected money to the London fund. We shall need, it is said, half as much as the cost of an iron-plated frigate to carry out the monolithic idea. The *Times* even estimates the weight of the monster at 1,000 tons. With its increased dimensions of 150 feet high and of proportionate width, it is not far wrong; but, with double the weight which we had calculated upon, the folly of such an undertaking is quintupled. If any real advance in art were gained by it—if it expressed, however slightly more, our gratitude to the deceased Prince, we should offer no objection to it. Even if it should be a "wonder of the world," what then? Would it compensate our provincial towns for the loss of those local memorials, which would "at least redeem them by a single object that carried them back to the past and reminded them of its greatness and its glory?" Would it be judicious to sink the money on the unseen and soon forgotten labour of transport, instead of investing it in sculptured works?

We decidedly think not. A much larger sum ought to be received for the London monument, and no doubt will eventually be obtained. The *Times* mentions three sources whence this additional sum may be expected—1. By subscriptions from the many substantial people and firms that have been biding their time. 2. By a Parliamentary grant; and 3. By the provincial towns throwing their subscriptions into the general fund. The second source is, of course, if possible, to be avoided; the third will, we think, be a vain expectation; and we are afraid even the first, although hoped for, may be long hoped for, if the monolithic obelisk of 1,000 tons' weight is pertinaciously adhered to. Much as we object to a utilitarian memorial, we would rather see the money thus expended than upon a transport ship and transport waggon.

But there is really no occasion for an appeal either to Government or the provincial committees, before we can think of something more than one of the starved columns, or forlorn statues, or prosaic institutions, in which the British nation has heretofore doled out its thanks to departed heroes and statesmen. We have only to dispense with the monolithic idea. We shall then save not only our streets, our sewers, and thousands of pounds, but great perplexity of brain. Let the monument be an obelisk, according to the Queen's and the nation's wish; but build it sensibly, instead of transporting it foolishly. Spend the money upon living

art, instead of upon dead labour. Rear a monument which shall tell an eloquent story to remotest ages, and not a senseless block, which will only kindle a kindred feeling in our posterity to that with which we now look upon the works of our painted ancestors.

A COMPARISON OF SOME OF THE DETAILS OF BUILDING ADOPTED IN ENGLAND, AND IN OTHER COUNTRIES.*

WITHIN the last three weeks my business avocations have called me into France, Belgium, and Holland; and although on previous occasions I had passed long periods of time in those countries, I was, on this one, more than usually impressed with the necessity, which all Englishmen must feel, of studying the habits of men working under the influence of modes of action different from those in which we ourselves have been educated, if we desired to retain our high position amongst the nations of the world. Very possibly the train of thought superinduced by the reflections connected with my lecture for this evening may have turned my attention with more than usual force to this subject; but there is so deep a moral lesson to be read by those who look a little below the surface in the histories of the three countries I have mentioned, that it behoves you, "foremen" amongst the workers, to derive all the benefit from it that you can. If you only learn this, that some good is to be found even amongst those whom Englishmen are too apt to regard as beneath themselves in intellectual rank, and that some of your own cherished habits and prejudices may be founded in error, you would do wisely to study the reasons which may have induced others to believe, and to act, otherwise than you are wont to do. For my own part, I believe that, even in matters of practical detail, we should do wisely to abandon some of our habits, and I, therefore, beg your impartial attention whilst I lay before you a short statement of the more obvious differences in the trades connected with house building as practised in England and on the Continent, from which we may learn a lesson—"one which may profit in the after time."

Now, in France, it happens that the bulk of the house construction is effected by the use of stone, instead of brick, for all external walling; and it is one of the artistic advantages of that country that the building stones there obtainable allow of the use of large ashlar blocks at a comparatively low cost. It is an old and very true saying, that "the class of materials generally used for buildings has a marked influence upon the character of the architecture adopted;" and certainly in those parts of France where freestones, yielding blocks of large dimensions are to be found, the architecture is of a bolder and of a more monumental character than it is in England, or even in the Flemish provinces, in Belgium or in Holland, where brickwork is almost exclusively used. This, perhaps, is more distinctly an architectural question, and so somewhat out of your province; but you may observe that the peculiar nature of the French stone has led to the use of a very different mode of handling it from the one prevalent here. Before describing this mode, I would observe that French masons are classed according to the description of work they are usually employed upon, either as "*maçons*" or "*limousins*,"—as we should say, as masons or wallers, for the word "*limousin*" is derived from the province of the same name, whence the best rubble wallers emigrate. The masons are subdivided into—first, the *appareilleur*, or the man who sets out the lines and makes the models, sets out the stone for the sawyers, and gives the general instructions—he is, in fact, the foreman; second, the mason, who roughs out the blocks; third, the *poseur*, or setter, who fixes them in the rough state—for it is to be observed that the mason only dresses the beds and joints, leaving the face rough; fourth, the *ravaleur*, or *tailleur de pierre*, who works off the face, and carves the various mouldings. Sometimes the mason also executes the rubble walls equally with the *limousin*; and if the rubble, instead of being random, be coursed and dressed, the mason only would be employed. He also executes what are known in France as the *legers ouvrages*, or the thin partition walls, the foundations of floors and ceilings, and the plasterer's work; indeed, in the centre of France there is no special trade of plasterer, and the mason combines the two trades we separate.

Now, the difference above alluded to in the mode of handling the building stones of France and of England consists in the fact that the French masons do not work their mouldings or decorations on the ground as we do, but they work them in place. This is easily done with the softer tertiary limestones of the Paris basin, and with the oolites of the north-west; but it is not quite so easily done with the upper oolites (of the Portland series), found near Boulogne and Dunkirk, or with the jurassic limestones of the valleys of the Seine and Rhone. Yet even in the latter districts the habit of finishing the work in place prevails, and I have also observed it to prevail in the north-west of Spain, where granite alone is used, and in Belgium, where the ashlar decorations are mostly executed in blue crystalline mountain limestone. I speak on this matter as an old mason, and I do not, therefore, hesitate to say that our neighbours' practice seems to me to be superior to our own, both economically and artistically, and I urge each of you as masons to examine the matter seriously. Our system is objectionable, firstly, because it is almost impossible to find two men who can work precisely alike from the same mould—one will set under, the other over; so that when a cornice, for instance, has to be placed, it is usually found that the "setter" is obliged to work off the edges of the stones, and thus the lines of the cornices are almost always irregular in an English building, and the separate mouldings do not meet truly. But in an artistic point of view the English system of finishing the detail of mason's work "on the banker" is objectionable, because the men who are so employed rarely have the opportunity of studying the optical effect of their own work, and thus they not only often waste labour by over-finishing, but also they neglect many little modes of securing effect which they would learn if they practised their handicraft under such conditions as allowed of their studying the influence of perspective and of reflected light. I myself firmly believe that much of the tameness and of the want of picturesque character in our modern English masonry is owing to our habit "of working under hand," and I suspect that its introduction here has only dated from the period when the Portland stone came generally into use in the metropolis, for many of the Medieval representations of building operations represent the masons of that period as working with the same description of tools which the French masons still use.

In bonding their work the French masons are by no means so careful as are our own, and they have a very sad trick of working off their beds and joints, so as, in fact, to leave the stones in the form of truncated pyramids. But they compensate for this, to a great extent, by the extremely careful way in which they make up their mortar, and in which they bed their work with it. There are, indeed, few things more surprising to a man who has studied the philosophy of lime than the way in which English builders misuse that important material, and this remark must be applied to our bricklayers, plasterers, and other tradesmen, quite as much as to our masons; and it is to be feared that the general employment of the quick setting Roman and Portland cements is leading us more and more to neglect the limes, which I believe will ultimately be found to be preferable to them, on the score of durability at least, when they are properly employed. This is a very wide subject, to which I may have again to return, if you would favour me by a hearing upon it; but I now confine myself to observing that all foreign mortar-masters attach extreme importance to the perfection of the primary slacking of the lime—that they ridicule the notion of using the lime "hot," that they are careful to insure an equal intermixture of the lime and the sand, preferring to effect that operation by hand labour, on the score of its securing a greater immunity from core—that they avoid excess of water, either in slacking the lime, or in subsequently making it up into mortar; they gauge stiff in fact—and that they take great care to counteract the absorption of the stones or bricks they use by watering them copiously. It is true that the cost of stonework in our country drives us to its use almost exclusively in the manner of a thin crust, backed up by brickwork; and that, therefore, in order to counteract the unequal compression of the two classes of materials, we are obliged to resort to the use of the rapidly setting and almost incompressible cements; but this is no excuse for the very slovenly way in which our workmen handle the limes they require for ordinary buildings, nor for many of the radically false practices they adopt. We have still much to learn from our French neighbours in the methods of working the natural hydraulic limes, and from the Dutch in the methods of employing mixtures of rich limes and pozzolanos; but the great secret of the superiority of foreigners in these matters lies, after all, in the greater amount of time and care they bestow upon them to what we do, and

in their removing them from the attributions of the "foreman of the pugmill" to those of the true "foreman," that is to say, of the man who knows something of the philosophical principles of the materials he works with.

It must not, however, be supposed that the Parisian mason is exempt from temptations to use contentious materials, whose rapid setting and early hardness may hide a multitude of sins in the way of bad bonding and bad working of the beds of the stone he employs. In fact, the anhydrous lime, so abundantly found near Paris, yields the coarse plaster universally employed in that part of France for setting the rubble masonry of the side and back walls of the majority of houses faced with monumental ashlar; and this plaster construction requires some peculiar precautions, to which it may be desirable to call your attention, in case any of you should, as I earnestly recommend you to, visit our neighbours. The real plaster of Paris, then, swells with irresistible force during the process of solidification, principally in a lateral direction; and care is, therefore, taken that the party, side, or partition walls, executed in rubble and plaster, should not be immediately connected with the front ashlar walls. I have known some of the latter even thrown down by the expansion of the walls perpendicular to them, and very great injury done to the ceilings by the resistance opposed by the walls to the molecular arrangement of the plaster during its setting. For walling purposes, however, plaster is commonly used in speculative buildings, and the only really useful lesson we can learn from this part of our neighbours' practice is, to provide, as carefully as they do, for the unequal shrinkage or compression of the materials we use. In ordinary London house building we are driven forcibly to employ materials which do not very differently under insistent loads and under the effects of seasoning, and I fear that we do not sufficiently guard against the disagreeable and unpleasant effects thus produced. I would add, before quitting this part of our inquiry, that the result of the French system of not recognising the distinction between masons and plasterers, and of executing all plasterer's work with the rapidly setting plaster of Paris, has been far from favourable to the execution of the internal decorations of their houses. The workmen do not acquire the special skill which usually attends the subdivision of labour; and, from the very nature of the material they work with, they are compelled to hurry through their operations to such an extent, that it is almost impossible to find in ordinary Parisian houses straight vertical mitres, true right angles, or perfectly even surfaces. The innate taste of Frenchmen enables the plasterers of that country to execute strictly ornamental details with more feeling than is usually to be found, alas! amongst our own workmen; but in matters connected with sober steadiness and truth, I certainly claim the precedence for our English plasterers over the French masons employed on interior decorations. As to the Belgian and Dutch plasterers, they seem to occupy a sort of intermediate position between those of England and France, as far as regards the organisation of the trade, and we have little to learn from them, except, perhaps, in the small matter of the provision made in most Belgian houses for the reception of the scaffolding required for the customary cleansing and painting of the stuccoed fronts of the brickwork. This provision might easily and well be adopted here; so I describe it, as consisting simply in leaving square putlog holes through the cornice and attic walls, which holes lead into the roof. Through these putlogs are inserted when the houses are to be painted, projecting beyond the face of the walls, and lashed down to the roof timbers in the interior, whilst the scaffold required for the workmen is suspended from the putlogs in such a manner as to allow the work to be completed without any interference with the street surface. The putlog holes, when not in use, are closed with a species of plug, bearing a patera, or some similar decoration.

I would call the attention of such of you as may be able to avail yourselves of the modern facilities for travelling, to the mode in which the French building trades have availed themselves of the constructive capabilities of hollow bricks. For building smoke or ventilating flues they have long employed terra cotta tubes of various sizes, from 9 inches square to 14 inches by 4 inches, so as to allow of their being lodged in an ordinary partition wall—"en teger ouvrage." Hollow bricks for floors, for partitions, for ceilings, domes, greenhouses, &c., are commonly used, and even a casual inspection of M. Eck's beautiful work "On the Application of Pottery and Iron to Building," must convince any candid inquirer that we are immeasurably behind our neighbours in this respect. Perhaps the increasing demand for fireproof construction may induce our architects and builders to inquire more than they have hitherto done into the capabilities of terra cotta ware; but hitherto our spirit of routine has seriously impeded our adoption of many very evident improvements which might ensue from its use, especially since these mischievously absurd exelute duties upon bricks have been abolished. In the meantime, it seems almost superfluous for me to dwell upon the advantages offered by a material of this nature on the score of its lightness, its resistance to the transmission of heat or of sound, and to the facilities it is able to afford to the establishment of any system of ventilation. The French builders practically avail themselves of these advantages, why should not we do likewise?

Before leaving the special consideration of the mason's art as practised in England and abroad, I would beg to call attention to the attention paid by French builders, architects, and engineers to the use of materials possessing certain definite physical properties in the positions they are the most fitted to occupy. Thus, in damp places, none but the more crystalline and the more non-absorbent stones would be used; in positions exposed to violent dynamical efforts of cross strain or of compression, the most resisting materials only are employed, and we look in vain throughout France for the fashionable absurdity of executing the body of a building with a resisting stone, and of coating the exposed angles with a softer one; as, for instance, when the plain faces of our church walls are executed of Kentish rag, and the quoins are executed in Bath or in Caen stone. It is very much to be regretted, we may here add, that the better class of tertiary limestones raised in the neighbourhood of Paris are not brought into our London market; but perhaps the improvements in the navigation of the Seine, and in the railway transit of the northern part of France, may remove the economical difficulties which have hitherto opposed this branch of trade and excluded us from a source of supply of such unbounded capabilities as the district referred to. Almost every description of stone is to be obtained in fact, near the Seine, or on the margin of the Northern Railway of France, from the *hard lias* and *roches*, to the softer *pierrres franches* and *vergelets*; and their colour is unexceptionable.

As to French carpenters' and joiners' work, the mystery is to explain how their men succeed in doing what they do with the very strange tools they employ. All the hand-saws they used in the days when I resided in France (and I do not think that free trade has yet effected much change in this respect), were simply bow-saws; mallet and chisel were almost unknown to the carpenters, and, instead of them, they used a strange looking tool about 2 ft. 6 in. long, and bearing a chisel, somewhat like our tenon chisel, at one end, and like a ferrom chisel at the other. These chisels are fixed to the bar, which has a handle about the centre, so that by the mere weight and leverage of the tool, it is enabled to work with singular effect, and even to serve, as occasion may require, as a plane, as an adze, or as a chisel of the respective kinds named. It is called a *bisauque*, and I am sorry to add that at times, it becomes a formidable weapon in the hands of the excitable Frenchmen in their drunken rows or in their faction fights. Strange looking as these *bisauques* are, the French workmen manage to execute, at a very cheap rate, the most complicated descriptions of carpentry; and I need only refer to Colonel Emy's or to Colonel Ardant's singularly beautiful and elaborately illustrated works on that subject, to prove that they are, at the least, as competent as we are to carry out any description of wooden framing. Rondelet's roofs, Emy's erect timber roofs, Kraft and Wiebeking's bridges, and the singular wooden bridges erected in Switzerland, indeed, show that the capabilities of the wood at hand were well understood, and successfully applied, by the carpenters of the whole continent, at a time when we were content with applying timber on a very small scale; and I suspect that it is only since the days of Peter Nicholson and of Tredgold that English carpenters have displayed the scientific skill and perfection of mechanical execution which justly entitle them now to the foremost rank in their pursuit.

It seems to me somewhat the peculiar form of instrument used by the French carpenters, and the somewhat illogical manner in which they frame their heading joints of king and queen posts, struts, and rafters, are to be explained by the fact that their practical habits have been formed upon the use of oak timber; whereas the habits of our modern school of carpentry have been formed upon the use of the more easily worked fir. In the more recently constructed French buildings the differences between the practice of the two nations has ceased to be discernible; and, indeed, the higher mathematical training of the better class of French workmen has led them even to improve many of the modes of framing they have learnt from us and from the Americans.*

* Read before the Society of Builders' Foremen and Clerks of Works, Lyon's-Inn Hall, on Wednesday, 12th March, by Mr. GEORGE R. BURNELL, civil engineer and architect.

* To be continued.

HINTS ON DESIGN IN ARCHITECTURE.*

THE excellence of any architectural design is in ratio with the amount of thought and study brought to bear upon it. This may also be said of other studies of a high intellectual order. It behoves us, then, to spare no pains in the production of our designs, so that they may be at once excellent and bear impress of deep and earnest thought. It has often been observed that "first ideas are best." Now, granted that they are, it would not be wise to make such ideas public in all their crudity and incompleteness, as, in all probability, they would not meet with that favour and recognition that they would otherwise have obtained had they been subjected to that scrutiny and afterthought so necessary to stamp them as originating in a lofty and cultivated mind.

How many architectural works do we see around that bear us out in this reflection, the designs of which are in many respects good, and, it may happen, very original, but, either from haste, inattention, or other causes, are not allowed to undergo the refining process by the mind of the architect necessary to rank them as works of the highest order of art. The student, therefore, should not spare any trouble in the preparation of his design, neither should he be satisfied with it until he has thoroughly studied and matured the whole, first collectively, then individually.

To carry out an architectural design successfully and complete in all its parts is no easy matter, but it may be done if the designer is determined, and he cannot make too great a sacrifice towards obtaining that reputation which is open to all, and should be coveted by those that are engaged in the profession. We cannot over-estimate the value of care and attention necessary to be bestowed upon any design that tends to raise it above mediocrity.

Architecture is peculiarly a public property, being brought before the eyes of thousands, and should endeavour in every possible way to add to the beauty of our towns and villages by erecting buildings appropriate to their several uses, and agreeable and harmonious with their surrounding companions.

Seeing the necessity for being careful in the preparation of our designs, I must now say that, in the development of them, the first ideas should not be lost sight of. It is necessary occasionally to make some departure from an original thought. Bear in mind, however, not to deviate too much, for then it may be stripped of all its freshness and originality. To an imaginative mind it is hard to curb the reins of fancy. This, however, must be done.

The façade of a building might be rendered admirable by the slightest alteration in the curvature of a window-head, by making the cornice deeper, or by the omission of certain features; but for the want of proper revision it is rendered objectionable to the eyes of skillful architects, and of dissatisfaction to others who are not competent to explain the cause of their disapproval.

It is convincing, then, that certain principles must be adopted to insure a successful result, and rules and principles, if made use of at all, must be capable of practical application; and I will to-night endeavour to give a few hints on the subject of architectural composition for the guidance of the student members of this Society, hoping they will be received as the result of some experience and great love for this branch of the arts. I do so with great diffidence, feeling that I am but a tyro myself; but if my paper should be the means of creating second thoughts, I shall feel repaid for any trouble I have taken in the preparation of it.

It matters little whether a building is to be designed after the Greek, Roman, Gothic, or Renaissance manner. Whether Venetian or Lombardic, Norman or Elizabethan, we shall, on examination, find ruling principles in all of them; and I am of opinion that the merits or demerits of any particular building rests not so much on the fact of its having been erected in this style, so much admired by one, or that style, deprecated by the other critic, but upon the presence or absence of principles that are indispensable to the perfection of every architectural structure.

Any design will be unsatisfactory and altogether a faulty one, no matter how pure a style you adopt, if you should violate the rules of composition; and a style not to be admired in itself—as the Chinese, for instance—might be turned to profitable account and made capable of many valuable suggestions, if infused with spirit and invention that is wanting in the other.

A great deal of valuable and instructive information has been written on the subject of architectural aesthetics, and Mr. Garbett's book, published by Weale, is one of the best of which you can possess yourself. The subject of design is fully and carefully treated. In it you will find much to instruct, and there is a freshness and force in the treatment of the whole subject that rivets the attention and delight of the reader. I would recommend it to all. I have read it myself several times, and found much benefit arise therefrom. My paper is but a few hints in a practical way, just jotted down for reference. I do not pretend to set before you such a dish as the one I have just alluded to.

Every habitable building requires to be provided with an entrance, windows for the admission of light, and a roof for protection against the inclemencies of the weather; and warmth is also necessary, we must make provision for securing this end by building fire-places, the chimneys of which, if carried above the roof, afford the designer an excellent opportunity of exercising his taste and skill. So far as necessity is concerned, these are all the parts to be attended to in designing dwellings; but if means are not altogether wanting to render the elevation an object of pleasure and satisfaction to the eye, it is to adorn and enrich these features that the genius of the architect must be brought to bear; and the first thing to be considered in obtaining this end is "breadth"—not by lineal measure, but by the just proportions of solid or plain surface with void and shadow. This is, generally speaking, very difficult to be done, as the overcast and gloomy nature of our atmosphere requires the windows to be of considerable dimensions; this disadvantage tending to destroy that breadth or repose so very necessary to a proper architectural effect.

As a rule, then, if your design requires a large amount of window space, more than is proper for the maintenance of this quality, you must leave the walls free from as little decoration as possible, only enriching the windows with small mouldings or a narrow architrave; and the cornice with a small string course and base moulding would be found quite sufficient to satisfy the eye.

It is not good taste to introduce—I may say, squeeze in—a buttress or plaster between windows or other openings closely set, thereby covering the wall space, that would have been much better left perfectly free from any decorative feature. Yet how often do we see this done? The defect I have just alluded to is particularly glaring if the window-heads be straight and are closely set up to the cornice or fascia above, for then the elevation presents altogether a disturbed and uneasy appearance, the solid portions of it, as it were, being in the form of a cross, or chequered, and becomes nothing more than plaster, cornice, and window. It would, indeed, be better to use curved or semicircular headed windows; although they would not admit so large an amount of light, yet they would allow of a small portion of the wall to be seen, as the spandrels above them would be gained by this means, besides making a variety in the lines of the composition.

Coupled windows, if the plan admits of it, enables you somewhat to get over this crux, as you gain additional wall space; and not only that, you then reduce the voids to one-half their former number, as each coupled window becomes as one, thereby simplifying the entire elevation, permitting you to treat them more elaborately with wider architraves than you could otherwise have done had they remained single.

Before I proceed any further, bear in mind that, if the proportions and positions of the general outlines in an architectural composition be not satisfactory and pleasing—if there are any radical errors and want of principle involved in it, then you had better not attempt to decorate or enrich it until you have carefully revised and corrected it, as any amount of subsequent adornment cannot rectify or make up for the want of this quality.

To insure breadth you can, as a rule, make the wall space between the windows equal in width to the windows themselves, but not less. This is, indeed, a good proportion where no buttress or column intervenes; but, on the contrary, if one of these features is introduced, you must increase the space between the window and buttress sufficiently to prevent a shadow from the latter entirely covering the wall space and reaching to the windows.

Having spoken on the importance of preserving "breadth" in your composition, I will now touch upon the several parts of an architectural elevation.

The doorway—no matter whether the building be a church, or exchange, or dwelling—

should be the most conspicuous and prominent feature in the façade, and it should always be designed and treated in a dignified and vigorous manner, as being the principal point of attraction. I am sure you will agree with me when I say there is nothing finer in architecture than the noble portals of some of our cathedrals and those on the continent.

A doorway cannot scarcely be made too large; that this is perfectly understood by the architects of the present time is evidenced by looking at the public and private buildings erected in this rapidly improving town within the last few years—a satisfactory contrast to the miserable and meagre entrances that were perpetrated during the two or three reigns previous to this one.

One important thing in designing a doorway (particularly if it be in the Italian style) is to give it a totally distinct character from the windows. We frequently see the head of a door treated in exactly the same manner and of the same shape as the window openings of the building, thus giving a long and disproportioned appearance, the extra height above the door (sometimes very considerable) being filled in with glass or ironwork. No light over a door should exceed half its width in height, unless it be a narrow one. The jambs should be built of a hard material, so as to resist any injury that they are occasionally (as in public buildings) very much exposed to.

The lower portion should be designed in a plain way, with fewer or no projecting members, or if delicate and enriched ones be adopted, take care they are protected by bold or plain parts.

As cornices do not seem to have been developed in Mediæval architecture, nor to have taken so prominent a position as to form an integral feature as the cornice of the anti-Gothic styles, perhaps, in speaking about this important part of the elevation, I had better take my example from an Italian design.

Give your cornice sufficient projection, but do not, as a rule, let it project more than its depth, unless it be constructed of wood, in which case it may greatly exceed this, particularly if it is supported by boldly designed brackets; in this case, however, it must be treated as a wooden construction, and not to imitate the forms of one only suited for a heavier material, as stone.

As your elevation may, perhaps, depend a great deal upon the cornice for producing shadow, see that you make it do its duty; but, above all, attend to the corona—this member is the principal one, and should be proportioned with great care, as it is the "echo" of the wall below, in the same way (as observed by Mr. Garbett) that the tenia, or astragal, is the echo of the cornice. As an uninterrupted cornice of some length would present a monotonous and tiresome appearance if the lower edge of the shadow cast from it upon the wall underneath was not to be broken by the modillions or blocks, these necessary members must be introduced to produce a satisfactory result; and it scarcely matters how they are shaped where they are always in shadow, provided their faces catch the light, and by this means break the line of shadow below.

Cornices should always be accompanied by friezes, as they tend to grace and dignity; their use seems to be to blend and harmonise the cornice with the wall, and are, in my mind, quite indispensable to a good effect.

If no architrave and few members are introduced below the frieze, it can be made much deeper than if accompanied by those features, and if slightly advanced from the general wall line of the building an improvement will follow.

The cornice, or upper member, in the architecture of the Mediæval period, although very different in its application, seems to possess the same guiding principles as in other styles. As it is, with rare exception, stopped by the buttress rising up at the division of every bay, it is not so requisite to introduce blocks or paterae to take away a monotony, but, at the same time, is much improved by those decorative features, as the shadow cast from them into the hollow at the back produces a fine contrasting line, and enables us to judge of its contour.

The Gothic cornice is frequently designed with a smaller member running below and parallel with it, which is as indispensable as the tenia in the other styles, unless the cornice includes a large cavetto, turning out at the lower edge and producing the echo.

We thus see that whatever style we adopt to decorate our buildings the same principles must be carried out in every case. We must have, in the cornice, the deep contrasting shadow cast upon the wall beneath; we must have the corona, with the cymation above; and, for the perfect satisfaction of the eye, some small projecting member to break the outline of the corona's shadow. The importance, then, of bestowing great care in the proportions of this essential feature of architecture is, I think, felt by all painstaking architects, and a "paper" exclusively devoted to it might be written at some length, and listened to without weariness.

The basement is, perhaps, not thought to require so much attention as the other parts of a building, for we see many erections that are faulty in this part; but if we give a little thought to the subject, we shall see that it is a very important one. Small feet may be considered a beauty by the Chinese, but a meagre, weak-looking basement is in no way to be accounted beautiful.

Now it is almost impossible to give too great importance to this essential feature in architectural design, and therefore study to preserve to it due boldness and freedom of treatment, but taking care to avoid coarseness. Restrictions are imposed by building acts that interfere somewhat with the carrying out of all that could be wished in designing a good basement. In the crowded thoroughfares of our towns it is sometimes almost impossible to give due importance to this feature, but, by ingenuity, a great deal may be effected.

In church architecture (as a considerable space is usually left free around the edifice) you are not so trammelled, and you have scope to produce a prominent basement; but in all cases it is right to design the several parts so that they may not be liable to receive any injury by getting knocked off or disfigured by passers-by.

To judge of the value of the basement, we have only to compare the building of the Oxford University Museum, designed by Messrs. Dean and Woodward, with the Liverpool Collegiate Institution, by Elmes; or the New Palace of Westminster, where the Victoria Tower may be seen one of the noblest designs conceivable—not intruding upon the eye of the spectator, but worthy to bear above its glorious brethren.

I may add that the introduction of window openings is to be avoided, as it materially weakens that stability of effect that true architecture should always possess.

On the subject of shadow, much I feel might be written, as it affords a very large field for thought and study. I am aware that a great deal has been said regarding this subject already, but it seems as if the attention that could be brought to bear upon it were unlimited, and I am, therefore, sorry that want of time will prevent me from doing anything but touch upon this part in the study of architectural composition.

In the first place, to bring good shadows, you must design good members and projections, both in the plan, or general outlines of your building, also in the chief features, and, lastly, the mouldings; and bear in mind, that an over-proportion of shadow will destroy "breadth," as well as create confusion, by a multiplicity of lines and decoration. You must, therefore, spare no pains in drawing out the details of your building, taking care to judge aright the quantity of shadow each projecting member will cast below, and above all, see that the profiles of them are gracefully and chastely drawn. It is a very common error to hurry over this part of the draughtsman's work, the general arrangement and disposition of the plan and the construction taking the most prominent place and attention; and frequently details are drawn out at a few minutes' notice, whilst a workman is waiting, which, when it is reproduced in stone, timber, or whatever the material may be, appears faulty, and a source of great annoyance.

The value of cast shadow (or that which is produced by one object that falls upon another), seems to be much appreciated at the present time, and is often carried to great length, square-faced and sharp angles being very often introduced, and even the ornamental portions are designed to give a crisp effect; but the extreme is to be avoided, as a harsh and unpleasant appearance is produced, robbing the horizontal lines and severe parts of your design of their proper value, yet adding no grace. The production of forms, other than simple geometrical ones, do not give a satisfactory result in flat-faced ornamentation.

As a right idea cannot be always formed of the effect certain portions of architectural detail may produce when executed and placed in position, if they are drawn out in the office, it is much better to do this at the building, as a far more satisfactory idea can then be had; and, if possible, small pieces should be worked, or run in plaster, and fixed at the proper height.

No full-sized detail should be drawn out from the small plans until a drawing to a medium scale be first produced, say 1 inch or 1½ to the foot (the latter is the best, as the

* By Mr. E. H. HEFFER, as mentioned in our last.

parts are easily measured off with a common rule), as it will generally be found necessary to modify or alter some of the members, for it often happens that the design has a coarser appearance when enlarged; therefore, this gives you the opportunity of refining it, and will ultimately be a saving of time and trouble in the preparation of the full-sized details.

MORTUARY CHAPEL, KENSAL GREEN CEMETERY.

WE give a sketch of the mortuary chapel over the family grave of the late William Pitt Byrne, M.A., and now in course of completion, in Kensal-green Cemetery, by Mr. Carey, of Great Portland-street. It is intended to answer the purpose of securing to the mourner visiting the last resting-place of departed relatives, a welcome privacy. It is built of Portland stone, and the door, as well as a cruciform window at the back, is glazed with ruby glass. Within, is a white marble altar slab, and above, a fine black marble tablet, bearing the epitaph in gold letters.

The late William Pitt Byrne was so intimately and honourably connected with the press that, while passing over his moral worth and the winning attributes of his private character, we are justified in paying a slight tribute to the distinguished abilities and extensive literary and classical attainments which he employed in the public service. His father, sole proprietor and sole manager of the *Morning Post*, having been stabbed one night in the office by a political assassin, Mr. Pitt Byrne, then a Fellow-Commoner at Trinity College, Cambridge, succeeded him in the proprietorship and management of the paper, and not only maintained its political character, but successfully extended its scope. Following the course pursued by his father, he viadicated the cause of independent journalism, and rigidly adhered to his practice of steadfastly refusing all offered testimonials.

Shortly after his marriage Mr. Pitt Byrne retired from his onerous duties, but he did not relinquish his literary pursuits, and continually contributed to the periodicals of the day. Proficient in ancient languages, he was at the time of his premature decease engaged on a work of deep research and universal interest, and proposed publishing a correct and accurate translation, with notes, of all the obscure or unintelligible passages in the Old Testament, especially the Psalms. From the curious errors he had already discovered, it is to be regretted he did not survive to complete the work.

MORTUARY CHAPEL, KENSAL GREEN CEMETERY.

DOORWAY, CHURCH OF SAN PEDRO DE OLITE, SPAIN.

THE church of San Pedro is one of two very remarkable churches in the town of Olite, in the kingdom of Navarre, pleasantly situated on the river Cidacos, once one of the jewels of the Navarrese Crown, but now fallen into neglect and decay, and only half populated.

We illustrate this week the very fine doorway of this church, and part of the façade, the whole of which is grand and massive, as well as elaborately sculptured. The tower rises to a considerable elevation, capped by a gallery with perforated quatrefoils, and from this springs a lofty spire. The proportions of the doorway are very good, and the ornament which decorates the mouldings of the arches and capitals of the columns is remarkable, both for the delicacy and freedom of its execution and variety of design. It was evidently constructed during the eleventh and twelfth centuries. The rose window over the doorway, it will be remarked, does not quite centre with it. The broad band running beneath the window is most elaborately and quaintly carved. The church was built by one Azzezzo Pinel, a notary of Olite, as is set forth in an inscription on the front.

LONDON FIRES.

THOMSON HANKEY, Esq., M.P., has sent a list of queries to the Lord Mayor, with the following note:—

My dear Lord Mayor,—I enclose a list of queries which I should probably put to any witnesses who would kindly attend on our Fire Committee on behalf of the City of London, and should be quite ready to put any others which the witnesses might desire, in order to give us such information as might be in their power as to the existing state of the laws, the efficiency, sufficiency, defect, or otherwise, for the general protection of London against losses by fire.

Our object is not to go into the question—as far, at least, as we can avoid it—as to the origin of fires, but, assuming that fires do occur, to inquire what is the best form of organisation in any large town for the general protection of the inhabitants against such calamities, and by what means the expenses attendant thereon can most equably be defrayed.

Before we go, however, into the question of future organisation, it is necessary to obtain all the facts we can as to existing laws, and as to the existing rights, which have, to a certain extent, supplanted the existing laws. We have evidence laid before us from the Home Office that it is not the intention of the fire insurance companies to keep up the present Fire Brigade. It is for us to take the best evidence we can as to whether London can safely be left without such a fire brigade; if not, whereunder whom it ought to be placed, and by what means the expense should be defrayed.

STATUE OF THE LATE MR. JOSEPH LOCKE, C.E.

A MEETING of gentlemen who had agreed to form a general committee for originating a memorial to the late Mr. Joseph Locke, civil engineer and M.P., was held in the theatre of the Institution of Civil Engineers, on the 12th inst., for the purpose of considering the form of the proposed memorial.

The Chairman, Lord ALFRED PAGET, in introducing the subject, referred to his personal acquaintance with Mr. Locke, his social qualities, the general regret at his loss, and the desire to perpetuate his memory by the erection of a statue to be placed in juxtaposition with those of Stephenson and Brunel, with whom he had been associated in life in the construction of the gigantic railway undertakings of this and other countries, as an incentive to the younger members of a profession to which Great Britain owes so much of her present grandeur and prosperity. Lord Alfred mentioned the communications which had taken place between himself and the Chief Commissioner of Woods and Forests as to the site of the proposed statue, and stated his belief that, notwithstanding the reply, he had little doubt but that if the application was supported by the influential gentlemen present, and assisted by the representatives of the Stephenson and Brunel memorials, it would be successful, and he promised to use every means in his power with this object.

Mr. J. J. HOPE JOHNSTONE, M.P., said that for many years he had the pleasure of the intimate friendship of Mr. Locke, and concluded a most touching address by moving a resolution in favour of the erection of a public statue to his memory. The resolution was seconded shortly by Mr. HAWKSHAW, and carried unanimously.

Mr. MOFFATT, M.P., alluded to Mr. Locke's remarkable zeal, talent, and energy, and the great engineering works in which he had been engaged, and moved that subscription lists be opened (limited to ten guineas) for the purpose of providing the necessary funds. This resolution was seconded by Mr. COBURN, M.P., and carried unanimously.

Mr. G. P. BIDDER referred to Mr. Locke as associated with Stephenson and Brunel in the early history of railways, and the natural desire, therefore, that a statue to his memory should be placed in juxtaposition to theirs. After alluding to his personal and cordial friendship with Mr. Locke, he moved the appointment of a committee for giving effect to the foregoing resolutions, and that Charles Manby, Esq., be requested to act as honorary secretary. The resolution was carried.

LINCOLN DIOCESAN ARCHITECTURAL SOCIETY.

AT the last committee meeting held at Lincoln, it was determined that the annual public meeting for the present year should be held at Market Rasen, on Thursday and Friday, the 5th and 6th days of June. The subject of the Cathedral pulpit was next discussed with some anxiety, as the cost considerably exceeds the sum that has as yet been subscribed for its execution. We have already described Mr. George Gilbert Scott's design. It consists of the pulpit and a canopy above it, interspersed with statuettes of prophets, &c., in carved oak, the cost of which last alone would, it is said, be £140. The treasurer, it was stated, had received a sufficient amount of subscriptions to enable the Committee to order the pulpit proper, but as the Chapter has expressed a very strong desire to possess the pulpit in its entirety, the Committee is anxious to fulfil that wish, and determined to send out circulars to the members and friends of the society in the hope that the requisite sum will be shortly raised. The whole cost of the pulpit will, we understand, be £450.

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post*. Gold watches, 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enable persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 & 34, Ludgate-hill, 46 & 47, Cornhill, London, E.C. Established 1749.

DOORWAY OF THE CHURCH OF SAN PEDRO DE OLITE, SPAIN.

THE LOCH KEN VIADUCT, PORTPATRICK RAILWAY.*

THIS viaduct was situated on a curve of half a mile radius, and carried a single line of railway over the loch at an oblique angle, so that the width of the waterway was increased from 265 feet to 360 feet, the depth of the water at the point of crossing being 29 feet in summer. It consisted of seven openings, three of 130 feet each in the centre, spanned by wrought-iron girders of the bow and string form; two semicircular arches of masonry, of 20 feet span, in the abutments; and two openings of 20 feet each at the ends, provided with flat east-iron girders. Owing to there being scarcely any current, it was not deemed necessary to set the piers in the line of the loch, but they were placed at right angles to the viaduct, and each pair of girders was at a slight angle to the adjacent ones.

The foundations consisted of strong gravel, except in the case of the east abutment of the main openings, where a running sand was met with, and in this instance the lower courses of the masonry were laid on a bed of hydraulic lime concrete 2 feet in thickness. The two deep-water piers were each formed of two towers, 8 feet in diameter, placed 8 feet apart, and connected above the water level by semicircular arches of masonry. For each tower of the piers a east-iron tube 8 feet in diameter, in six pieces, was sunk, the tubes being 36 feet and 42 feet in length for the east and west piers respectively. When the masonry was brought up to this surface, the upper castings of the tubes were removed. Around the piers 4,000 cubic yards of loose rubble stones were deposited, so as to produce an artificially deeper foundation. The tubes, when placed in position, sank from 1 foot to 2 feet, by their own weight, until they reached the gravel and sand, where they remained quite firm. This formed a good test of the sufficiency of the foundation, as the weight of the tubes on their narrow edges was equal to from 8 to 9½ tons per square foot, while the total weight on the foundations of the finished structure, including the moving load, was only about 6½ tons per square foot.

The method adopted in sinking the tubes was that of ordinary well sinking. Two plate-iron screw pans, of an inverted cone shape, were employed; one 2 feet in diameter at the top and 1 foot deep, and the other, which was only used for the harder portions of the excavations, 1 foot in diameter at the top and 1 foot deep. There were openings in the sides, covered with leather flaps, to prevent the material from escaping when the pans were filled. Three arms of round iron projected through the sides of the pans, and being connected to a long rod with a cross handle at the upper end, the screw pans were worked by four men, and when full were raised by tackle. The larger pan raised about 1 cubic foot of material each time, and the smaller one about one-fourth of that quantity. By these means the tubes were sunk in some instances as much as 18 inches in one day, the minimum being 2 inches per day in the case of the north tube of the west pier, where large boulder stones were encountered, rendering necessary the use of a screw pick. When the tubes had been lowered the desired depth, concrete was deposited within them, varying from 12 feet to 18 feet in depth in each tube. On this concrete ashlar masonry was laid, the cordon course being of granite, in large blocks, for receiving the ends of the girders, which rested on wrought-iron plates, laid on thick sheets of vulcanised India rubber, to lessen the effect of vibration.

The bow-and-string girders were each 136 feet 8 inches in length, and were segmental in form, the rise being 17 feet 6 inches, so that the segment was almost identical with a catenary curve, or the true curve of equal pressure. The sections of the upper and the under booms were identical. They consisted of a main plate, 24 inches broad and ¾ of an inch thick, and of two channel irons, each 8 inches by 4 inches in section and ½ an inch thick, placed at a distance of 8 inches apart, between and to which the struts and ties, of the same section of channel iron, were riveted. The transverse girders for carrying the roadway were 6 inches in depth at the ends, where they rested on the channel irons of the under booms, and 15 inches deep in the centre. The middle web of these girders was ¼ of an inch in thickness, and there were angle irons, 3 inches by 3 inches by ½ an inch in section, at the top and the bottom of the web on each side. Every alternate girder projected 2 feet, from which T iron struts were carried up to the crossings of the diagonal bracing. The weight of the girders and roadway between the points of support was 88 tons, and of the ballast (2 inches in depth) 14 tons, making a total dead load of 102 tons; and taking the rolling load at one ton per lineal foot, the total load on one span would be 232 tons. The area of the upper boom was 33 inches, and of the under boom, exclusive of rivets, 27.4 inches. The distance between the centres of gravity of the upper and the under booms was 17.04 inches. The tensile strain on the under boom amounted to 4.04 tons per inch, and the compressive strain on the upper boom to 3.35 tons per inch. When the whole of the load was upon the girders, there was no compressive strain on any of the diagonals, but there were tensile strains varying from 3.4 tons to 7.5 tons, or equal respectively to 9 cwt. and 1 ton per square inch of section.

The Author considered that the bow-and-string girder possessed advantages over the Warren or other lattice girders, with parallel top and bottom members; as in the latter class it was not possible to make the top and bottom members theoretically correct, without great labour and waste of material, and as, owing to the great variation in the strains on the diagonals, it was necessary that they should be of varying dimensions, involving in some cases even different sections of iron.

The girders were built in position on staging, and the greatest amount of deflection of any one girder from its own weight was ⅜ of an inch. Subsequently, when a locomotive-engine, weighing 34 tons, was placed in the centre of each span, and afterwards was run over, first at ten miles an hour, and then at twenty-five miles an hour, the deflection amounted to from ⅜ to ¾ of an inch in each girder, there being no perceptible difference in either case. Finally, when four engines were coupled together, so as to give a load equal to 1 ton per lineal foot, the deflection only amounted to from ⅜ to ¾ths of an inch.

The total cost of the viaduct amounted to about £13,000.

Mr. Tite has explained that the motto placed on the pedestal of the centre figure in the pediment of the Exchange was not suggested by the late Prince Albert, as generally supposed, but by Dean Milman; but Prince Albert suggested that this awkward surface, which puzzled the sculptor and architect, might be very appropriately filled with a motto.

* Read before the Institution of Civil Engineers, on the 4th instant, by Mr. E. L. J. BLYTH, M. Inst. C.E.

ARCHITECTURAL ASSOCIATION.

An ordinary general meeting of this body was held at the rooms, Conduit-street, Regent-street, on Friday; A. W. BLOMFIELD, Esq., M.A., President, in the chair.

Mr. J. C. ADAMS, Hon. Sec., read the minutes of proceedings of the last meeting, which were approved and confirmed.

Nomination.—The following gentleman was nominated for membership:—Mr. Francis Sills (proposed by Mr. Taylor; seconded by Mr. Waller.)

The Modelling Class.—Mr. BLASHILL drew attention to the importance of members of the Association joining the modelling class, attendance upon which he himself and many other members had found to be of great advantage. A little practice of working in the round was very beneficial, and gave gentlemen the capacity of drawing with much more facility and effect. He understood there was a chance of their getting some casts from the Architectural Museum if the numbers attending the modelling class was increased, and he hoped that such would be the case.

The CHAIRMAN agreed with Mr. Blashill. For the last two or three weeks unavoidable causes had kept him away from the modelling class, but he intended in future to attend regularly. Having had casts offered to them, and the whole subject having occupied the attention of the senior members of the profession, he thought they ought to have a good modelling class, and hoped to see an improvement in it before long.

Mr. R. O. HARRIS thought there was one thing that influenced the modelling class very much, and that was the time of meeting (six o'clock), which, on the class of design evenings, rendered the sitting very long. Six o'clock was a very inconvenient hour for many gentlemen to come to the class, and probably was the cause of the number attending the class not being greater; and he thought it would be desirable to make arrangements for meeting on two evenings of the week instead of Fridays only.

The CHAIRMAN.—There might be some difficulty in arranging that with Mr. Ross (teacher of the modelling class).

Mr. BLASHILL.—At present we have the rooms only for one night in the week.

The CHAIRMAN.—Certainly, to have two nights a week would be a better arrangement.

Mr. HARRIS thought it would be impossible to have a full modelling class on the class of design evenings or the ordinary general meeting evenings.

Mr. BLASHILL.—At present the class of design night was a long night.

The CHAIRMAN remarked that they had better consult with Mr. Ross on the subject, which they could not discuss at that time.

The subject then dropped.

Joinery.—Mr. J. A. BUNKER then delivered some observations on the subject of joinery, his remarks being illustrated by models of doors, floors, sashes, casements, skirtings, &c. Mr. Bunker said a good authority had defined joinery to be that part of the science of architecture which consisted in framing or joining together wood for the external and internal finishings of houses, such as the linings of walls and rough timbers, the putting together of doors, windows, stairs, and the like. It required, therefore, more accurate and nicer workmanship than carpentry, being of a decorative nature and near the eye. It was not his intention to describe all the materials in general use in joinery, nor the tools employed, but he would hand round the room a number of models which he had brought with him. He then showed a piece of white deal; they knew it was white deal by the knots, but the grain of it was very much like yellow deal; and also a piece of yellow deal, the chief difference being the dark-coloured knots; but the knots were now very often coloured, so that they were hardly able to tell the difference between white and yellow. He next showed specimens of pitch pine, which had a very large amount of turpentine; teak, which was pretty in colour and grain, and was also very heavy; and a piece of wainscot. Those were some of the materials, but there were many others used by the joiners. As for the tools, they ought to look round a joiner's bench and ask the joiner what the various tools found there were used for. Perhaps the simplest work a joiner had to do was to prepare floor boards. The best kind of floor was that which showed no nail holes. He then proceeded to describe the several descriptions of floors and skirtings. He reminded his audience that in making drawings for joiners' work they should ever remember that wood would shrink. Having had the floors laid and the skirting fixed, they should then think of doors. In order to that the foreman of the joiners got his rod and set out a section, longitudinal and transverse, of the doors the joiner had to frame. The rod was sent to the chalk-line foreman, whose duty it was to cut everything for doors with the least amount of waste. The lecturer then exhibited a model of a four-panel square door, and described the mode of making it with much minuteness, including planing, taking out of winding, thicknessing, mortising, tenoning, ploughing, gluing up, cleaning off, &c. He next proceeded to explain the mode of fixing and hanging doors, referring to various kinds of doors, both ancient and modern. He next spoke of sashes, which were various in their description, and generally got their name from the section of the bar. The simplest kind of sash was one fixed into the linings, which might be double or single, as might be wished. Mr. Bunker next proceeded to explain the mode of hanging sashes, the operation of the pulleys, and the preparation of sash linings. He then described the construction of stairs, plain and secret dovetailing, door frames, and other matters connected with the subject of his lecture, and resumed his seat amidst applause.

The CHAIRMAN said he was sure they were all very much indebted to Mr. Bunker for his remarks, and he hoped they would draw forth some discussion. He certainly thought it was too often the case to describe things in specifications they did not understand, and it would be much better very often if they put more into their drawings and less into their specifications. There was a great deal of conventionalism in modern joiners' work, and by putting more in their drawings they should be able to hit upon new forms of joinery which would be of advantage.

Mr. THOMAS M. RICKMAN thought they must all join with Mr. Paraire in thanking Mr. Bunker for his lecture, and for bringing before them specimens which were of much more importance than any quantity of reading or drawing. He proceeded to say that the question of veneer stood much in the same way as the question of gilding. The value of a log of mahogany fit for being cut up into veneers had reached £1,000 and more. Mr. Bunker had not alluded to the great use of machinery at the present day in working the elaborate portions of

joinery, nor to various methods of flooring in use, such as laying two thicknesses of floors, laying felt on floors, and so on. The lecturer spoke earnest of floors with dowels, but he (Mr. Rickman) thought such floors had objections, though dowelling had this great advantage, that it prevented winding of the boards, and the great difficulty of treating oak, especially English oak, was that it did wind most dreadfully. As to the matter of showing the end of the grain, according to the Gothic principle the beauty of a wood consisted in showing the end of the grain; but at the same time the Classic principle was that there was a greater beauty in the side way of the grain than in the end way. The two arguments did not meet, he apprehended, in any way, and they must, therefore, take their stand either on one or the other. Of course they might follow Mr. Bunker in the various matters he had brought before them, staircases especially, and other portions of joinery. He should like the lecturer to explain to them the formation of a circular well-hole at an outer cut string. A great deal of the most interesting part of a staircase was hidden by the plaster behind, as the lecturer had remarked; and it was desirable the construction should be visible. In some Gothic works he had seen the whole construction of the staircase was seen very well indeed. It would be very useful for all those who wrote specifications to write what was proper, a word which they were in the habit of meeting in price-books. He should like to know what was the meaning of the word *proper* in reference to specifications. It would be of great advantage to them that they should understand the meaning of and be able to use freely all the technical terms which Mr. Bunker had elucidated, and to know how many they should use in describing a thing, and to keep up the same pitch in describing their specifications. He thought an architect in describing his work ought to take one pitch in his specification, and to make it intelligible for the class of contractors he expected to work under him.

Mr. C. H. F. LEWIS said there was one objection to showing the side of the grain, and that was the durability of the wood, especially for outside work.

In reply to a Member,

The CHAIRMAN said the only apparent aim of modern joiners' work was as far as possible to conceal the construction, as in secret dovetailing.

Mr. JOHN BROWN, architect, Norwich, explained, by means of models, his patent cloth padded strips for window sashes, French and other casements, doors, show cases, &c., to exclude draughts, dust, wet, and other annoyances arising from the imperfect fitting of the above. The patent had been successfully applied in a great many cases.

A vote of thanks having been passed to Mr. BUNKER, on the motion of Mr. NEW, the meeting broke up.

BITUMINISED PIPES.

A BRADFORD subscriber asks for information—first, as to whether the patent bituminised pipes are a durable and strong pipe; second, as to whether it is possible to make a perfect plumber's join where the main and service pipes joins; third, whether the water running through is likely to taste of the bitumen.

INJURIOUS ACTION OF LEAD PIPES ON WATER.—The Sub-Committee appointed by the Manchester and Salford Sanitary Association to investigate the action of the water supplied by the Manchester Corporation upon lead, have made their report upon this subject, and the Association, in issuing it, especially urge upon all persons using water which passes through lead pipes the importance of attending to the closing advice of the report—never to use water for dietary purposes which has remained even for a few hours in the pipes. The Committee state that they are greatly indebted to Dr. Grace-Calvert for the valuable assistance rendered by him in carrying out the experiments at the laboratory of the Royal Institution. New ordinary lead piping, through which the water would pass rapidly without becoming deteriorated, was found to impregnate it with from .02 to .04 grain per gallon after being allowed to stand in it a single night; similar results being obtained from daily experiments extending over a month. When the water was allowed to stand in the pipes for twenty-four hours it became impregnated with from .05 to .25 grain per gallon. The experiments were made upon four varieties of lead piping—extra-tinned, ordinary, best or virgin, and common. The water from the virgin was found to be more impure than that from either the extra-tinned or the common pipe, the ordinary lead containing far less impurity than either upon the first experiment, whilst the second experiment gave a different order of results—the water in the extra-tinned piping the purest, that in the virgin next, then the ordinary, and lastly the common. From the experiments which have been carried on during a period of two years, in which more than 300 samples of water have been tested, it has been concluded that the Manchester water does act on lead pipes to a very serious extent; that that action continues for a much longer period than is generally supposed; that when the water remains stagnant in the pipes it not only becomes highly charged with the dangerous poison, but a coating is formed on the inner surface of the pipes, which coating is subsequently detached by the water passing through, and which it impregnates with lead; that even after pipes have been used a considerable period, the quantity of lead contained in the water which has remained twenty-four hours in the pipe is quite as great as in cases where serious effects have been known to ensue to parties using the water; and that the practice of lining lead pipes with tin affords little, and only temporary, protection, and is of no practical value. Bearing in mind that lead is a cumulative poison, and that water containing it may be used for a considerable time, and the foundation be laid for great suffering and physical injury before the symptoms became so marked as to justify a medical man in pronouncing the case to be one of lead poisoning, the discovery and adoption of pipes for domestic supply which could not be productive of this evil is of the greatest moment, especially to our densely populated labour districts. The first step towards remedying the evil is a thorough conviction of its existence, and of the serious results which may follow from disregarding its importance. Let the community at large be convinced on these points, and it is more than probable an efficient remedy would be discovered, more especially if the Corporation would offer to parties engaged in the necessary pursuits some inducement to produce a pipe economical in cost, easy of application, and on which the water would not act prejudicially.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary general meeting of this body was held at the rooms, 9, Conduit-street, Regent-street, on Monday evening; the President, WILLIAM TITE, Esq., M.P., F.R.S., in the chair.

Mr. T. HAYTER LEWIS, hon. sec., read the minutes of proceedings at the last meeting, which were approved of and confirmed.

Death.—Mr. JAMES BELL, hon. sec., announced the death of Mr. W. C. Lochner, fellow. If any member would communicate some account of his career to the honorary secretaries the council would be obliged.

Letter from the Queen.—Mr. T. HAYTER LEWIS stated that the President had received a letter of which the following is a copy:—

Lieutenant-General Grey presents his compliments to Mr. Tite. He has had the honour to lay Mr. Tite's letter of the 27th ult., with its enclosure, before her Majesty the Queen, and he is commanded to express her Majesty's approval of the resolution of the Institute of British Architects, granting the royal gold medal to the Rev. R. Willis.

The reading of the letter was received with cries of "Hear, hear." Mr. Lewis further announced that Professor Donaldson had received a letter from Professor Willis, expressive of his high appreciation of the honour conferred upon him by the royal gold medal having been awarded to him by the Council.

The New Laws of the Royal Academy.—Mr. HAYTER LEWIS stated that he had received a letter from Mr. Sydney Smirke relating to some changes made in the rules of the Royal Academy, accompanied with a copy of the new regulations passed by the Royal Academy, relating to the admission of students in architecture, which came into operation at the commencement of the present year, and which gave greater encouragement than hitherto to architectural students. Professor Smirke, in his letter, said,—

I think it is right that the attention of the Council of the Institute should be called to the fact that some important changes have taken place in the laws of the Royal Academy relating to the admission of students in architecture, which changes came into operation at the commencement of the present year. I send herewith a copy of the laws as they have been amended. The Council will perceive, with satisfaction I am sure, that greatly increased encouragement is held out to architectural students by the institution of biennial scholarships, and of an annual travelling studentship, besides the gold medal travelling studentship, as heretofore.

But the chief object of my present communication is to suggest that the Council of the Institute should consider and determine the nature of the certificate, which, as you will perceive, is now substituted for the preliminary probationary drawings which have hitherto been required to be expressly made by all who desired to be admitted as students in the Royal Academy. Any drawing the applicant may have by him adequately showing his proficiency will now suffice. The Council should, I submit, decide at once on the form of their certificate, and on the nature of the ordeal to which the Council may deem it expedient to subject those who may desire to be certified by the Institute as fit persons to become students in the Royal Academy. Any regulations in this respect that the Institute may think proper to lay down, I shall feel much gratified in communicating to the Council of the Academy.

The reading of the letter was received with applause.

The CHAIRMAN said it must be very gratifying to them all to find what was the encouragement held out to architectural students now, which was not the case when he and other gentlemen present were students at the Royal Academy. He was very glad to find that greater attention was being paid to architecture by the Royal Academy, and they must take it as evidence of the desire of the Royal Academy to promote architecture by all the means in their power.

Professor DONALDSON showed from the new rules of the Royal Academy that architectural travelling students would derive great advantages under their operation.

Mr. G. GILBERT SCOTT remarked that there were also some facilities for students in architecture becoming also students in figure drawing; they had not to go through the same ordeal as other applicants for admission to such a class, rather less requirements being now made for an architectural student.

After a few remarks by Mr. C. H. SMITH the subject dropped.

The Art-Copyright Bill.—Mr. G. GONWIN inquired whether the attention of the Council had been directed to the Art-Copyright Bill now before Parliament. In the present Bill architecture was altogether left out, and the general opinion that prevailed in respect of it was shown very forcibly a short time ago, when the Lord Chief Baron, in summing up a case (in which an action had been brought by a photographer to protect certain photographs, and which he succeeded in maintaining), pointed out what could be protected and what not. For instance, if a person paid an architect a hundred guineas for a design, any one, when it was executed, could produce it; but the Lord Chief Baron showed that if any one got a negative from a photographer, and thereby produced positives of architects' buildings, he was liable to an action. A greater proof could not be given to show the necessity of protecting the architects.

The CHAIRMAN said the matter had already been noticed by the Council, and would not be neglected by them.

New Members.—The following gentlemen were duly elected, after having been balloted for:—Mr. Thomas Chatfield Clarke, Associate, of 137, Leadenhall-street; Mr. Charles Fowler, Jun., Associate, of 12, Furnival's-inn, as Fellows.

Pictorial Mosaic as an Architectural Embellishment.—Mr. M. DIGBY WYATT, V.P., then read a paper entitled "On Pictorial Mosaic as an Architectural Embellishment," which will be found in another portion of this issue. The paper was illustrated by a great number of drawings, rubbings, mosaic-work, engravings, prints, designs for mosaics, materials for the formation of mosaics, &c., &c.

The CHAIRMAN said he was quite sure they all felt great obligations to Mr. Wyatt for his paper—that was a common form of expression, but he used it with the greatest sincerity, because it was a subject which Mr. Wyatt thoroughly understood, and that evening he had developed it with much ability. The subject of the lecture was one of great importance at the present time, when efforts were being made in the way of causing our cathedrals to grow up with new beauty. The difficulties in this country attending the execution of the extraordinary work of mosaics appeared to have been overcome, for a specimen before them showed that English workmen could produce work equal to the very best work of ancient times. He then invited Mr. Penrose to give some information as to the probability of introducing mosaics into the great metropolitan cathedral of St. Paul's, and the probable expenditure of doing so.

Mr. PENROSE.—Mr. Wyatt in his paper that evening had referred to certain information which he (Mr. Penrose) obtained in Italy respecting the cost of mosaics. With respect to the estimate of an extraordinarily high figure from Rome, he had no doubt it was a veritable estimate, given in figures which he could not mistake, and he had no doubt that if they went so far those who made the estimate would be very glad to execute the work for the money named in

the estimate. But as he knew the style of work at Rome was of a more expensive character than was wanted here, he did not think it right to prosecute the matter further, or to attempt to cheapen the work. From inquiries as to prices made at Murano and other places in Italy, he believed that work at a distance might be done in mosaics for 25s. a foot—that was including all work. On the principle of the prices in Italy he had imagined—and he believed the fact of imagining it brought one nearer to the execution than if one did not believe in it and hope for it—he imagined that they might cover the whole dome of St. Paul's, as Sir Christopher Wren intended it should be, with mosaics—and the dome comprised about 15,000 feet—for or under £20,000; and cover the spandrels of the dome, each about 270 feet, at rather a large figure per foot, but still at an expense of about £500 each, and so on with other portions of the cathedral. He supposed that if they had the means of raising £50,000 for mosaics, Sir Christopher Wren's idea of carrying colour through the whole of his great building could be carried out. He must own he felt a great bias in favour of vitreous material rather than another, because he thought there was a greater depth of colour obtainable by that means—(Hear, hear). He never thought otherwise than of employing English workmen, because he thought the employer and the employed would understand each other better, and that, by the workmen's skill, better work would be obtained than by the employment of Italians. But, in the first instance, he thought of obtaining the material from places where it was best made, and then of encouraging our own manufacturers to equal or surpass it. About three years ago the committee of St. Paul's had £5,000 or £6,000 in hand, and he thought that with that sum they might do a small specimen of mosaic work, but they found more important matters to spend their money upon, and since that time he had not had any immediate hope of their executing any mosaics, but he did not resign his expectation and hope to have on a future occasion the pleasure and privilege of explaining to the Institute what had been done at St. Paul's in this respect instead of speaking of what it was hoped would be done—(Applause).

The CHAIRMAN invited Mr. Fergusson to make some observations on East Indian mosaics.

Mr. FERGUSSON said there really was very little or nothing known about East Indian mosaics. It was quite certain there was no Italian drawing in design amongst them; they were purely local. Some of the patterns cut in stone, inlaid in jaspers, agates, and bloodstones, were extremely beautiful and greatly elaborate. The effect was as highly pleasing as that of any ornament he knew of. If the Italians did suggest this mode of decoration to the Indians, the latter carried them out in their own way, and improved upon them. But there was extremely little known respecting them, or who did the work. In answer to a suggestion thrown out by Mr. Penrose, Mr. Fergusson referred to the mosaics found in the basilicas and round churches of Salonica. The round churches there were covered with mosaics of about the third or beginning of the fourth century, extremely beautiful, and still perfect, while others were more modern, being, perhaps, of the twelfth century. They were a most interesting series of mosaics.

Professor DONALDSON moved a vote of thanks to their friend Mr. Digby Wyatt; he was sure the attention of all had been riveted by the very able, amusing, and instructive lecture which he had given them that evening. His lecture was of the greatest value to every one present, and he had hardly left any observations to be made by those who followed him. There were, however, a few suggestions which he should like to throw out. He was inclined to think that the subject of tesserae mounted higher than Mr. Wyatt admitted; he thought the art mounted to a very high origin indeed, and the traditions handed down to us seemed to show that. The mosaics of ancient times pervaded every structure, monumental edifices, and every building adapted for any use at all. In Cairo you could not go into any church that had not its mosaic pavement throughout, and even in the commonest buildings the visitors found the most beautiful geometric pavements of all colours, and having in them very valuable stones. And at Venice the floors were a copy of the very same style of art pursued in mosaics by the ancients. Mr. Wyatt had alluded to the mosaics in the church of Novara, and he (Professor Donaldson) was some few years ago much struck with the pavement there; the mosaics were extremely interesting, and any of their friends who travelled in the north of Italy he should advise to visit Novara, and study the mosaics there, for they were very curious. With respect to the Cirencester pavements, they were very fine and resembled the Greek. In the tesserae there was great variety of delicate tones, which had very great effect. There was a polish, vigour, and intensity about the mosaics which drawings of them did not represent. Then, beautiful mosaics had been brought from Carthage, and were in the lower room of the British Museum. Many of them were very fine compositions, while others were coarse. Mr. Wyatt seemed to think that the art of Rome sprung up full-grown, but he did not think any art could do that, it must grow for years. No doubt the Roman artists had the benefit of Greece, but they must have studied for years in the carrying out and perfecting of their own style. He thought the art of Rome must have gone through many years, perhaps centuries, before it attained that perfection in which it was found. The Persians of the present day exhibited a taste for mosaics. With respect to the Indian mosaics they had always appeared to him to be very much of the Italian sentiment, and some of them reminded him of the Florentine mosaics, having about them a great deal of the same character. But, perhaps, the Indian mosaics were better executed than those sent from Florence. There seemed, however, an identity between the productions of the one country and those of the other. There was a great deal of European influence upon some of the Indian mosaics. The learned Professor then referred to the beautiful mosaics at Lyons, which were the very highest specimens of art. They were in design and execution inferior to none that had been exhibited at Rome. He hoped the Trustees of the British Museum would not leave the mosaics in their possession in the cellars of the institution, but bring them up, so that they might be better inspected.

Mr. G. GODWIN referred to the point of durability. At Cirencester and other places the pavements were in a wonderful state of preservation, and when they recalled the condition of some of the pavements which had been laid only four or five years, and were worn away already, one saw that they should apply themselves to the question of durability. He pointed to the very elaborate pavement in front of the altar at the church of Wilton, a portion of which was very much worn and the colour very much decayed. Instead of giving up wholly vitrified pavements they ought to consider well before they did so. He seconded the vote of thanks to Mr. Wyatt, who had thrown himself wholly into this subject and exhausted it.

The CHAIRMAN said there was one caution which his own experience would teach him with regard to tesseraed pavements. He intended introducing a pavement of that kind into the Royal Exchange, had it designed by an eminent artist, and carried out by Mr. Singer. But the Portland cement in which the tesserae were set decomposed, and it became as soft as if they had been set in putty. The result was it had to be taken up, and the whole of the pavement was abandoned. The setting of pavements that were to be walked upon was of the greatest possible importance, and it was a matter that required a great deal of caution. Regarding that point they had some experiments to make and greater experience to gain.

The vote of thanks to Mr. Wyatt was carried by acclamation.

Mr. WYATT, in acknowledging the compliment, remarked that as to ancient mosaics found in this country, they were found of the most mixed materials.

Professor DONALDSON said there was a curious mosaic behind the high altar at Westminster Abbey; he did not know whether their friend Mr. Scott had made any particular observations respecting it.

Mr. G. G. SCOTT thought if Mr. Donaldson examined it he would find it was made of marble.

Professor DONALDSON.—No; he had examined it.

Mr. HAYTER LEWIS.—When at Venice a short time back he saw them repairing a beautiful mosaic, and the old gold was found to be of the richest character.

Mr. WYATT.—The old gold was entirely different from the gold used at the present day, and that led to a difference in the effect.

Mr. FERRY said Mr. Wyatt made no reference to external mosaics, of which there was a fine specimen in the Cathedral at Prague. All the mosaics of which Mr. Wyatt had spoken were under cover, under shelter. But it was proposed to have mosaic wall pictures on the outside of the permanent picture galleries for the International Exhibition, in Cromwell-road, South Kensington.

Mr. WYATT avoided referring to external mosaics, the object of the paper being to bring before the meeting mosaics suitable to this country. He thought it was almost impossible to make external mosaics without the joints being somewhat open, thus the moisture got in, and frost followed, which, of course, injured the mosaics.

The meeting then broke up.

ARCHÆOLOGICAL INSTITUTE.

A MEETING of the members of the Archæological Institute was held on the 7th inst., O. MORGAN, Esq., M.P., V.P., in the chair.

The first paper read was by Dr. MACGOWAN, illustrative of a rubbing from a remarkable incised slab, of an inscription of very remote antiquity, now preserved in China.

Mr. SHURLOCK read an account of excavations carried on recently by him on the site of the great Abbey of Chertsey, and of the discoveries he had made, enabling him to trace out the entire ground-plan of the conventual church and other subsidiary buildings.

A series of drawings, by Mr. ANOELL, were exhibited, representing a great variety of pavement tiles with designs from romances, the signs of the zodiac, and others simply geometrical. Many of the original tiles were also exhibited, as well as some portions of gilded and painted mouldings, models of several stone coffins, and other objects of interest brought to light in the course of the excavations. Mr. Angell, the proprietor of the site of the Abbey, expressed his readiness to oblige any member of the Institute who might desire to examine these very interesting remains.

Dr. WILKINS described the discovery of Roman remains recently, near Newport, during the operations of some railway works. A large number of cinerary urns were found, indicating probably the site of an extensive cemetery. They were of the usual brown ware. Quantities of oyster shells were also turned up, and fragments of Samian ware and other objects, signs of an extensive occupation by the Romans.

Mr. ARTHUR TROLLOPE communicated an account of a singular shaft lately found in the garden of a house in Lincoln.

Mr. S. P. FREEMAN exhibited three gold medallions, lately obtained from Athens. The subjects represented are Bacchanalian, and of Greek workmanship, in *basso relievo*, highly finished.

Professor DONALDSON exhibited two funeral urns, lately found in catacombs near Alexandria, and also two drawings of the chambers, &c., which had been forwarded to him by Mr. H. J. Rouse, the engineer engaged at the railway works which have brought these Columbaria to light. One of the urns exhibited was still unopened; the other was of black ware, with wreaths and other ornaments painted in white.

Some Spanish, German, and Italian weapons were exhibited, and some examples of the work of the Milanese armourers—a part of a steel war-saddle, engraved with the royal arms of Portugal, together with powder measures, spanners, plug bayonets, daggers, &c., by Mr. Bernhard Smith and Mr. R. T. Pritchard; also some weapons found in the Thames, brought by Mr. W. Burgess.

Mr. W. W. WYNN, M.P., exhibited some early documents relating to Wales; also a beautiful ivory diptych, with sacred subjects, from Valle Crucis Abbey; a set of counters, engraved with royal portraits, probably by Crispin de Pass.

Mr. H. BOHN showed an oval silver medallion with a portrait of Mary Queen of Scots, with the date 1580. The costume, &c., resemble those in a portrait of Queen Mary in the possession of the Duke of Devonshire, at the date of this medallion.

The Rev. E. L. BARNWELL sent a stone hammer-head, of white stone, being hard and bearing a high polish, the surface worked in grooves in a reticulated pattern.

Two silver matrices were sent by Mr. WATERTON, and a lock and key of Nuremberg work.

SOUTH KENSINGTON MUSEUM.—During the week ending 15th March, 1862, the visitors have been as follows:—On Monday, Tuesday, and Saturday, free days, open from 10 a.m. to 10 p.m., 13,085; on Wednesday, Thursday, and Friday, students' days (admission to the public 6d.), open from 10 a.m. till 5 p.m., 1,130. Total, 14,215. From the opening of the Museum, 2,551,502.

ON PICTORIAL MOSAIC AS AN ARCHITECTURAL EMBELLISHMENT.*

IT is now fifteen years since I had the honour of bringing under the notice of this Institute a branch of the art, upon another department of which I purpose making a few observations this evening. I was induced for some time prior to that date to pay attention to the subject of *geometrical* mosaic for two reasons—the one general, the other special. The general, because I looked upon any possible addition to the technical *plasmacopia* (if I may so express it) of the architect as conducive to the introduction of the most legitimate novelty in his art; and the special, because I recognised in the contemporary efforts making by enterprising manufacturers, and in a rapidly growing demand on the part of the cultivated public, every probability that an important branch of industry was incubating by the one, and likely to be hailed with welcome by the other.

A parallel conjuncture of demand and supply one cannot fail to perceive to be approximating at the present date in relation to pictorial mosaic; and in the hope that my humble exertions may contribute in some degree to the development amongst us of that branch of the art, as to a certain extent they may have done in past years with respect to geometrical mosaic, I venture to address to the meeting this evening a few remarks mainly limited to the practical interest of the subject.

It would, however, be an act of dereliction to the real grandeur of my theme if I failed to notice what important subjects of inquiry for the art-student, any such limitation necessarily precludes our taking cognisance of this evening.

Thus, firstly, there is the invaluable illustration which the series of still existing pictorial mosaics, dating from the earliest to the most recent Christian epochs, might be made to afford of the changeful spirit in which, at various periods, fervid faith has, as it were, assimilated to itself—now one, and now another, cycle of religious personifications of a more or less simple or complicated Christian mythology, sometimes veiling its aspirations in symbolism, and at others setting forth dramatically the leading events upon which its hopes and fears were based.

Next, perhaps, to this, which may be designated the liturgical interest of the art, is that which is more strictly speaking iconographical, including the much vexed question of the degree in which many of these generally rude but nearly imperishable pictures which survive, while almost every contemporary graphic record has perished, reflect the usual aspect, the costume, and true physical characteristics of the clergy and laity, the rulers and the ruled, in the early ages of Christianity.

Von Hülsen, in the "Italienische Forschungen," thus ably hints at the suggestive value of such primitive records—"There is, indeed, much in the representations of the early Christian mosaics which carries us back into extreme antiquity, perhaps into the very first century of the reign of Christianity. In these our Saviour, the Apostles, and Prophets invariably appear in complete classical costume,—in long tunics, with the palliums superposed, and with naked feet, protected only by the sandals commonly worn in imperial times. When recent saints are introduced, the habits of antiquity are exchanged for rich and more barbaric dresses, and the feet are usually completely covered. The value of these ancient types we find acknowledged by subsequent artists as celebrated and modern as Raffaele himself; for, as the same writer justly remarks, in the cartoons and in some of the most remarkable of the Vatican frescoes, we cannot fail to recognise an approach to the primitive forms of early Christianity, in the guise of a return to classical models, subordinated to the conventions handed down from the Church of the early fathers by tradition from artist to artist and from priest to priest."

Thus, thirdly, is there a purely archæological interest attaching to pictorial mosaics, connecting those decorations with the individual by whom or for whom they were executed, with the specific periods at which they were wrought, and with the structural peculiarities of the monuments they adorn. On this branch of the subject Ciampini, Farietti, and Spreti have left but little virgin soil for nineteenth century literary labourers to dig into.

Thus, fourthly and lastly, is there also an interest which affects us, as architects, more nearly, probably, than either the liturgical, iconographic, or archæological. I allude to the illustration afforded to the general history of graphic art by the numerous relics of pictorial mosaic which supply, for nearly every century from the Christian era downwards, an unbroken series of documentary evidence of those fluctuations of progress in design which, bridging over a mediæval chasm, connect ancient classical art with its revival under the great masters of the fifteenth century in Italy, and their disciples, to the present day. Having, in two addresses delivered before this Institute, one in 1847, and the other in 1855, dwelt at some length, although incidentally, on the position of pictorial mosaic in art history, I may trust to your indulgence for treating in general terms only, this really most interesting aspect of our evening's theme.

Having thus noted what I desire to eliminate, let me briefly define the point of view from which I would fain engage you to look with me at the whole matter this evening. That point of view is simply the one from which we may best realise what architects have to learn and to do in order to effect a practical revival of the art in the present day. In describing, in one of the addresses already alluded to, some of the mechanical operations of the ancient mosaic worker, I repeated in the year 1855 what I had first advanced in 1847—viz., that I saw no reason whatever why we should not carry out in the various processes of mosaic "exactly what the Greeks and Latins practised of old." If I was justified in that remark then I am more than justified now, for, as I shall hope to presently convince you, many practical difficulties formerly existing have been removed, and convictions as to the eligibility of the revival entertained by a few then are now heartily sympathised with by many, able, not to dream and desire only, but to work and to do. So strongly, indeed, is the current now setting in that I feel convinced it will be ere long incumbent on every architect practising in the higher walks of the profession to make himself acquainted with the best mode of dealing with what, when once adopted, will, I do not doubt, become the most popular means of adding the graces of colour to the refinements of form and proportion. Mural painting must in our climate ever have to contend with elements certain to shorten its ephemeral beauty. If attempted in real fresco, damp, fog, and frost speedily fasten upon its very vitals, tending to set the lime against the oxides and other pigments which in time are eaten away, as even in Italy we frequently see them, into nothingness. Fresco secco is still less permanent. Tempera, or distemper, I need not waste a word upon. Oil or encaustic painting involves the use of vehicles darkening, turning yellow, shrinking irregularly, and ultimately often detaching themselves from the ground to which they are applied. What, then, is left to us, if we would have our decorations live after we have ceased to live, but those processes, over the most delicate and the boldest pictures produced by which, experience has proved that a thousand years may pass "and steal no grace away."

I purpose now, in the first place, putting before you, in a summary form, the nature of such experience derived from the past, and, in the second, glancing at the various scopes and difficulties, of the art in its production and application.

The main historical phases of pictorial mosaic were the following seven:—1st, Classical. 2nd, Latin. 3rd, Byzantine. 4th, Greco-Italian. 5th, Italian Monumental. 6th, Italian Portable. 7th, Mosaic in *pavé* dure.

The first, or *Classical*, is, no doubt, well known to all present in its general aspect, but, as the foundation of all the other styles, it demands a somewhat closer view; the more especially, I think, because this closer view may enable the architect to realise some distinctive features in ancient decoration, revealed to us through no branch of art more distinctly than through mosaic. These features I essayed to deduce from ancient illuminated manuscripts in a paper read in this room in June, 1859; but they may be better recognised in the various remains of Classical mosaic. In the Roman decoration of imperial times two distinct schools may be traced, the one most ancient founded on Egyptian, Dorian, and Etruscan models, chiefly affecting monochrome combinations of black and red or buff, or delicately coloured subjects and ornaments on uniformly flat grounds; and the other rejoicing in the glowing tints and golden and spangled grounds of the East, popularised after the fashions of Ionian, Corinthian, Phœnician, and Syrian magnificence had given that taste for gorgeous costume which led to the substitution of the Babylonian embroidery and figured tissues in costume, and wall hangings, for the simpler stuffs in vogue in during the republican ages. Whether the art of fabricating

gold ground mosaic was of Oriental discovery, or whether, as is more likely, it was derived from the north of Africa—the nursery of the glass and enamel trade—are as yet unsettled points; but that it was freely adopted in imperial times is proved by the various specimens still existing at Pompeii and Naples. It is certainly curious to remark how devoted the ancients were to tessellation as a system, whether in their finest or coarsest examples. Large surfaces of uniform colour were invariably made up of small cubes, little varying in size in any portion of the work. No special labour is bestowed on fine joints, and no effort is made to disguise their effect by using coloured cement stoppings. The jointing was evidently accepted as an artistic convention, and with good taste and judgment it was kept regular, so as to prevent distracting the eye from the pictured forms; its lines were invariably made to subserve by contrast the effect of the flowing contours wrought upon it, and no effort was made by the use of large slabs, combined with tesserae, to save the labour or expense consequent on reducing the whole to one uniform gauge of size or rectangularity. This reduction of all to a common modulus is one of the sources of that appearance of flatness and repose which peculiarly marks all well designed pictorial mosaic. Such regularity is infinitely more important than fineness of works. The best specimens of the value of this adherence to gauge over large plain surfaces with which I am acquainted, are those noble black and white pavements, and wall and vault linings, which abounded in the Baths of Caracalla, at Rome. To those of my hearers familiar with such mosaics as those of the Battle of Issus, at Pompeii, of Pliny's Doves, in the Museum of the Capitol at Rome, of the fine pavement found amidst the ruins of Hadrian's Villa, at Tivoli, now in the Hall of the Masks in the Vatican; of the splendid arabesques and head of Minerva, brought from the site of Cicero's Villa, at Tusculum, and now in the Hall of the Greek Cross; it is needless to state that in all that constitutes perfection in graphic imitation, the fine *opus vermiculatum* of the ancients left nothing to be desired. Not only was form represented by light and shade, and local colour expressed by positive colour, but the utmost refinement of gradation in shadow tints and reflected lights was accurately copied from nature.

Even in that curious mosaic removed from the Temple of Fortune to the Barberini Palace, at the ancient Praeneste, now Palestrina, in which the learned have recognised the identical primitive specimen referred to by Pliny, in the words "*lithostrata caplaverna sub Sella arvali quod in Fortune delubro Praeneste fecit*," a great variety of colouring, and much minute execution in the animals, figures, and landscape are to be observed. For the production of such vivid and varied tints, natural self-coloured materials, such as marbles, stones, &c., could not suffice; and the skill of the glass-workers was, therefore, pressed into the service to enrich the mosaic worker's palette. For him not only were vitreous pastes prepared, glowing with every colour of the rainbow, but chemical processes for staining and tinting natural materials were brought into use; and finally, the vitreous pastes were overlaid with gold, covered in its turn by a thin film of pure white glass, which effectually secured the metal surface from contact with noxious gases or damp vapours. Not content with applying his incrustation to plane surfaces, the mosaic worker learnt also to adapt it to the varied forms of basso relievo. In this country, among the Pembroke marbles, at Wilton, we possess one of the few specimens known of this curious mosaic, which was at once sculpture and painting. Nor is it in such exceptional productions only that we are rich, since, in the more ordinary kinds of pictorial mosaic in which figure subjects are combined with flowing and conventional ornament, the soil of this country has teemed with valuable relics of the Roman occupation of our island. Of these, from my own portfolios, and through the kindness of many friends (Mr. George Maw being the one to whom I am most indebted), I am enabled to present for your notice this evening a very fair assemblage of representations. Among them let me direct your special attention to the following:—The magnificent head of Ceres, from Cornium (Circencester); the subject of Orpheus, from Winterton, near Lincoln; the Bacchus, at Thruxton, Hants; the scenes of the circus from Horkeston on Humber, Lincs; the head, full size, showing the tessellation, from Bignor, Sussex; the fine Bacchus from Stonesfield, near Warwick; the grand pavement from Littlecot, Wilts; and the Bacchus found on the site of the East India House, Leadenhall-street, now in the Indian Museum. The most remarkable specimens of Roman work brought to this country from other lands are, a few small pieces in the Temple collection, and the noble fragments of an extensive pavement, found at Carthage, by Mr. Davis, and now in the British Museum. In addition to the Italian examples, most of which have been engraved, many specimens exist in other countries. Among the best of these I would note the great pavement at Constantine, in Algeria; these found near Lyons, published by M. Artaud, and the Spanish varieties at Italica and Relves. I have dwelt on Classical mosaic at a greater length than I purpose doing upon any other species, because the careful student will find, I think, that evidence exists that every kind of technical process or artistic convention, applied at any subsequent period to the art, was known to and practised by the ancients.

The second variety of pictorial mosaic may be designated as *Latin*, since it long retained the marked peculiarities of style which distinguish Latin from Byzantine art. Thus, not in the choice of subjects only, but in the retention of the ruddy flesh tints, the deep brown shadows, and the stumpy figures and simple costumes of the decline of Roman painting, do such mosaics as those of the fifth century, at Santa Sabina, Santa Maria Maggiore, and San Paolo fuori delle mura, at Rome, differ from later specimens executed in the same city; if not by Greeks alone, at least by a preponderance of Greeks over the direct descendants of the original Classical mosaicists. M. Barbet de Jonny, of the Louvre, who has profoundly studied the subject, remarks that "the mosaics executed from the time of Constantine to the pontificate of Nicholas I., (A.D. 858) do not possess the Byzantine character." This, though partially correct, is far too sweeping an assertion; it suffices, however, to show that the separation in classification of Latin from Byzantine style in mosaics is essential to preserve a correct idea of real, not fanciful distinctions. The earliest Christian Latin mosaic known is that which lines the vaulting of the little baptistery of Santa Costanza, adjoining the Basilica of St. Agnese; and dated from the age of Constantine. It would be extremely difficult to say which was the latest.

The more closely the matter is studied, the more evident it becomes that a distinct Latin influence in the history of art is to be traced, running beside, mingling with, but never altogether losing its identity in, the great tide of progress which swept from a thousand springs and sources over the whole continent of Mediæval Europe. Thus, amongst existing remains of the middle ages we may point to three in particular, in which many of the Latin peculiarities of mosaic working have been faithfully preserved to a comparatively late date—one in the north of Italy, and the other two in that district over which we may frequently recognise traces of the influence exercised by the long flourishing Latin schools of Aix-la-Chapelle and Cologne. In the pavement of the Cathedral at Novara, a work executed at intervals probably between the beginning of the twelfth and the middle of the thirteenth centuries, we meet with a very fair reproduction of a black and white Classical pavement. In various medallions are birds and allegorical figures, of one of which I produce a fac-simile traced by Mr. George Maw from the original. From this may be readily observed the coincidence which occurs between the tessellation of the Novara pavement and that of the ancient pavements of Pompeii, such as I have sought to reproduce in the Crystal Palace, at Sydenham. It is probable that a somewhat similar mosaic pavement, with figures representing Rhetoric, Logic, Prudence, &c., and a Zodiac, was formerly in the church of St. Irene, at Lyons; a city in the neighbourhood of which many fine Classical mosaics existed, which might have well served as models for this mediæval specimen of tessellation.

In the year 1831 extensive excavations, fully described in the work of M. Wallez, were commenced to uncover the crypt and choir of one of the ancient churches of St. Bertin, at St. Omer. These had bare one of the most interesting monuments of art ever exhumed in France. A reference to the engravings taken from M. Wallez's learned work will show at once the nature of the pavement, which represented, by a regular classical tessellation of black, red, yellow, and bluish grey, executed in terra-cotta, stone, granite, and marble, the Zodiac surrounding a square, divided diagonally by conventional ornament, and containing three medallions and a monumental slab in the several triangles so spaced out. Of these the most interesting is the monumental slab, which is covered by a figure of William, son of Robert Count of Flanders. Time does not permit of my dwelling in detail upon the workmanship of the medallions, which show a curious transition from the mosaic to the purely incised slab pavements; but I may be permitted to congratulate France and its archæologists upon the fact that the date of 1108, wrought round the supine figure of Prince William, leaves no doubt as to the retention at that period of

* Read by Mr. M. DEBY WYATT, V.P., at the Royal Institute of British Architects, on the 17th of March.

workmen perfectly capable of imitating in mosaic the important fragments of classical mosaic which served, so far as processes of manufacture, and ornament, are concerned, as models for the execution of this precious work. The third rare specimen of mediæval Latin mosaic is the monumental slab of Frumaldus, Bishop of Arras, found in the Cathedral of St. Waast, at Arras, in 1835, and now preserved in the museum of that city. Frumaldus, who died in 1183, is represented standing and in full episcopal costume. The details are worked out, as you may observe by an inspection of the elaborate coloured plate given in Gallabaud's "Architecture et les Arts qui en dépendent," in tesserae, among which are many obviously gilt. One peculiarly classical feature, the retention of which would go far to prove a Latin rather than a Byzantine tradition for this work, is to be noticed in the strong black outlining of the figure. I am not aware of the existence of any inter Latin tessellation than is shown in these three examples.

We come now to our third species—Byzantine mosaic—which includes all that was done in Greece and Asia Minor, and much that was done in Italy, from the transfer of the seat of empire in the year 329 until the Italians began to learn from the Greeks to practise the art for themselves. History tells us that Constantine took artificers to Constantinople with him skilled in all the arts of Rome, and hence we naturally find that the earliest Byzantine monuments can scarcely be distinguished from the Classical; but the new soil and the old soil soon caused the same parent stock to bear very different fruits—Byzantium rose as Rome sank. No doubt a freer intercourse with the nations of the East, and more especially with Persia, soon led the Greeks to engrave enhanced brilliancy on their fading recollections of classical art; and gorgeousness in costume, in textile fabrics, in illuminated manuscripts, and in pictorial mosaic, soon usurped the foremost place, once assigned to severer sources of beautiful effect. To the pages of Hooper, Lord Lindsay, Gally Knight, Von Quast, Salzenberg, and Ciampini, I must refer my hearers for detailed information upon the productions of the Byzantine mosaic workers, contenting myself with noting that it is in their earliest labours at Santa Sofia, at Constantinople, and in the churches of San Nazaro e Celso (the tomb of Galla Placidia), San Vitale, and the two churches of San Apollinare di Fuori, and di Dentro, at Ravenna, that the finest models for our imitation are to be met with. Byzantine pictorial mosaic is exclusively upon gold ground, and there is ample evidence that from the date of the commencement of the iconoclastic troubles in 742, when multitudes of Greek artists and monks were driven out by persecution to seek a precarious living in foreign countries, the staple of such work was invariably executed, and the necessary materials probably manufactured by these itinerant mosaicists. What are to be peculiarly admired in the Byzantine interiors are the breadth of decorative effect invariably aimed at; the good proportioning of the scale of the pictures and ornaments to the distance from which they require to be viewed; the judicious use of bands, margins, and string courses, to keep their compositions distinct and make them subservient to an architectonic disposition; and the judgment with which they invariably accentuate or emphasise leading architectural features. For instance, nothing can be happier than the mode in which they almost always treated the soffits and faces of arches, and the arcades or salient angles of vaults. Many of these may be seen in the sketches now submitted, the whole of which were executed by me from the original models. No arrangements for decorative form can be happier than such as exist in some of the cupolas of St. Mark's, at Venice, of which I offer to your notice, after the conclusion of my paper, some careful sections taken from Krutz's elaborate work.

Next to Constantinople and Ravenna, Rome certainly offers the noblest specimens of Greek work, done probably to a great extent through the "Scuola Greca" established by Pope Adrian I., A.D. 782, and attached to the church of Santa Maria in Cosmedino. As if to reward the patronage of the Pontiff, the great mosaic of Santa Pudenziana, done in his days, is by far the best in which the Greeks appear to have played the leading part. The mosaics executed at Rome for the next three centuries, although numerous and on a grand scale, exhibit—with the exception, perhaps, of those of Santa Prassede—a marked falling off. In those of the apse of San Clemente, carried out early in the thirteenth century, a decided revival is manifested, but destined to burn brightly for a short time only, being, as it were, almost the last burning up of the already waning flame, which had for so many centuries shed a brilliant light from the capital of the Eastern empire far and wide over the Continent of Europe.

We now come to the fourth or Greco-Italian series, which are important on two accounts—firstly, because they illustrate a gradual emancipation from tradition in the limitation of subjects and action; and, secondly, because they constitute the transition, which ended in the transfer of the art, from one nationality peculiarly fitted to maintain technical efficiency, to another not less qualified to graft pictorial excellence on mechanical precision and perfection. The first mosaics executed in Sicily—those of the church of the Admiral, and of the Capella Palatina—bear Greek inscriptions, and were wrought by Greeks in the first exclusively, and in the second, probably, under the guidance, as to design, of Saracenic artists.

For the later and far more extensive works at Monreale and Cefalù, the mixed races, protected under the Norman dominion, each contributed their quota of skill. The Duca di Serradifalco and Ciccognara agree in recognising the influence exerted on Pisa by the advance made in Sicily; and through Pisa, Sienna, and Florence, were ultimately unquestionably stimulated to rapid advance in art. The cathedral at Monreale, a beautiful drawing of the interior of which, by the late Herr Zanth, was bequeathed by him to this Institute, offers, I believe, next to Santa Sofia, at Constantinople, and St. Mark's, at Venice, the noblest and grandest instance of a church decorated throughout with mosaic. Having worked hard in it for many a day from dawn to sunset, I can bear a humble testimony to its invariable beauty under every changing condition of light and shade. Whether bathed in sunshine and all alive with glowing colour, or almost dark, at closing day, retaining to the last some lingering gleam upon its gilded wall-faces, its aspect is one not of gaudiness nor gloom, but of serene and dignified magnificence. As in Sicily, so in Venice, the art was at first kept entirely in the hands of Greeks, who not only worked at St. Mark's, but at Torcello and Murano as well. In the latter island they no doubt laid the foundation of the glass trade, previously a Constantinopolitan monopoly, so far as the more difficult branches of the manufacture were concerned. From the Murano glass-houses, from the Scuola Greca, at Rome, and from a manufactory established at Palermo, as well as by direct importation from Greece, the materials were supplied with which the Greco-Italian mosaics were executed. The profits made by the itinerant Greeks in Italy, coupled with an increased demand for works of decoration, consequent on the wealth accumulated by the Northern Republics through trade gains, soon caused an attempt to be made by the Italians to break up the Byzantine monopoly.

The success of this attempt led to the development of the fifth species of pictorial mosaic, which I have designated *Italian Monumental*. It was in Florence, early in the thirteenth century, that the transfer of the monopoly was consummated. Andrea Tafi, a Florentine, having insinuated himself into the confidence of certain Greeks working on St. Mark's, at Venice, prevailed at last, as Vasari says, "*con preghi condottuari, e con promesse*," on a certain Apollonius to go to Florence and work with him upon the mosaics which still line the vault of the Baptistery in that city. A rival of Andrea's was the even more celebrated Mino da Turrita, who, having gained an earlier, although probably less accurate knowledge of the Greek processes, preceded Andrea in working on the Baptistery. Subsequently, Gaddo Gaddi was employed as an assistant on these works; and by these artists, and by their pupils, and pupils' pupils, almost all the pictorial mosaics subsequently executed in Italy were carried out. Among such may be specially noticed, as combining fine execution and decorative colour with really good art, the splendid aerie lining of San Giovanni Laterano, and Santa Maria Maggiore, at Rome, executed by Mino da Turrita and Gaddo Gaddi, by the latter of whom Giotto's celebrated "Navicella," at St. Peter's, was also wrought.

So highly did the Italians esteem the products of Andrea's combined talent and cunning that after his death they honoured him with the following epitaph:—

"Qui giace Andrea, ch'opre leggiadre e belle
Fecè in tutta Toscana, ed ora è ito
A far vago lo regno delle stelle."

Pietro Cavallini and the Cosmati subsequently obtained reputation by their mosaic, principally at Rome; the latter working in the Gothic manner altogether. I have every reason to believe that the Greeks continued to labour at Venice long after their services were dispensed with in other cities of Italy; although after 1400, I think the work at St. Mark's to have been altogether Italian. With the uprising of the great school of fresco painting, the employment of mosaic, a far more costly decoration, was, to a great extent, dispensed with; although at Pisa, Orvieto, Sienna, and Rome, both styles of mural cul-

bellishment are constantly to be seen together. Their union is not, however, to be admired, owing to their unequal durability, the permanence of the colour of the one frequently making needlessly conspicuous the fading or staining of the other. The best early Renaissance monumental mosaics with which I am acquainted, are those from the designs of Raffaele in the Capella Chigiana, in Santa Maria del Popolo (illustrated in colour by Mr. Gruner), and the vault of a subterranean chapel in Santa Croce, in Jerusalem, at Rome, the design of which is attributed to Baldassare Peruzzi. The best late Renaissance mosaics, on a grand scale, are unquestionably the magnificent decorations of the vast cupola and pendentives of St. Peter's, models which one would fain see rivalled, not slavishly imitated, in our great metropolitan cathedral. For the production of the Papal mosaics, a *fabrica* or Government establishment was founded, which has not failed up to the present time in providing materials and labourers equal to the repair of old, and the initiation of new work equal in all respects to, and surpassing in some, the peculiarities of each style we have hitherto noticed.*

THE EMBANKMENT OF THE THAMES.

ON Wednesday, in the House of Commons, Mr. COWPER, in moving for leave to bring in a Bill for embanking the north side of the Thames from Westminster-bridge, and for making new streets in and near thereto, and from Blackfriars-bridge to the Mansion House,* referring to past proceedings, said that one of the most pressing wants of the metropolis was a good thoroughfare between the City and the West-end. Ludgate-hill, Fleet-street, and Temple-bar did not now serve the purpose for which they were intended; and, in consequence of the value of property in those thoroughfares, to widen them would almost be impracticable. The embankment that he proposed would also provide for the laying down of a low-level sewer, without the necessity of breaking up the pavement of the Strand and Fleet-street, to the danger of the houses and public buildings. A third object might be combined with these two, namely, the improvement of the navigation of the Thames; and a fourth, the embellishment of the river, and the establishment of a healthy place of recreation for the people residing on the north bank of the river. One of the noblest features of London, and the source of its wealth, was its river, and it might be supposed that Londoners would be proud of it, and have done all in their power to improve and adorn it. The Liffey, which could not be compared to the Thames in size, had been adorned with beautiful quays. Paris, St. Petersburg, Stockholm, Florence, and other Continental cities had done the same for the rivers on which they were situated; but in London little had been done, though he believed the discussion had lasted for nearly two hundred years. Sir Christopher Wren, in 1666, having proposed that a quay should be constructed from London-bridge to the Temple, and similar projects having been repeatedly revived. In 1860 the subject was again renewed in that House, and a Committee was appointed to inquire into the subject. They recommended an embankment between Blackfriars and Westminster, and suggested the coal duties as the source from which the expenses should be defrayed; but they did not recommend a plan. Last year a Royal Commission sat, which not only recommended an embankment generally, but the specific plan to which the Bill he desired to introduce was intended to give effect, and which he had no doubt was the best plan that could be devised. Its main advantage was, that it did not attempt to retain the wharves, as had been intended in all earlier plans; but it was proposed to buy up all the wharves, and make a solid embankment with an ordinary roadway. Another feature would be the extension of the roadway from Blackfriars-bridge to the Mansion-house, as a mere embankment to Blackfriars-bridge would not divert the traffic which impeded the thoroughfares he had mentioned. It was at first proposed that the embankment itself should proceed further than Blackfriars, but the river was so narrow between Blackfriars-bridge and Southwark that such an embankment would be injurious to the navigation, and the property between Southwark-bridge and the Mansion-house was so valuable that the expense would not be compensated by the advantage. The funds from which the work was to be executed were those provided by the London Coal and Wine Duties Continuance Act, passed last session. He proposed that the execution of the Act should be entrusted to the Metropolitan Board of Works. He knew that objections had been urged against this; but it seemed to him that the Board had been created by the Legislature expressly for this sort of work, and that there was no other body in existence to whom it could be more properly committed. It had been objected that the Board were too much occupied. The Bill, however, provided that the executive work should not devolve upon the whole Board, but upon a committee of nine to be appointed by themselves. It had been suggested that the embankment should extend as far as Battersea or Vauxhall. After the execution of the present bill, there would only remain the small portion of the river between Westminster-bridge and Millbank-street, which would be without an embankment. They might, therefore, reasonably hope that this small portion would, in a few years, be embanked, and there would be a clear field extending from Blackfriars-bridge for a distance of four miles. He thought this would be as splendid and magnificent a range as was to be found anywhere. It was not proposed at present to do anything with regard to the south side of the river. A commission was sitting on the subject. They had been hearing a great deal of evidence, but had not yet agreed to their report. It would therefore be premature to form an opinion as to what ought to be done. Among the advantages which would be gained by the embankment would be the throwing open to the public of considerable open spaces of grass and trees by the side of the river. When the sewage was completely removed from the river these places would become spots where enjoyment and healthy recreation could be obtained. Altogether the improvement to the metropolis would be very great. It was proposed not to fetter the Metropolitan Board of Works with any control or interference beyond that which arose from the fact that the funds derived from the coal duties was at present in the hands of the Treasury. The Bill would enable the Treasury to pay the money over to the Board of Works.

Mr. WILLIAMS was sorry to hear that the right hon. gentleman did not propose by his Bill to embank the south side of the Thames, and hoped that a provision to effect that object would be introduced into the Bill; and Mr. LOCKE urged the propriety of due consideration being given to the effect which the embankment of the north side of the Thames must have on the south side of the river.

Mr. COX called attention to the injury which would be inflicted upon persons occupying premises and engaged in trade along the river side by the proposed embankment. Those persons must remove to a distance, and have carts and waggons running from their yards to the side of the river. The new road which

* To be continued.

it was proposed to make in continuation of the embankment would be of no use, and would cost a great deal of money. He was exceedingly anxious to see great improvements carried out in the metropolis, but he thought that the proposed one, instead of being an improvement would become a nuisance. That was his opinion of it as regarded the southern side of the Thames; Mr. CONINGHAM could not conceive a greater metropolitan improvement than the one now proposed, and he should give the right hon. gentleman his support in carrying this measure.

Mr. KINNAIRD also believed that the proposed embankment would be most useful and beneficial, and thanked the First Commissioner of Works for the attention he had given to the subject.

Leave was then given.

THE MANAGEMENT OF OUR SCIENCE AND ART INSTITUTIONS.

IN the House of Commons, on Wednesday, Lord H. Lennox moved that the House is of opinion that, for the preparation of any estimates, and for the expenditure of any moneys voted in aid of the British Museum, the National Gallery, and all other institutions having for their object the promotion of education, science, and art, one Minister of the Crown should be responsible to the House, pointing out, in a long and interesting speech, the anomalous position in which each of these institutions was placed as regarded their government and their representation in the House. The motion was seconded by Mr. Gregory, who dwelt on the irregularity, the want of system, and the absence of responsibility in reference to the conduct of our public works, and expressed his belief that the present motion would be the foundation of an improvement in the management and administration of those institutions, for the consideration of which he pointed out that the present session afforded a favourable opportunity. He especially dwelt on the mismanagement of the British Museum, and urged alteration in its administration.

The Chancellor of the Exchequer said that a new arrangement was made in 1860 with regard to the National Gallery, which it was open to the House to have questioned at the time. As regarded what he might call the indictment which had been laid against the British Museum, he denied that the charge of general mismanagement was sustained by evidence. He contended that the mere fact of that institution being represented in Parliament by a private member of the House did not detract from the responsibility of the preparation and production of the estimates relating to it, while the Government was also responsible for them. He stated that shortly a proposition would be laid before the House relating to the British Museum, which would bring that institution under discussion and enable the House to decide upon that which was proposed.

Mr. Coningham asserted that on all occasions the House had had the control of the expenditure of these public institutions, and had by its acceptance of the estimates confirmed the authority of their administrators; and Mr. Blake complained of the attempt which had been made to make schools of art or design self-supporting, contrary to the usual practice with regard to other branches of public education.

Mr. Disraeli said that while approving of the resolution, which was calculated to do good, he thought it would be desirable not to press the motion to a division. As it had been met by the previous question on the part of the Government, that was equivalent to an admission of the truth of the principle contained in it, and with that he thought his noble friend might be satisfied, as he had practically established his proposition that the management of these institutions generally was not satisfactory. While admitting that such institutions as the National Portrait Gallery and the National Gallery might well be placed under the control of a responsible minister, he thought that scant justice had been done to their present administrators. As regarded the British Museum, although its administration was somewhat anomalous, yet he did not consider it so faulty in action as had been asserted, and the unsatisfactory state of the Museum was inseparable from its origin and multifarious character.

Eventually the motion was withdrawn.

THE SUEZ CANAL.—A letter from Cairo says:—"M. de Lesseps, President-Director of the Suez Canal Company, gave a grand banquet on the 2nd ult. to all the officials and workmen, native and others, in commemoration of the opening of the canal by which the waters of the Nile had been brought into the centre of the Isthmus. Three days before, M. Lesseps left Cairo, descended the Nile as far as Bannah, and after passing through the Canal of Ouadée, entered the new canal, and landed on the plateau close to the town of Tynsah. The journey from Cairo was performed in forty hours, and by means of this new canal navigation is now open from the Nile to the centre of the Isthmus. The number of persons assembled at the banquet was about 200, the place chosen being the banks of the Lake of Tynsah, where large tents were erected for the occasion. At the dessert, M. de Lesseps addressed the company, pointing out the advantages which would result from the completion of this canal, and the greater benefits which would hereafter be produced by that across the Isthmus." The reports current respecting the operations of the Suez Canal Company become more and more unfavourable. The small channel, or *rigote de service*, dug through Lake Menzaleh, is already almost entirely obliterated. Whatever embankments had been raised on either side have been washed away, and the small boats that occasionally attempt the passage find themselves every now and then stuck fast in the open but shallow lake. The approaches to Port Said are in as unpromising a state as ever, and the cutting through the sand heights of El Gier, it is found, must be attempted, in spite of its acknowledged difficulties and disadvantages; and it is now altogether vain for the projectors of the scheme to talk of English jealousy and animosity.—*Engineer*.

CAST-IRON SLEEPERS FOR RAILWAYS.—A modification has just been introduced into the system of French railways, which there is some probability will shortly be adopted by the principal companies of this country. It has long been proposed to substitute cast-iron sleepers for the wooden ones now almost universally adopted, but this substitution has been hitherto regarded as impracticable, on account of the rupture occasioned by shocks, &c., but a felt packing has been applied which effectually prevents all risk of fracture. Experiments and trials on the Paris and Lyons Railway have proved that after eight months' continued traffic, the system was perfectly successful. The economy resulting from the employment of iron, would be, it is said, from 50 to 60 per cent.

Correspondence.

A NEW FURNACE FOR BOILERS, &c.

SIR,—I desire to record a remarkable circumstance attending the supplying of furnaces with heated air which has been hitherto unnoticed, or at least not made public; it differs from the hot blast for smelting purposes. The heated air is obtained by keeping the ash-pit entirely closed, except when opened for removing ashes; and an arrangement for passing one or more streams of air from the back of a boiler bed through separate passages in the solid brickwork beneath the entire length of the lowest fire flues, from thence into the ash-pit, and through the bars into the furnace. The result derived from this description of furnaces, when applied to heating gas retort beds, may surprise your readers, who would probably suppose that it would occasion increased trouble with clinkers, the great object now being to check their formation by using evaporating pans in the ash-pit, which mode causes clinkers to become very hard, their removal often breaking the brickwork; whereas, by their totally reversing the usual mode, and drawing out the heat absorbed in the solid brickwork, and that radiated from the floor of the furnace, and repassing it through the bars, clinkers are formed of so soft a nature as to be clearable from the bars with a rake. In fact, with one exception, firemen attending on these furnaces have told me they would sooner have charge of two altered furnaces to one of the common kind. I believe when this becomes known and tried it will be generally appreciated.

GEORGE WALCOTT, C.E.

Reviews.

Proceedings of the Liverpool Architectural and Archaeological Society.

THE Liverpool Architectural Society have published the proceedings of the thirteenth session—1860-1861. The volume contains full reports of the papers read, which are of an unusually important character, together with a report of the annual meeting. There is also an index and title-page of the proceedings of the last three sessions, which have been printed in the new and reduced size, and which together now form sufficient matter for a volume of moderate size.

The Council augur favourably with regard to the future well-being of the Society, and feel justified in recommending the question of issuing illustrations with future "proceedings" to careful consideration.

DECISIONS IN THE COURTS.

DISTRICT SURVEYORS' FEES.

Badger v. Bowley Brothers.—*Greenwich Police Court.*—In this case, heard on the 11th inst., the summons was granted under Sec. 51 of the Metropolitan Building Act, 13 and 19 Vic., cap. 122, for recovery of two fees of £4 11s. 3d. each, claimed by complainant as district surveyor, in respect of alterations and works done by defendants at the Longton Hotel, Sydenham, in April and May, 1861, under the superintendence of Mr. J. W. Dennison, architect.

Mr. Venn, solicitor, of New-Inn, Strand, appeared for defendants, who denied their liability to pay the second fee in complainant's account, which was claimed "for alterations to roof of building by permission of Board of Works."

Complainant stated that on the 4th of April he found defendants engaged on the works (which had been commenced without any notice to him), and that at this date the roof above some stabling had been covered with an external covering of asphalt, to which he objected, as being combustible: that the architect applied to the Metropolitan Board of Works, who eventually gave their consent to the roof being temporarily left in that state; that defendants, on the 17th of April, gave him a notice applying to the chief portions of the entire work, which was in progress, and offered to pay his fee—but complainant claimed an additional fee for the alteration to the roof discovered on April the 4th, upon the ground that it was a separate matter, and was under his supervision as district surveyor.

Mr. Venn, for defendants, contended that, as asphalt was used in the former covering of the roof, the covering placed by defendants was not in itself an "alteration" within the meaning of Sec. 9 of the Statute, but was "a necessary repair not affecting the construction," and for this a notice would not be required, and that, even if held to be an alteration, it merely formed part of one set of works in progress at the same time, without any suspension, and that therefore only one fee was payable; further, that if defendants had acted illegally by placing the covering on the roof before giving their notice, the district surveyor should have taken steps to enforce the penalty imposed by the Statute, but could not recover double fees.

Evidence being given by defendants that the covering to the roof was a part of the entire work entered upon, and which had been continuously performed without any suspension, the magistrate, upon this ground, decided that only one fee was payable, but declined to express any opinion as to whether the covering to the roof was or was not in itself an "alteration" within the meaning of the Statute.

PRESERVING TIMBER.—M. de Lapparent has addressed a report to the Minister of Marine on the preservation of timber employed in the construction of ships, and proposes a remedy, which consists in the carbonisation of the timber used in shipbuilding. The manner in which he proceeds to carbonise the timbers and the secret which he retains, is by employing "an inflammable gas," which is applied to the timber in a certain manner. It is said that the experiment made at Cherbourg in presence of M. Sochet, director of naval constructions, was completely successful. One essential advantage of the plan is the absence of all danger, which is a chief point in an arsenal. It is estimated that the expense will not exceed 10c. the square yard—gas and labour included. It has been further ascertained that one workman can easily carbonise 40 square yards during a day's work of 10 hours. Finally, the carbonisation is uniform, and it does not exceed a quarter of a millimeter in thickness.

BROMPTON-ROAD IMPROVEMENT.—A circular letter has been addressed to the inhabitants of Brompton and South Kensington, stating that the Turnpike-road Commissioners propose, at their own expense, to widen the Brompton-road, from Knightsbridge-green (close to Sloane-street) to the Bell and Horns (near the South Kensington Museum). The Kensington Vestry undertake to widen the footpaths abutting on the improved road. The Turnpike Commissioners attach to their proposal the condition that the land required for the widening of the road should be delivered to them free of cost. The greater part of the land required consists of small plots of waste ground, abutting on the road; but the value of this, it is conceived, will be more than compensated by the great additional value to be given to all the adjoining property by the improvement of the foot and carriage way. To complete the work, however, some buildings must be removed, and to the owners of those buildings compensation must be made. The Committee, therefore, appeal for a subscription by the inhabitants of Brompton and South Kensington to make up the sum required to put the Commissioners in a position to carry out the improvements.

IMPROVEMENTS IN BUILDING, &c.

EXTINGUISHING OF FIRES IN WAREHOUSES AND OTHER BUILDINGS.—Dated August 3, 1861.—E. Tomlinson and G. W. C. Wilson, Liverpool.

To apply this invention to, say a warehouse, the inventors connect to an underground high-pressure water main, or to an elevated reservoir, a supply pipe which is carried to the side of the warehouse, and, say about 3 feet or 4 feet above the level of the parapet, where it opens into a recess formed in the side of the warehouse, and which may be fitted with a lock-up door. A suitable length of pipe is placed horizontally upon the head of the vertical pipe (forming a T-shaped head), and to which distinct branch pipes leading to each room or floor are connected. These branch pipes are fitted within the lock-up box with suitable stop cocks and handles, numbered correspondingly with the rooms above, and which, upon the discovery of fire in any of the rooms, may be turned on by, say the policeman on duty, who is supplied with a key to the lock-up box. The pipes may be placed in any convenient position within the rooms, say along the ceiling in rows, or connected together by transverse pipes; these pipes are perforated with a large number of holes in any convenient manner. By these arrangements a large quantity of water may be immediately supplied to any of the rooms either separately or collectively, as required, and these perforated pipes may also be applied to the inside of the roof of the buildings.

WINDOW SASHES.—Dated August 7, 1861.—D. Miles, Newport.

The patentee claims the combination of parts tied or kept together by metallic tongues, forming, when complete, a rigid and secure window sash, and permitting, on the withdrawal of the said metallic tongues, both the upper and lower sashes partially to revolve, in order that either side of the glass may be cleaned from the interior of the room or chamber at pleasure. Also the combination of parts in using which he dispenses partly with the metallic tongues for the lower sash, or for both upper and lower sashes, and uses a spring catch, or two spring catches, in lieu thereof. Also the combination of parts by which he causes both upper and lower sashes to present singly or together either face of the glass to the interior of the chamber, substituting the use of spring catches in lieu of metallic tongues.

COVERING FOR HOUSES, &c.—Dated 7, 1861.—N. A. Lessueur, Paris.

This invention consists, principally, in giving to bricks, tiles, &c., by means of grooves, notches, or mortices cut in dovetail, the faculty of being set and fixed rapidly, solidly, and economically.

THE CONSTRUCTION OF DOORS, GATES, AND SHUTTERS, PRINCIPALLY APPLICABLE TO FIREPROOF BUILDINGS.—Dated August 8, 1861.—W. S. Hogg, Kotherhithe.

This invention consists in forming the above-mentioned articles of parallel iron or other metal bars, related or grooved to receive bricks or other molded forms of earthen materials. In many cases ordinary bricks will answer the purpose perfectly well, and may be variously disposed according to the structure required. The parallel iron bars are combined with an external iron framing of the form and size desired.

PROTECTING AND ARRANGING WATER PIPES, AND MECHANICAL CONTRIVANCES FOR WITHDRAWING THE WATER FROM THE SAME AND PREVENTING THEIR BEING INJURED BY FROST.—Dated August 3, 1861.—G. F. Jones and J. Jones.

This invention relates, first to supply pipes. It being usually inconvenient or impracticable to place these sufficiently deep in the earth to be beyond the influence of frost, the patentees protect the same by coating them with, or embedding them in, some one or other of the substances which are the slowest conductors of heat (such as felt, straw, or hay bands, india-rubber, fine dry sand, or sawdust, clay, salt, or alum), and when required, enclosing these in earthenware or wooden pipes or casings. Just where the protection due to depth ceases, the supply pipe is to terminate in a cylinder placed horizontally or obliquely, having a piston which, when pushed towards and left at the outward limit of its stroke, shall permit the free passage of the water from the supply pipe to the house main, and when drawn to its inward limit, and held so by weight, shall stop and prevent the supply, at the same time permitting the water contained in the house mains and branches to return to the cylinder, and thence to run off by a waste pipe with a drain, which waste, during the admission of the supply, is closed by the periphery of a second piston open longitudinally, travelling simultaneously and commensurately with that first mentioned.

FIRE-PROOF BUILDINGS.—Dated July 25, 1861.—J. Simmons.

In carrying out this invention the inventor proposes to make the cast-iron girders and columns used in supporting the various floors hollow, and to connect them together in such a manner as to form a clear watercourse throughout the whole series. The tubular columns he carries up from the basement to the roof, where he connects them with a water-tank that may cover any given surface of the roof, and these lines of columns he also connects with a series of hollow girders, which serve to carry the several fire-proof floors. He brings down water from the tank to the basement of the building by suitable pipes running either outside the building or enclosed in brickwork, so as to be protected from the action of fire in the building, and at the basement he connects this supply with the vertical columns which carry the hollow girders. By this arrangement, should a fire occur in any part of the building, the adjacent hollow metal supports will become heated, and the water contained therein will be caused to circulate, a heated stream floating upward, and cold water taking its place, and absorbing the heat imparted by the fire to the metal. Thus the temperature of the metal will be effectually kept under, and a discharge of water on to the exterior of the metal will in no way affect its stability.

MACHINERY FOR CUTTING WOOD.—Dated July 23, 1861.—R. Thompson.

This invention consists in an arrangement of machinery whereby revolving cutting tools for chiseling, grooving, moulding, and other similar work, can be moved (while in the operation of cutting or otherwise) in any direction required by the workman, giving him complete command over the tool to follow any line of cut traced out, without in any way interfering with the revolving action of the cutter or the driving power. The principle consists in mounting the cutting tools in a carrier or traverse block, such block being free to travel along a beam, revolving motion being communicated to the cutter by a gut or band in the following manner:—Motion is communicated from the driving power to a double-grooved pulley revolving freely upon a shaft, upon which shaft one end of a beam is pivoted. A second gut or band passes round the other groove of the double pulley, thence entirely round, so as to grip a pulley attached to the cutter holder, thence round a third pulley upon the opposite end of the beam, and back, past, and clear of the cutter-holder pulley to the first pulley. The traverse block or carrier can thus travel along the beam, carrying with it the cutter, without interfering with the revolution of its pulley.

FOR PREVENTING THE WIND DRAUGHTS AT THE FOOT OF DOORS, AND ALLOWING THEM TO OPEN OVER CARPETS OR OTHER SUBSTANCES WITHOUT THE USE OF RISING HINGES.—C. A. Wheeler.

This invention consists of two pieces of moulding the width of the door, made in any kind of wood or metal, the lower or bottom piece being much stouter and heavier than the upper piece, and they are attached to each other by cords or chains, leaving a space between the two pieces of moulding to allow the lower moulding to rise and pass over the carpet, or any other substance the door may have to travel over. The upper piece of moulding is made fast to the face of the door by screws, or nails, or brads, suspending the lower piece of moulding one-eighth of an inch or more from the floor; and in front of these mouldings, between them and the door, is a piece of an air-tight cloth, or india-rubber, or other flexible material the width of the door, which flexible material is attached to the upper piece of moulding, or to the face of the door, and which rests upon the floor. The lower piece of moulding, being suspended in the manner already described, rises and falls with the opening and shutting of the door, and presses against the flexible material, preventing any wind or draught from entering the room.

WATERCLOSET AND URINAL APPARATUS.—N. Common.

Here the inventor uses an air-tight vessel in which water sufficient for one discharge is collected as the water accumulates, air contained in the vessel is compressed, so that when the discharge takes place the water will rush out with a force due to the degree of compression of the confined air.

TENDERS.

DWELLING-HOUSE, ANERLEY.

For erecting a dwelling-house in the Oakfield-road, Anerley. Mr. George Elkington, architect. Quantities supplied by Mr. H. A. C. Herring.

Luscombe	£1,476 10	Keat	£1,277
Downs	1,370 0	Corder	1,265
Barrett	1,297 0	Thompson (accepted)	1,230
Coleman	1,279 0		

MANSTON, OMAGH (IRELAND).

For additions and alterations to Seskanore House, near Omagh. Messrs. Boyd and Batt, architects, Belfast and Londonderry.

Mullin	£2,500	M'Gauchey	£2,100 0 0
Fergusson	2,332	M'Clelland (accepted)	2,074 10 5
Stewart	2,181		

ALTERATIONS, DUBLIN.

For alterations to a house in Grafton-street, Dublin. Mr. Hoane, architect.

Clarke	£350	Grant and Lennon (accepted)	£325
Drysdale	343	Smith	320

POLICE STATION, COVENTRY.

For a new police station at Longford, near Coventry. Mr. William Kendall, county surveyor.

Dutton	£1,330	Fox	£1,164
Robinson	1,297	Hallam and Price	1,125
Marriott	1,240	Potter	1,029
Matthews	1,175	Storer, Junr.	934

BRIDGE, LEICESTER.

For the ironwork and fixing for a cast-iron girder bridge of 42 feet span, average width between parapets, 27 feet 6 inches, for crossing the river Soar, at Leicester. Mr. E. L. Stephens, borough surveyor, engineer. Quantities supplied.

Dunn	£828 0	Haywood	£555 0
Cochrane	765 0	Sharran	445 0
Swingler	705 0	S. Pegg	420 0
Stapp	649 0	J. Pegg and Co.	400 0
Handyside	630 0	Grimsons	398 10
Galloway	600 0	J. and R. Cliff	392 10
Head, Ashby, and Co.	600 0	Law and Sons	360 0

REPAIRS, &c., PICCADILLY.

Repairs and alterations, 3, Little St. James-street, Piccadilly, for J. Dobson, Esq. C. J. Adams, architect.

Clements	£158 8	Williams (accepted)	£131 0
		Architect's estimate	£140

DWELLING-HOUSE, STRATFORD.

For house at Maryland Point, Stratford, for Mr. J. Wood, of Bethnal-green. Mr. S. W. Iron, surveyor. Quantities supplied by Mr. Brett.

Lerko	£360	Rivett	£319
Reed	355	F. and F. J. Wood	297
Markhall	320	* Jay	225

* Letter afterwards received from Mr. Jay, stating his tender should have been £325.

LUNATIC ASYLUM, KENT.

For lunatic asylum at Stone, Kent, for the Corporation of the City of London. Mr. Bunning, architect.

	Portland.	Ancester.
Webster	£45,500	£43,400
Holland and Hannen	44,600	43,000
Ryder	44,200	42,800
Higgs	43,445	42,000
Sewell and Son	43,166	40,106
Trollope	42,800	41,920
Brown and Robinson	42,670	40,820
Corder	42,600	40,400
Lucas Brothers	42,300	41,550
Hill and Co.	41,000	39,038
Myers	40,817	40,150
Axford and Co.	40,140	39,660
Ashby and Horner	39,970	39,500
Perry	39,575	37,575
Wilson	39,425	38,925
Piper and Wheeler	38,464	37,784

DWELLING-HOUSE, BEDFORD.

For the erection of dwelling-house and coffee-rooms in Cauldwell-street, Bedford. Mr. Usher, architect.

Reynolds and Son	£484 0 0	Francis and Son	£378 15 0
John Young	452 12 2	Thomas Preston	371 0 0
John Cunvill	422 0 0	Samuel Joy	339 9 6
James Houghton	405 15 0		

CATTLE MARKET, COLCHESTER.

For the erection of the Colchester new cattle market. Mr. J. S. Cooke, C.E. Quantities by Messrs. R. L. Curtis and Son.

Sawyer	£1,953 0	Lee and Baker	£1,406 10
Parker	1,800 0	Dobson	1,357 16
Rayner and Co.	1,521 0	Orrin and Elsdon	1,348 10
Start	1,513 0	Strickson	1,150 0
Hawkins	1,444 0	Hunt (accepted)	1,140 0

WORKHOUSE, LANCASHIRE.

For works required at the workhouse now in course of construction at Blackburn, Lancashire. Quantities supplied by the architect, John Edward Outes, York and Halifax.

Masonry to Entrance-lodge, and to complete Retaining Wall.

Field and Broughton

Carpenter's and Joiner's Work for Lodge, and Fittings in Workhouse.

R. Bell

G. W. Baron

Steam Boilers, Cooking Apparatus, Hot Water Apparatus, and General Ironwork.

Fryer

Brooke

Clark and Co

Gas Tubing.

Cowburn

J. Metcalfe

John Bell

Masonry and Slating, &c.

A. Neill (accepted)

HOUSES, NEW WANDSWORTH.

For a pair of houses to be built at New Wandsworth, for Thomas Cole, Esq. G. H. Page architect.

Piper and Wheeler

Notley

Westcott

Bass

ALMSHOUSES, LONDON.

For thirteen additional almshouses, and other works, at the Licensed Victuallers' Asylum.			
Haine	£3,300	Wills	£2,897
Allred	3,214	James and Ashton	2,892
J. and C. W. Todd	3,197	Ennor	2,872
Adams and sons	3,181	Greenwood	2,800
Blackburn	3,120	Morter	2,743
Hebb	3,090	Searle	2,473
Martin	2,957	Harrap and Son (accepted)	2,100

CHURCH GALLERIES, &c., TUNBRIDGE WELLS.

For two new galleries, pulpit and reading-desk, &c., in Christ Church, Tunbridge Wells, Mr. W. Bond, architect. Quantities by Charles M. Strange.			
Winnifirth	£583	Perigoe	£182
Messrs. Pink	495	E. J. Strange	426
Edwards and Walsling	490		

CHAPEL, BIRMINGHAM.

For new congregational chapel, Lozells, Birmingham. Poulton and Woodman, architects, Reading.			
Jones	£3,550 0	Barusley	£3,378 0
Partridge	3,450 0	Webb and Sons	3,360 0
Hardwick	3,428 0	Mathews	3,238 0
Wilson	3,390 0	Bennett (accepted)	2,967 0

COMPETITIONS OPEN.

INFIRMARY.

LONDON.—The managers of the Central London District School desire to have designs for a detached infirmary for their boys' and girls' schools at Cuckoo Farm, Hanwell. The building must be of a simple and inexpensive character, in harmony with the existing buildings, and comprise accommodation as required by the Poor Law Board for 180 boys and 180 girls, each sex to be separately distributed in six rooms. There must also be a kitchen, surgery, waiting-room, and other necessary offices underneath. Particulars on application to the superintendent at the schools. The plans must be drawn to a uniform scale of 8 feet to an inch, each to be accompanied by a specification of the works and an estimate of their cost. No premium will be given, but the architect whose plan is chosen will be paid by commission for supervision, &c., of erection of the building in the usual way. Each set of plans must be subscribed with a motto, and forwarded with a sealed letter, containing the motto and the author's name, to Samuel Heath, Jun. clerk to the Board, No. 10, Basinghall-street, E.C., on or before April 2.

LAYING OUT.

TRANSMERE.—The directors of the Transmere Freehold Land Society desire plans, before the 25th March, for laying out and allotting the estate belonging to the Society, in Higher Transmere: consisting of about 40 statute acres. Premiums will be given for the best and second-best plans. Each plan to be accompanied with an estimate of the cost of the formation and construction of the roads and sewers, and also of the laying out of the land. Particulars from Mr. John Quinn, Chairman of the Society, 22, Lord-street, Liverpool; or from Mr. H. P. Priest, Secretary, Market-cross-chambers, 19, Market-street, Birkenhead.

CONTRACTS OPEN.

BANKS.

LIVERPOOL.—For the erection of new premises for the Adelphi Banking Company, in South John-street, Liverpool. Quantities may be had, and the plans, &c., seen at the office of C. O. Ellison, architect, 20, Clayton-square, Liverpool. Tenders to the architect not later than twelve o'clock on the 28th inst. marked "Tender for Adelphi Bank."

BUCKS.—For the erection of new bank premises, at Aylesbury, Bucks, for the directors of the London and County Bank. Tenders to be delivered to Frederick Chancellor, Chelmsford, Esq., on or before the 25th inst.

IRELAND.—For erecting a branch bank and manager's residence at Nenagh, co. Tipperary, for the Provincial Bank of Ireland. Plans, &c., at the office of the architect, W. G. Murray, 68, Lower Gardiner-street, Dublin, up to the 31st inst. on which day estimates are to be forwarded addressed to Thomas Hewat, Esq., Provincial Bank of Ireland, 42, Old Broad-street, London, E.C.

TOWN HALL.

TIVERTON.—For the erection of the New Town-hall, &c., for the Borough of Tiverton. Plans, &c., at the town clerk's office, Peter-street, Tiverton. Sealed tenders endorsed "Tiverton New Town Hall" to be delivered at the town clerk's office, on or before the 2nd of April. Bills of quantities will be supplied by the architect, Mr. H. Lloyd, Park-street, Bristol.

BATH.

RYDE.—For a floating bath, 110 feet long by 55 feet wide, with thirty dressing boxes, waiting room, &c., to be constructed of timber, and moored near the pier at Ryde. Plans, &c., at the office of the Company's engineer, Mr. F. Newman, 16, George-street, Ryde, where sealed tenders are to be delivered before noon on the 31st inst.

CHURCHES.

SUFFOLK.—For the works to be done in additions and alterations to Ousden Church, Suffolk. Drawings, &c., with Mr. J. F. Clark, architect, Newmarket. Tenders to the Rev. W. S. McDonald, Rector, Ousden, on or before the 24th March.

CAMBRIDGE.—For the works to be done in restoring the north wall and roof to nave of Kirtling Church, Cambs. Drawings, &c., at the office of Mr. J. F. Clark, architect, Newmarket. Tenders, sealed and endorsed, "Tender for Church Restoration," to be sent to the Rev. W. Chavasse, Kirtling Vicarage, before the 24th inst.

IRELAND.—For the several works to be done in erecting the intended new Roman Catholic Church at Broadford, co. Kildare, for the Rev. Felix Tracey, P.P. Plans, &c., with John S. Butler, Esq., architect, No. 16, Hume-street, Dublin, to the 31st inst.

SUFFOLK.—For taking down the tower of Foxearth Church, near Sudbury, Suffolk, and building a new tower and spire, together with other works. Plans, &c., at the school-room, on the 24th of March, and five following days. Sealed tenders, directed to Rev. John Forster, Foxearth Rectory, on or before the 6th April.

CHAPELS.

BRISTOL.—For the erection of the Clifton Wesleyan Chapel. Drawings, &c., with Fosters and Wood, architects, 6, Park-street, Bristol, till the 28th inst., on or before which the tenders are to be sent to the architects, sealed and endorsed "Tenders for Clifton Wesleyan Chapel."

EXETER.—For the erection of a chapel adjoining the Training College. Plans, &c., at the office of the architect, Mr. Hayward, to whom tenders, sealed and endorsed, "Tender for Training College Chapel," before ten o'clock a.m. March 7.

SCHOOLS.

SURREY.—For the infant school and house proposed to be built at Farncombe, near Godalming, Surrey. Plans, &c., at the Farncombe National Schools. Tenders to be sent to C. H. Howell, architect, 6, Crescent, New Bridge-street, London, before the 24th March.

DWELLING HOUSES.

STAFFORD.—For additions to premises in the Gaol-square, Stafford, (belonging to Mr. Wm. Wynne.) Plans, &c., with Mr. Henry Ward, architect, Bank-passage, Stafford.

STAFFORDSHIRE.—For the erection of six dwelling-houses at Heron Cross, Fenton, for Mr. Barlow. Drawings, &c., at the office of Charles Lynam, architect, Stoke-upon-Trent, until the 26th inst., on which day tenders are to be delivered to the architect, sealed and enclosed.

STAFFS. X.—For the erection of a dwelling-house, with offices, entrance-lodge, &c., at Staplefield Cuckfield. Plans, &c., on application to Mr. F. W. Holloway, surveyor, Hayward's Heath, till the 25th inst. on which day, at noon, the tenders will be opened.

CAMBRIDGE.—For the erection of a dwelling-house or villa, to be built in March, in Cambridgeshire. Plans, &c., at Mr. Edgar Foster's, at March. Tenders to Mr. Foster, on or before the 31st March.

TWICKENHAM.—For building eight small houses at Twickenham. Drawings, &c., at the office of the architect, Henry McCalla, C.E., 25, Westbourne-place, Eaton-square, to whom tenders by 12 noon March 24.

DUMFRIES.—For building a dwelling-house and offices, at Heads, in Lochrutton. Plans, &c., at Heads. Tenders to W. Beattie, Esq., Newton, on or before March 26.

HANTS.—For the erection of a dwelling-house and offices, at Little Arnwood, in the parish of Hordle, Hants. Plans, &c., with Messrs. Haslam and Buckland, surveyors, 23, Friar-street, Reading, Berks; or at the Farm-house. Tenders to be delivered at 23, Friar-street, Reading, on or before March 27.

ERITH.—For the erection of a villa residence at Erith, in Kent, for Mr. Strickland. Plans, &c., on the 26th inst., with Mr. Gates, 3, Eton-grove, Lee, Kent.

POLICE-STATION.

DEVON.—For the erection of police station, &c., at Northtawton, Devon. Plans, &c., with Henry Ford, Clerk of the Peace, Castle of Exeter, and at the office of Robert Fulford, Esq., clerk to the Justices, Northtawton. Sealed tenders endorsed, "Tender for Northtawton Police Station," to be sent to Mr. Ford on or before the 1st April.

BRIDGE.

MONTGOMERYSHIRE.—For the erection of a plate girder bridge, for Broniarth, Meifod, Montgomeryshire, of 100 feet clear waterway, and 18 feet over all. Plans, and specifications can be seen at the office of the county surveyor, Kerry, Montgomeryshire. Broniarth is about 10 miles from the Llanymynech Station, on the Oswestry and Newtown Railway. Tenders by April 7.

RAILWAYS.

INVERNESS AND PERTH JUNCTION.—The directors are prepared to receive tenders for the construction of two additional sections of the line, viz.:—1. The Dalnacardoch contract, extending from Calvine to the march between the counties of Perth and Inverness, measuring 12 miles 1,383 yards or thereby, and comprising about 40 bridges and culverts for roads and streams, the span of the largest bridge being 60 feet. The excavations consist of about 250,000 cubic yards, including some rock. 2. The Aviemore contract, extending from the river Duluin to a point near Kinrara, measuring about twelve miles 1,140 yards. The excavations on this section are almost wholly gravel, and comprise about 300,000 cubic yards, and the bridges are about 14 in number, the largest being a girder bridge over the river Duluin, of 80 feet span. The rails, chairs, sleepers, spikes, fish-plates, and bolts will be supplied by the Railway Company. Drawings, &c., at the offices of Joseph Mitchell, Esq., C.E., Inverness, from whom, or from the assistant engineer on the line, duplicate schedules may be obtained at £2 2s. each. The cost of the detailed measurements will fall to be paid by the successful contractors. The line is staked out a distance of every 100 feet, according to the working sections. The deepest cuttings are also plotted to ascertain the nature of the materials in the excavations. An assistant engineer will be at Blair Hotel, Blair-Athole, on 1st April at 10 o'clock a.m., to accompany contractors over the Dalnacardoch Contract; and at Lynville, Kinrara, on 3rd of April, at twelve o'clock noon, to accompany contractors over the Aviemore Contract, and point out the works and the sites of the bridges. Draft-contracts proposed to be entered into will be seen with the assistant-engineer, or at Mr. Mitchell's office, on and after the 26th. Sealed tenders, addressed to the secretary, and marked "Tenders for Inverness and Perth Junction Railway Works, 'Dalnacardoch' or 'Aviemore Contract,'" as the case may be, must be lodged at his office on or before the 9th April, at twelve noon.

MILITARY WORKS.

WHITEHAVEN.—For the performance of such of the undermentioned descriptions of work as may be required at Whitehaven and Maryport, in the construction of gun platforms, parapet walls, magazine and artillery store, inclosure-fence, &c., (in the batteries for drill and practice about to be formed there); in the partial levelling and draining of the sites for the batteries; and in the formation of roads. Schedules of prices and printed forms of tender, on or after the 12th March, until the 19th, where plans and specifications of the works may at the same time be seen. Each contractor will be required to tender for all of the trades:—masons', paviors', bricklayers', and plasterers' work; carpenters' work, slaters' work, smiths' and ironfounders' work, plumbers' work, painters' and glaziers' work. Each tender is to be properly filled up and signed, and to be transmitted, under cover, to the Director of Contracts, War Office, Pall-mall, London, S.W., so as to be received there on or before the 25th March next, and to be marked on the outside, "Tender for Works at _____, in the Northern Royal Engineer District."

NORTHERN DISTRICT.—For the performance of such of the undermentioned descriptions of work as may be required at Whitehaven and Maryport, in the construction of gun-platforms, parapet walls, magazine and artillery store, inclosure fence, &c., (in the batteries for drill and practice about to be formed there); in the partial levelling and draining of the sites for the batteries; and in the formation of roads. Schedules of prices and printed forms of tender until the 19th of March, at the Royal Engineer Office, Newcastle-on-Tyne, where plans and specifications of the works may at the same time be seen. Each contractor will be required to tender for all of the trades:—Masons', paviors', bricklayers', and plasterers' work; carpenters' work, slaters' work, smiths' and ironfounders' work, plumbers' work, painters' and glaziers' work. Each tender to be properly filled up and signed, and transmitted under cover to the Director of Contracts, War Office, Pall-mall, London, S.W., on or before the 25th March, and marked on the outside, "Tender for Works at _____, in the Northern Royal Engineer District."

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

W. R. (Portsmouth).—Received: thanks.

B. F. B.—K.—Should be attended to.

C. J. R. W.—A SUBSCRIBER.—G. N. R.—T. S. (Brighton).—Not yet completed, but will be very shortly.

G. O.—We cannot enter into such matters.

S. G. A. (Leeds).—Thanks.

A CONSTANT SUBSCRIBER.—B. R.—Statement was not true; much obliged.

B. O. A. E.—Yes, if suitable; let us see drawings.

Y. N. (Liverpool).—Shall hear from us.

A. L. F.—Perhaps; but we cannot promise.

H. (Dublin).—Send further particulars.

C. A. J.—Shall be engraved.

R. K. J. C.—Parcel has not yet been received.

S. O.—Below our mark.

A SUBSCRIBER (Carlisle).—Yes, of our publisher.

R. E. F. B.—We cannot interfere; you have an obvious remedy.

N. O.—All in good time.

Q. (Salisbury).—Answered at length on another page.

M. J. L.—Review has been some time deferred for want of space; perhaps next week.

F. R. (Cork).—Send papers.

N. J. C. E.—Would be wiser to consult an architect.

M. A. C.—Not at present.

R. O. D. I.—Not suitable.

1.—Next week.

E. S. (Maidstone).—Stands over for consideration.

J. C. and H. K.—No harm has been done at present.

O. E. R.—We have no fear, judging from what has appeared.

A. D. G.—Thanks; too late. Account has already appeared.

** All communications to be addressed, The Editor of the BUILDING NEWS, 20, Old Broad-street, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 15 to 21, Old Broad-street.

Advertisements are received up to six o'clock on Thursdays.

ARCHITECTURAL EXHIBITION.

THE CONVERSAZIONE.

THE *Conversazione* inaugurating the twelfth season of the Architectural Exhibition, took place, as many of our readers are aware, on Tuesday evening last, when, notwithstanding very unfavourable weather, and a little mismanagement in selecting an evening long appropriated by the Architectural Museum, the rooms were for several hours crowded with visitors, among whom the large number of ladies, who by their presence greatly contributed to the success of a most successful gathering, was very notable and gratifying.

Among those present—the number of visitors throughout the evening was mentioned as amounting to nearly 800—were the Marquis d'Azeglio, Budroodeen Tyalgee Sahib, Dr. Samuel Kinns, the Rev. R. Burgess, B.D., D. Brandon, Professor Robert Kerr, Messrs. Mayhew, John Billing, James Wylson, W. Burges, T. M. Rickman, Edward Blatchley, J. W. Penfold, G. Godwin, C. F. Hayward, J. W. Papworth, Randall Druce, E. B. Lamb, T. Roger Smith, R. O. Harris, R. P. Spiers, Thomas Blasbill, G. B. New, T. D. Wyatt, Dollman, Edmeston, Truefitt, &c.

In the course of the evening, Mr. Edmeston, in the absence of Mr. Ashpitel from indisposition, said the Committee were glad again to meet the members and friends of the Institution at another Exhibition, and referred with satisfaction to the fact that the receipts during the last year had been sufficient to meet the necessary expenses of the Exhibition, though they were somewhat augmented in consequence of new regulations being made, one of which was that the Committee determined to pay the carriage of all drawings from country exhibitors, amounting to a good deal of money in the course of the year, and also because exhibitors had free tickets given to them. However, the money received had been sufficient to meet the expenditure, and that was all they wanted. With regard to the present Exhibition, he was able to allude with very great pleasure and satisfaction to the large and interesting collection of drawings and sketches by Mr. Pugin, in the West Gallery. The Committee of the society had always from the first persevered and succeeded in keeping the season tickets at the very low price of half-a-crown, their object being not to make money, but to give facilities to the public to visit their annual exhibitions, and thereby conduce, as far as possible, to the elevation of public taste and the spread of art instruction. The Committee having heard that Mr. Pugin was collecting in all quarters, and from all sources, the drawings and sketches of his late father Mr. Welby Pugin (who was so well known in connection with architecture), for the purpose of exhibiting them in a collected form, it occurred to them that it would not be advisable to have two architectural exhibitions simultaneously, but that it was desirable to have the two collections in one exhibition. Mr. Pugin had already incurred some expense in preparing the collection of his father's designs, and the room for exhibition had been taken; negotiations took place, and it was arranged that the two collections should be exhibited together under the same roof; that the subscribers and season ticket holders of the Architectural Exhibition should have free access to the Pugin Collection, and that non-subscribers and those who did not possess season tickets should pay one shilling for admission to the Pugin Collection, as well as a shilling for admission to the collection of the Architectural Exhibition. He thought that all would see the propriety and advantage of possessing themselves of half-crown season tickets instead of having for a single admission to pay a shilling at one door and a shilling at another. The Society had sent no drawings away to make room for the Pugin Collection. This was the twelfth Architectural Exhibition according to the catalogue; but it was, in reality, the tenth since the present Committee was formed; for ten years the same secretaries, Mr. James Fergusson and himself, had acted in the interest of the institution, and it was with much satisfaction, considering they sprung from so small a beginning, the Committee met the members and friends under such auspicious circumstances. They had established the Exhibition, they had got it a home of its own, and they could all look back with satisfaction at the result, as well as with gratitude to the support of the public. But they ought to see many more names in their catalogue among the leading members of the architectural profession. An architect was not like a painter, who might produce, perhaps, only two pictures in a year; but an architect had many drawings going through his office every year, the exhibition of which would tend to the elevation of public taste, and the teaching of young men who might come to the galleries to study. There was room for reform in this respect. The Committee had hoped that there would have been rather more of that feeling or enthusiasm for art, this year, at a time when London was expected to be full of people from all parts of the world. They had hoped that there would have been more of that feeling than had turned out to be the case. They had reason to see, from various causes, that public taste and knowledge had not reached the pitch it ought to reach, and we lately had an example of the skill and taste among a certain body who had the management of a very important

undertaking. Therefore they ought to do all they could to improve the public taste.

The Rev. R. Burgess, Chairman (who stated that he had been unexpectedly called upon to preside), said, exhibitions seemed to be the order of the day, and this one offered peculiar advantages to the public. Whereas a person would have now to pay two shillings for a single admission to the whole of this Exhibition, he could have a season ticket for half-a-crown; and if the Great Exhibition authorities had afforded similar advantages, they would have sold a great many more season tickets than they had done. These exhibitions tended very much to the promotion of art and science in this country, and had really become schools of instruction for those who were not professionally engaged, but who still wished to correct their tastes and improve their information on such subjects. Looked at from that point of view, they were exceedingly important. This Exhibition was a peculiar one; it was a combination of architects, who contributed architectural drawings. They were a class of themselves, and they had much need to study architecture in this great metropolis when they compared its architecture with that of other capitals. It seemed that, with Parliamentary supplies and votes of money, it was impossible for us to produce what was produced by other countries. He wished more liberality was exhibited in voting money for public buildings, so that they might be an honour to the country. The more they studied civil architecture the more they would insist on the improvement of our metropolis. He was sure they would all feel and sympathise with the fact that one of the patrons of that Institution, as he was the patron of every other that promoted art—his late Royal Highness the Prince Consort—they had lost since they had met together at the last Exhibition. They had lost that great promoter of art and of everything that tended to elevate the tastes of the people of this country. It was a great loss, and it would be difficult to replace that loss. It was, he thought, a want of consideration and almost of respect to the Institution, that so many of our architects whose names were before the world should withhold contributions to the Exhibition.

Professor Kerr said, as to the observations which fell from Mr. Edmeston and the Chairman as to the non-exhibition of drawings by some eminent architects, he hoped no one thought they were speaking in disparagement of the drawings exhibited. All they wanted was to see brought together there from year to year a good average collection of the works of the year, so that they might keep well before the public; they did not wish to impose on the public by any false display, or to give the public an erroneous notion by an inferior display.

Passing through the rooms the display visible upon the walls would occasion some anxiety, if we were not fully aware of the circumstance which has caused it. We were, in fact, agreeably disappointed to find the Exhibition even so good as it is, in the face of the infinitely greater temptation afforded in the galleries of the International building. The Committee of the Conduit-street Exhibition were not so fortunate as the Royal Academy in commanding sufficient interest to obtain a disqualification at Brompton for all drawings not previously exhibited, thus preserving the works of the current year for their own galleries. The consequence is, that although architects have been months busy preparing drawings of their best works, our foreign visitors will seek in vain for them at the Exhibition which is opened expressly and exclusively for them. We cannot complain of this result; it would have been foolish to expect otherwise; but we had every hope that the members of the Committee would at least have individually exerted themselves to supply the deficiency which they could not but anticipate. Instead of which these gentlemen are foremost amongst the absentees. Half of them have not been able to afford even a solitary contribution; three out of the nine who do contribute send but one drawing or photograph, and one of the remaining six shows us what at first sight appears but smoked glass, but what the catalogue kindly informs us are photographic views of Halifax Chapel. Mr. Edmeston, the Honorary Secretary, shows his accustomed zeal on behalf of the Society, which is so much indebted to him for his exertions. The designs are no great attraction to the walls, but they at least answer a good purpose this year in hiding vacant space. Mr. Truefitt, for once, is seen on so small a scale as to be with difficulty recognised. The only member of the Committee who comes out in his old form is Mr. Lamb; he contributes no less than nine frames, containing altogether between thirty and forty subjects. They are not all new; they belong to the past, present, and future. One, a sketch for a "Public Library," is, if we mistake not, that which was submitted in competition for the Liverpool Library some seven or eight years ago. They all bear more or less the stamp of Mr. Lamb's original and fertile mind; whether it be a simple cottage, warehouses for the Consignment and Store Company, or a large public building, he contrives to impose some characteristic feature into his work.

The architectural Royal Academicians, as usual, withhold their august patronage from the Architectural Exhibition, but as they so frequently—we may almost say constantly—show the same modesty in Trafalgar-square, we have not much to complain of. As it has, however, all along been more than likely that the best men of former years would this season be absent, we thought it not improbable that the honoured members of the profession would have seized the opportunity of displaying that ability for which they have been so justly rewarded. The International Exhibition would not confer a higher dignity than that which they possess. They would certainly have created interest in Conduit-street. Where, again, are the living English professors of the Queen's gold medal for architecture? Not certainly where they ought to be, supporting an architectural institution which needs the support of the best men in the profession in

order to make it worthy of it. We do not say that the lights which have so long been kept under a bushel have gone out, but we must be pardoned for saying that their brightness, so closely hidden, is of very little use. We walk through London; we look through the weekly list of tenders in our journal, and we find that architects have not been idle; we know they would be grieved if the Architectural Exhibition were to expire of atrophy, and yet they cannot seemingly give it that support which is essential to its existence, and which it deserves to possess. An architect who erects a large or a public building can afford to make a drawing of it for exhibition; an architect who submits a drawing in competition incurs no extra charge in lending it for a season; architects, again, who have made the profession a stepping-stone to a great reputation have, we believe, duties intimately associated with their honours—duties which should induce them to set before their professional brethren examples of the excellence which has secured to them so dignified and envied a position, thus to guide us in the path which we should tread.

The result, then, of the modesty of our great men, of the thoughtlessness or indifference of those of whom we more regret the temporary loss, and of the greater attraction at the International Exhibition, is that the walls at Conduit-street are very liberally sprinkled with drawings, which, but that they hide what would otherwise have had to be left blank, ought not to have been hung at all; and that, even with this unwelcome aid, the Great Gallery alone is filled. There is no use in suppressing this unpleasant fact, the very knowledge of it may be a stimulant to exertion next year.

Fortunately, on the present occasion, a grand collection of Pugin's sketches have been systematically arranged in the West Gallery, the walls of which, as well as two large screens, are completely covered with them. We shall speak of them more fully presently, but may now simply remark, that 900 unpublished drawings of the great pioneer of the Gothic revival, are sufficient to atone for even the absence of any work of that great architect, who, without mental exertion, has blown by steam a couple of huge bubbles at South Kensington, and enshrined himself conspicuously therein, like a fly in amber, leading all the world to wonder how he got there.

We can, on the present occasion, only notice the more prominent works hung upon the walls, and we must defer a detailed account even of them until we have an opportunity of bestowing sufficient attention to them.

We cannot help remarking upon the largely increased number of photographs which are this season exhibited, and that they are, moreover, in many cases taken from drawings instead of from the existing building. We may gather thence, perhaps, that the original drawings are gone to South Kensington. If every architect had given even such second consideration as this implies to the Architectural Exhibition, we should have had little ground for complaint at the paucity of the works.

Several of the old contributors are still seen to advantage, and they deserve the greater amount of thanks, because their works would have shone prominently forth from amidst any collections of architectural drawings. Messrs. Green and De Ville send no less than a dozen frames, mostly competition drawings. The Italian designs have generally been honoured with a premium of some kind, and they undoubtedly deserve it; but we cannot understand why these architects, who are so proficient in one style, will go out of their way to prepare such a coarse piece of Gothic work as the Unitarian chapel at Hampstead (29). Their several designs for town-halls, and for the Palais de Justice, at Brussels, are better than anything we have ever before seen from them. The interior of the concert room at the Hartley Institute is a lovely piece of decoration.

Mr. C. Foster Hayward is likewise this year a most valuable contributor, and shows a marked advance upon anything which he has previously exhibited. His shops at Haltham, Essex (9), are exquisitely designed, and his little Swiss chalet erected at Lexden-park, Colchester, is worthy of the three views given of it.

Mr. R. Phene Spiers, who, we believe, has only on one previous occasion exhibited here, sends the drawings for a villa, which procured him a premium from the Institute. They show a vast amount of study, and the careful training of the school in which he has evidently been educated. Every form is chaste and elegant; the ornament is tenderly applied, and blends happily with the moulded stone, giving it richness without coarseness, and varying the treatment without in the slightest degree disturbing the unity of the composition. The interior is treated in the same artistic manner. The same gentleman exhibits three sketches in one frame; that of "The Château of Chenonceaux" in the centre does not please us much, but the two spires of Chartres Cathedral are brilliantly represented.

We have several examples of the fine foreign Gothic work of Mr. E. W. Godwin—that shown in the Town-hall at Northampton, of which we, some two months ago, gave a view, is especially good. That for the Swansea Public Hall and Market is injured by the piers, which seem to compress the upper windows. Another architect, Mr. R. W. Edis, has with equal success taken up with this foreign Gothic. His design for the New Town Hall at Hull is a favourable specimen of his manner of dealing with it. The same architect has designed a chimney-piece for the Poet Laureate, and another for Mr. T. Woolner (64). Mr. J. P. Jones is as prolific as usual, and Mr. C. H. Smith has an amusing design for an octagon vestibule (86). Mr. Pope gives us a photograph of Archbishop Holgate's Hospital, Yorkshire, of which we had the original etching here two years ago.

The architect of the successful design for "The Godolphin School, Hammersmith," has at length exhibited it. We have already seen the unsuccessful designs. They had external architectural attractions of a high order. This, we presume, has obtained its success by some excellent

internal decoration, which the common-place brick walls unfortunately hide. The merit of such qualities must have been very great to carry the elevation through even a competition committee. The fact of its doing so is evidence of the excellence, which no one has an opportunity of pirating, because it is only implied, and is not unfolded to us. We must congratulate the architect on his good taste in sacrificing in execution the ugly, although original, tower, which, in the drawing, surmounts the building.

One of the best drawings in the room is the interior view of Mr. W. Wilkinson's "Design for the Agricultural Hall at Islington," and the largest is a cartoon by Mr. Gibbs. They both have attractions, but of a very different kind. The very elaborate sketches which Mr. Vaughan has heretofore produced are this year gleaned from Germany, Italy, and Sicily; but we infinitely prefer the less laboured and more spirited sketches of Mr. Benzeley (81).

The collection of building materials shows evidence of the same antagonistic influence as does that of the drawings. Messrs. Hart and Son do not exhibit at all, and Messrs. Minton are also absent. The post of honour in the Cross Gallery is occupied by a large model of Sedley's Patent Iron Bridge, which combines the uses and advantages of the Tubular, Girder, and Suspension principles. Messrs. Cox and Son have furnished their recess in their customary manner with excellent examples of wood carving, but we must defer to another opportunity descriptions of it, as well as of other works, which we are this week unable even to mention.

THE "DICTIONARY OF ARCHITECTURE."

MR. ARTHUR CATES, the hon. secretary to the Architectural Publication Society, writes, with reference to the notice of the Society's Dictionary in our last Number:—

"This Society is much indebted to you for the manner in which you last week placed before the profession its objects and position, and with reference to one portion of your remarks I would beg leave to state that the best manner of increasing the number of subscribers, and, at the same time, of reducing to new comers the weight of the subscriptions accrued for past years, has long been an object of solicitude to the Committee; and the course adopted—to permit each new subscriber, who may so desire, to spread the payment of the back years' subscriptions over any reasonable period he may wish—has received general approval, and is working very satisfactorily; a considerable number of new subscribers having been recently enrolled under these conditions.

"The success of a Society of this nature must, in a great degree, depend on the active co-operation of its members in making its existence and works well known within their own circles; and, from the results which have recently followed the exertions of one or two of our members, I am confident that very much advantage would result if all could be induced to follow in such a course—not limiting their suggestions to their professional friends, but bringing "the Dictionary" under the notice of that very numerous and influential class, in whose libraries such a work would be of the greatest value; and I shall always be happy to consider any suggestion on the subject, and to communicate to all inquirers every information respecting the Society.

"One leading object of the Committee has been so to conduct the publications as to secure the maintenance of the market value of the work, and to guard against any such depreciation in price as now too often occurs to the prejudice of original subscribers. In this I have every reason to believe that they have entirely succeeded; and as they now stand pledged not to sell any portion of the work at less than the subscription price, and as the stock of past years' works is limited, it appears to me very desirable that the profession should clearly understand that there is not the least probability that by waiting they may be able to purchase the work at any reduction on the original price. And, further, that all who desire to possess it should not longer delay placing their names on the list of members in order that they may secure a copy."

DARTMOUTH IMPROVEMENT COMPETITION.

WE learn that the Dartmouth Town Council have, in relation to the plans for the improvement of their town, awarded the first premium to Mr. John Bell, engineer of the Dartmouth and Torbay Railway; and the second to Messrs. Rickes and Isaac, architects, of Northgate-street, Bath.

PAINSWICK, GLOUCESTERSHIRE, CEMETERY COMPETITION.

WE understand that, designs having been submitted in competition for the proposed new cemetery, those by Messrs. Elmslie, Francy, and Haddon, architects, of Malvern, London, and Hereford, were selected as being the most suitable.

The chapels, with porch and robing-room to each, are in the Decorated style, and are to be built of local stone; the roofs are to be covered with Staffordshire tiles. Between the chapels is a tower and spire.

The lodge, entrance gates, boundary walls, and palisading are to be of appropriate character.

The grounds are about 4 acres in extent, 2½ acres of which are allotted to the consecrated portion, and 1½ to the unconsecrated portion.

Tenders for the whole of the works have been received, and that submitted by Mr. Henry Birchall, of Birmingham, is accepted. The works are to be commenced immediately.

EXHIBITION OF THE SOCIETY OF BRITISH ARTISTS.

THE present exhibition differs little from some of the more recent of its 33 annual predecessors, still existing in our memory. The landscapes are as numerous, and few of them better than formerly. The figure subjects are, generally speaking, less ambitious than we have seen on some late occasions, and the cattle painters have not thrown into shade the merits of their more early labours. The largest picture in the exhibition is by Mr. Salter, and represents "King Charles II. Presenting to his Queen, Catherine of Braganza, a List of the Ladies he proposes to Wait on Her Majesty." Such a picture is entirely above the powers of this artist, and we confess to being deficient in both patience and forbearance to criticise such pretensions with decorum, and shall, therefore, remain silent. "The Relief of Lucknow by Generals Havelock and Outram," by Mr. G. Foggo, is a picture of some interest, which we have seen somewhere before; but we think now, as we thought then, that art is too ostentatiously displayed in the construction of the central group, and deprives the incidents of that probability and naturalness which would give them reality and interest. We do not object to see the rules of art employed, but how much of them may be made apparent to the casual observer must depend entirely on the nature of the subject. The defence of Lucknow was, beyond all doubt, heroic in the extreme, but the meeting after that noble defence was naturally a manifestation of strong but ordinary human feeling; any show of affectation in any of the actors at that moment would have been most offensive, and art-affectation in representing the event is equally out of place. It is such displays of rules that enables pre-Raffaellites to employ the word "composition" in derision of the sound principles of art.

The gems of the present exhibition are few. In the figure department, "The Return of the Lost Sailor" will become the picture of the year in these rooms. It is remarkable for the extremely energetic attitude of the wife, which is both skilfully and legitimately accounted for by a widow's cap thrown on the ground. The only objection to it is, that it implies a little more presence of mind on her part than is consistent with her astonishment and frantic joy. The artist would probably have acted more wisely had he placed the cap nearer to her, as if it had fallen from her head, when she, instead of rushing into her husband's arms, threw herself down on her knees, clasped her hands, looking up to heaven, her eyes filled with tears, returning thanks for his being alive more than for pleasure at his return. At present this piece of millinery forms too obtrusive a feature by being placed so prominently in the foreground. The spectator should have had to find it more than having it thus forced upon his attention. That kind of hidden information is always advisable, because the discoverer becomes so far identified with the artist, and takes, consequently, more interest in the picture. The husband's manner is, very properly, mild, soothing, and affectionate, because he is not influenced so powerfully as his wife, for, as she believed him dead, his arrival is greatly more surprising to her than she being where he expected to find her is to him. We are not quite certain that the presence of the child increases the pathos of the scene. If this subject were not so forcibly represented as it is, the elaborate style of execution would spoil it. All the accessories are so highly finished as to attract attention on their own account, and we regret to see that an artist capable of depicting human passion so powerfully, should, perhaps in obedience to the fashion of the day, render himself liable to the charge of "namby-pambyism." His sailor is far from being the travel-worn and picturesque figure described by the lines quoted in the catalogue. The painter of this otherwise excellent subject is Mr. T. Roberts, whom we are, unfortunately, obliged to censure as well as praise, but the latter relates to his success in the highest branch of art, and the former refers to the secondary consideration in a picture.

The landscape, which, according to our present impression, deserves especial notice, is a view at "Stanlake Bridge," by Mr. W. W. Gosling. It has the rare merit of illustrating the quotation that follows its title in the catalogue, for it is a peaceful vale seen beneath the summer's sun, whose beams are playing fitfully between the stems and the branches of the trees overhanging the gurgling brook in the middle distance, and the *débris* in the foreground shows that the stream becomes a roaring flood in the winter, carrying all before it. The whole of the middle and extreme distance is treated with complete unity of effect. There is a pleasing light and leafy character in the management of the trees. The water is agreeably placid and transparent. The lights, without appearing artificial, are so arranged as to carry the eye easily through the subject. There is no doubt that the spottiness on the foreground tends greatly to the pleasing sense of repose pervading the rest of the picture, but we think it, by excess, shows the painter to have been over anxious on the point, and we would suggest monotone is better suited to large masses, and should be neutral in tint; but the numerous small pieces of stone in the foreground are too positive, both in colour and form, to do all the good the artist intended when he introduced them. However, we think, taking this picture as a whole, it has the advantage over its neighbour, by Mr. Vicat Cole, of a similar subject, being entitled "The Brook." This latter is certainly a very pleasing distance of well lit landscape seen between the opening of the trees, but his foreground is still more censurable, being more hard, bald, and uninteresting than that in Mr. Gosling's picture. We regret that Mr. Vicat Cole should have quitted his open corn-land scenery, in which he was so successful.

On the contrary, we have to congratulate Mr. G. Syer on the change we find in his treatment of a coast scene "near Conway." Not because it displays more knowledge of art or greater ability as regards execution than formerly, but because it is altogether a more generally pleasing effect

of light and atmosphere than this artist usually exhibits, and is, therefore, more likely to obtain for his talents that admiration from the public which they have always deserved. We have selected this picture as one of the gems of the exhibition, not only for what we have just stated, but because, when compared with the rest, it presents, besides its pleasing tone and charming atmosphere, a sense of unity and completeness more than usually satisfactory.

The "Way-side Gossip—Scene in Surrey," by Mr. F. W. Hulme, is another picture we select, on account of the painter having entirely succeeded in accomplishing his intention, and think equally so in communicating it to others. The subject is a simple one, but a brilliant effect of mid-day sun was the charm which, no doubt, induced the painting of the scene, and the result is perfect success. There is a kind of hard metallic effect produced by the strongly enforced objects in the foreground of this picture, which is rather repulsive at first sight, and we think more than enough so, to produce a contrast to the delicacy of the distance; but it belongs to the realistic school of art, and there seems to be few artists who appear to have the moral courage to neglect it in some part of a picture.

We must place also among the gems of the exhibition a picture by Mr. J. T. Peel, entitled "The Picture," because elaborate making out of parts, strong colouring, and obtrusive lights are so much in fashion, that it is quite delightful to meet with a painting modestly subdued in all those respects, and in which the faces are not painted "flesh colour" to the very roots of the air, like masks, and with the features as immovable. The faces of the two young girls in question have all the ease of nature, and their features have apparently all the flexibility required. They are, therefore, playfully smiling without fixed grimace—a happy effect obtained by the absence of all unnecessary drawing in hard lines of the separate forms. There is great breadth of middle tint relieved by lights, both soft and partial; the colouring is so subdued as not to catch the eye, and the entire attention of the spectator is consequently allowed to rest on the most interesting part of the subject—namely, the smiling countenances of the two young girls looking at a print which evidently affords them much amusement.

From among Mr. A. Woolmer's numerous contributions, we select "The Maiden's Dream" as a very poetical effect of moonlight playing on the elegant form of a sleeping female. How the quotation from Shakspeare applies—"Oh, then, I see Queen Mab hath been with you"—we failed to discover. The inserting of quotations in catalogues seems to be very generally adopted by artists for the sake of giving space and importance to their own names. However, the picture may be admired for its well-managed tone and complete effect. We think "The Fortune Teller," by Mr. Cobbett, in the same room, will also be admired for the indolent attitude of the girl telling her own fortune, and the doubtful expression in her face. "Beat my Neighbour" is more appropriately high in finish than, as far as we recollect, any other picture in the exhibition. The subject is unimportant and the picture is small, and, therefore, as it must be looked at closely, admits of a smooth style of manipulation, the prevalence of subdued and cool monotone, relieved by variety of tint, without disturbing the breadth of the general effect, is equally appropriate and skilfully managed. Better than all, while the finish enhances the value of the picture by the taste and care with which it is executed, it does not in the slightest degree interfere with the expression in the faces or the fun of the subject. The boy has evidently the winning card, and laughs at the puzzled look of his elder companion as to which of his last two cards he will play, and the subject becomes still more laughable from the fact that his thoughts and anxiety are clearly useless.

Without pretending that "Cinderella flying from the Ball, changing as she runs," is a successful effort, and deserving especial notice on that account, we think there is too much merit in attempting a subject so difficult, and industry displayed in its execution, to be passed over in silence. She has stayed until the last moment allowed by the fairy, and her rich jewels are falling off, and her fine costume is changing to her ordinary dress, as she quits the ball-room. As it is, the picture looks, as far as the principal figure is concerned, unfinished. To make the subject intelligible as far as possible, the fairy, her coach, and sprites, or something illustrative, supposed to be invisible to all but Cinderella herself, should be introduced. This is the only means the artist has, under such circumstances, of showing what is passing in the mind and influencing the action of an important person in his composition. If an authority be required for such a mode of treatment, we will quote a highly classical one—Poussin—who, when he represented Coriolanus in the Volscian camp, with his family and a whole train of Roman matrons kneeling in supplication, in order to show the ideas passing in the mind of the hero, introduced a female warrior, as the tutelary genius of Rome, and her attendant Fortune, to terrify him into compliance, warning him to yield to the destiny of his country. Unless the painter has the genius to invent such an illustration of his subject, and the moral courage to provoke adverse criticism—a bold innovation in these eminently practical and coldly matter-of-fact days—such a subject as "Cinderella flying from the Ball," changing as she quits it, should not be painted.

A young aspirant for fame, in the person of Miss Edwards, sends a pretty little picture of "Rosalind and Cecilia"—"As You Like it." The moment chosen we suppose to be when Rosalind exclaims "Oh! how weary my spirits are," or to that effect. There are pleasing character and very delicate painting in this small work, but we think it scarcely possible to make it clear for whom the figures are intended without "Touchstone," as the time is past when an artist could have got over the difficulty by writing on one of the trees "this is the forest of Arden."

"Gaming and its Results," by Mr. H. J. Pidding, is another picture deserving of notice, for the labour and talent which have been bestowed upon it, although the subject is far from new and the result not eminently successful. We observe that the artist has decorated the *salon* of gamblers with casts from the well-known antique figures; and as he has indicated an acquaintance with classic art, and shows that his early practice has been in that excellent school, we may entertain a hope that the evident want of happy facility in drawing figures in modern dress arises merely from limited experience in that respect, and, therefore, relying upon the admirable foundation, he has, we presume, laid in his early studies, that nothing but perseverance is required to render him a valuable contributor to our annual exhibitions. We fear, however, on reflection, that this artist's name has unfortunately been before the public too many years to justify the hope we have just expressed. The principal incidents are not new, as well as the general subject, but the artist has bestowed much thought on the necessary variety of character in the persons assembled.

"The Dog in the Manger," by Mr. G. Cole, shows how much in almost every respect an artist is deficient when he attempts an animal of the size of real life. The cow's head in this picture wants the exact reality of texture, anatomy, and drawing in their highest degree of truth and refinement to make such a picture desirable. The dog is, however, spirited and clever. Mr. Pyne exhibits his usual number of landscapes or sea pieces, which possess, with one exception, his well-known conventional tone of atmosphere, delicacy of treatment, and elegant execution. But the one to which we decidedly object is that we believe entitled "Naples from the Bay," in which he has represented the foam on the waves like so many strips of white tape, with what intention it is impossible to guess, unless he was pandering to the taste of some possible art-union prize-holder infected with pre-Raphaelite inclination.

The comic subjects are few. The most laughable is, probably, "The Duet, Music hath Charms," a laughing boy scraping a violin till he breaks the strings, making a dog howl most piteously. It is very well painted by Mr. G. A. Holmes. The features of the boy's face, however, are made out in the hard manner to which we have already objected. That face, looked at abstractedly, could never change from what it is. There is some humour in "The Five Senses," illustrated by boys, girls, and children, in the most homely manner. The same artist, Mr. Bromly, has the interior of a boys' school very amusingly treated. It is entitled "Oughts and Crosses." The principal players at that game appear likely to verify the old saying of lovers, that "Two are company, but three are none," for the school-master, cane in hand, is cautiously approaching to take his part in the proceedings, on which the players are represented as being very intently occupied. This is a well coloured picture, the heads have character, and are also equally well varied in position. There is "A Welsh School," by Mr. Cobbett, which, without being intended for a comic scene, is well painted, and the effect of clear daylight extremely well rendered. A "Stitch in Time," by Mr. J. Hayler, is one of those pictures of which the origin is difficult to guess. In this instance, one is puzzled to decide whether the artist was desirous of showing how he could paint a naked boy, and make the old and excellent saying an excuse for doing so; but if the saying itself suggested the picture, the illustration is most absurd, because there is something incongruous in a boy quite naked sitting on a table while his clothes are being mended, for surely the neglect of a stitch in time can hardly apply to his under garment, even if we admit that it may have had a serious effect on his jacket and trousers. However, there is a great deal of slovenly character about the father, and certainly the evident difficulty he has to thread the needle may be some excuse for having delayed the operation so long. The style of painting is remarkably broad and effective. The sculpture is better than usual.

The visitor to this exhibition must not fancy because there is no "lion" that there is no picture worth looking at, for, on the contrary, the more the collection is examined the more there will be found worthy of notice.

UTILISATION OF THE SEWAGE OF TOWNS.

THE Select Committee of the House of Commons appointed to inquire into the best means of utilising the sewage of cities and towns of England, with a view to the reduction of local taxation and the benefit of agriculture, have met for the first time.

The Earl of Essex was examined, and he stated that he had 200 acres of land at Watford that he irrigated by sewage. He had applied it experimentally to wheat, roots, and common grass, but more especially to rye grass, which gave him an increase in value of £2 per acre clear profit. He irrigated two acres of wheat with from 60,000 to 80,000 gallons of sewage. Eighty thousand tons a year cost 1d. to 1½d. a ton, but it might in many cases be effected for ½d. He had found it most efficacious in destroying weedy substances, and it had increased the production of corn to a most incredible degree. He had extensively applied the sewage to land, and in five minutes afterwards there was not the slightest smell therefrom. He had employed the same men to apply the sewage for years, and never knew them to suffer in health in the slightest degree. He was Chairman of the Royal Commission of 1857, appointed to inquire into the disposal of the sewage of towns, and that commission drew up a report in which regret was expressed that so little progress had been made in the disposal of the sewage of towns. Sixty thousand tons of sewage per year would be sufficient for fifty acres of land, and that could be obtained from a town consisting of 4,000 inhabitants. Sewage was a permanent benefit to the land. He used the sewage on land within 100 yards from his own house and found no annoyance from it, and, indeed, in five minutes after the irrigation there was no smell from it.

After another witness had been examined, the Committee adjourned.

PIER WORKS ON THE DANUBE.

IN giving a description of the Delta of the Danube, and of the works recently executed at the Sulina mouth, before the Institution of Civil Engineers, the author, Mr. C. A. HARTLEY, said that the European Commission of the Danube having resolved to improve the bar channel of the Sulina, by guiding piers of a temporary character, in order to give the speediest relief to the navigation in the cheapest manner, he, as Chief Engineer, received instructions to provide works which, for the expenditure of a sum limited to £80,000, should have the effect of giving an increased depth of at least 2 feet, over a period of from six to eight years.

The designs for the provisional works were then matured; and as it was found, in practice, that the cost of strong timber cribs, to be loaded with stone, and sunk at intervals of 20 feet along the line of the works, would exceed the original estimate, choice was finally made of a structure composed of timber piling and *pierre perdue*, surmounted by a timber platform 14 feet wide, strengthened occasionally by solidly constructed cribs of the same width. The works were commenced on the 21st April, 1858, a temporary staging, fixed on piles, being always run out from 200 to 300 feet in advance of the permanent piling. This staging supported nine crab engines, by which three rows of three piles, each 13 inches square, and 7 feet apart, were frequently driven, in one day, to a depth of 16 feet into the hard fine sand of which the bottom was composed. The piles were then immediately secured by double longitudinal walings and double cross-ties, the whole being surmounted by two thick trampedies and planking, at 4 feet above the level of the sea. From this permanent platform the close piling on the side next to the sea was driven. The daily rate of progress, during fine weather, was 20 lineal feet; and as soon as this length of sheet piles was completed, stones were thrown down to protect the footing in the sand, which was liable to be washed away by the action of the sea. This scouring action of the sea was so serious, when the skirt of the bar was reached, that it threatened at one time to demand, for the completion of the works, double the quantity of stone originally estimated. Several plans were tried to reduce its pernicious effects. That eventually adopted, and which was perfectly successful, was to advance the open pile work with all possible expedition, and then to pave the proposed seat of the pier with stones, delivered from barges. This pavement withstood the attacks of the sea, and offered no great obstruction to the penetration of the sheet piles, which, without being shod, had frequently been driven 10 feet into the ground, after having been forced through 8 feet of rubble stone. The section of the finished stonework was a solid mass of closely packed third-class rubble, resting on a broad base, and narrowing upwards at slopes varying from 2 to 1, near the pier heads, to 1 to 1 and 1½ to 1 near the shore, until slightly below the level of the water, it became a mere ridge against the close piling. The time occupied in the actual construction of the piers was thirty-one months, exclusive of three winter months each year, during which the Danube was frozen over, and all work was suspended, but inclusive of two hundred and seven days when it was impossible to work on account of stormy weather. The length of the north pier was 4,631 feet, that of the south pier was 3,000 feet, and the depth of water in which they were built varied from 6 to 20 feet. In their construction 200,000 tons of stone and 12,500 piles had been employed, and the cost had not exceeded ten guineas per lineal foot. The stone was brought from a distance of 60 miles, and its price, delivered in place, varied from 4s. to 5s. per ton; the oak used for the longitudinal and transverse timbers and for the planking and fender piles cost 2s. 3d. per cubic foot, while the fir timber piles were delivered ready for driving for 4d. per cubic foot. The workmen, of whom there were generally 300, were composed of men belonging to more than ten different nations. Labourers were paid 2s. 6d., and carpenters 4s. 6d. per day.

THE ALBERT MEMORIAL.

THE Committee held a meeting last Friday, and it appears that as yet no stone has appeared to them more suitable for the purpose in all respects than that which lies in a granite quarry of the Duke of Argyll, in the Island of Mull, to which reference has been made, though they have arrived at no decision on the subject. They were informed that since their last meeting workmen have been busily engaged in uncovering more of the stone at Mull than had been previously revealed; that they have now dug round one of the extremities, and that though the other one is still uncovered, this block of granite is now cleared to the length of 115 feet, or eight or ten feet longer than it was supposed to be. The committee were further informed that all practical men on the spot concurred in the belief that the stone is sound and perfect, but that no absolute opinion could be pronounced until it shall have been wholly detached and carefully sounded all round and throughout its entire length, which will be a work of time. A rough specimen broken from the block itself has been received in London, and is about to be polished.

A letter has been received from the proprietor of a granite quarry at Balmoral, stating that it contains a single stone about 100 feet in length and nearly 50 feet broad. The letter was accompanied by a polished specimen, but the colour is not so satisfactory as that of the Mull granite, while the cost of conveying it to the coast would be greater than that of removing the block at Mull, which is distant about 500 yards from the sea.

THE MAUSOLEUM FOR PRINCE ALBERT.—On Saturday week her Majesty the Queen laid the first stone of a mausoleum in Frogmore gardens, in which are to be deposited the remains of the Prince Consort, and, ultimately, her own. Upon the stone is the following inscription:—"The foundation-stone of this building, erected by Queen Victoria in pious remembrance of her great and good husband, was laid by her the 15th day of March, A.D. 1862. Blessed are they that sleep in the Lord." The building is to be erected under the superintendence of A. J. Humbert, Esq., architect. The reclining statue of the Prince will be executed by Baron Marochetti.

GIGANTIC ENGINEERING PROJECT.—Under the above head, the *Mechanics' Magazine* remarks at some length on a scheme of M. Alphonse Oudry, *Ingénieur du Corps Impérial des Ponts et Chaussées à Paris*, who has proposed to unite Calabria with the island of Sicily, by means of a suspension bridge over the Strait of Messina. The distance across the Strait is about two miles and eight-tenths, requiring for each line of the suspension-chains one thousand six hundred feet in length, while the intervals proposed between each of the points of suspension are three thousand two hundred and eighty-one feet each; the width of road-bed is to be sixty-six feet.

THE INTERNATIONAL EXHIBITION BUILDING.

THE building for the International Exhibition, nominally finished a month ago, still occupies a vast army of busy workmen. The Commissioners, we are told, even despair of having it actually finished in due time. One of the main causes for the delay was the time wasted in determining the nature of the internal decoration, for, until that was decided, no step could be taken for removing the scaffolding which stood in the nave and filled the transepts. The flooring had all to be prepared, as well as laid, after such clearance had been effected. No blame can be attached to the contractors for this delay. They did all that men could do to prevent it. They spared neither expense nor energy in the performance of their work; but the experiments in colour were deemed essential, and, indeed, were so, to the amateurs who had sufficient influence to exhibit their individual weakness, and only at the last moment was a man in any way competent entrusted with the thankless task. We say thankless advisedly, because Mr. Crace really has not had a fair opportunity to show his powers. The structure he had to work upon was unworthy of the material he had to work with. He was expected to hide with ornament the want of art. It is no disparagement to Mr. Crace to say that he has failed. Here and there we have glimpses of right principles, but they are not consistently carried out. The framework of the nave and transept ribs seems all awry by its alternate colours. They come far more forward when looked at from a distance than their more soberly tinted corresponding pillars. The chequers on the soffits of these ribs give a false appearance to them, and, moreover, a weak one. Looked at from below, the dark portions seem apertures, which is irreconcilable with the decoration of their face. Sufficient attention has not been paid throughout the building to a clear and unmistakable definition of the forms of the timbers. The face and soffits are often coloured the same tint to the obliteration of thearris-line. Red and blue are used indiscriminately to relieve ornament. We look obliquely through the large courts; the slight and subdued tints gradually die into a pleasant pearly neutral, but the blotches of red colour in the ugly capitals of the square columns thrust themselves obtrusively forward as though demanding "What think ye of us?" We think them simply offensive; they mar the retiring character which this portion of the building possesses, and which, but for them, would be the least conspicuous, and, therefore, for an Exhibition building, the most satisfactory part of Mr. Crace's work. We must not, however, do injustice to the picture gallery, which, taken by itself, is most successfully painted. Presuming that Captain Fowke's principal rafters are to be hidden by a horizontal light, we may even say that the decorator has modified a considerable amount of its repulsiveness. There is no particular novelty in the colouring, and no great quantity of ornament, but what is done is done with taste and judgment. The walls are of a warm green tint, the soffits of the moulded strings and cornices are of a dead red colour, and the same tint—a kind of maroon—defines the panels in the cove. A broad band of the same colour, with festoons and medallions at the sides, frames the doorways. We can conceive no better arrangement, considering the time for preparation and execution, than that here carried out.

The backing of the tasteless open iron gallery-railing is seemingly to consist of dull red cloth. The last time we saw this railing a portion of it was experimentally painted a bright blue. We were glad to see that abortion strangled at its birth; but the sap green tint, with the little patches of gilding and ebeccolate ground which replaced it, really deserved no better fate.

We notice with regret that the French, to acquire more wall space, are enclosing the whole of their large court at the south-west corner of the building; if this plan be repeated in the other courts, the only general and extended views of the interior will be those of the nave and transepts, and no visitor will be able to embrace at a glance a title of the building's extent. We would, however, direct attention to the happy way in which our neighbours from across channel are planning their court. By using freely diagonal passages a much larger surface of show-space is most ingeniously obtained.

The domes, which were to have "dwarfed Diana's marvel to a cell," are still very troublesome. Uneasy is the head that wears a crown, and still more so must the building be which has two, and two such over-balancing incumbrances as those at South Kensington. The scaffolding is not yet out of them, and yet after the brisk gales which lately swept over London, they looked as though they had been peppered with grape shot. How repairs to them will hereafter, when the scaffolding is removed, be effected, is a marvel to us. The domes are certainly useless, and it is equally certain that they are not ornamental. Would it not be well at once to put an inner roof to them at their springings, with all necessary rain-water down pipes, and thus, spite of the broken glass, prevent them becoming a continuous nuisance?

CEMENT DRAINS FOR LAND.—A very simple but ingenious mole-plough, for cutting drains for agricultural purposes, and covering over the tunnel thus formed with cement, has been made by Mr. Watson, of Ohio, U.S. The great obstacle to draining land on an extensive scale is the expense of digging with the spade by hand labour, and the cost of the tile tubing used for the watercourses. In this ingenious invention the ploughshare, connected to the beam by a thin sword-standard, protrudes below the carriage to the required depth of the drain in the subsoil, and in its forward passage scoops out the drain-hole. A spiral conical trowel follows, spreading all round the hole thus made the hydraulic cement, which runs down from a hopper above between the ploughshare and the trowel, and thus, completely plastering it with cement, forms a continuous tubing for the drainage water.—*London Review.*

A COMPARISON OF SOME OF THE DETAILS OF BUILDING ADOPTED IN ENGLAND, AND IN OTHER COUNTRIES.*

THE liberality with which the leading men in France communicate their works to the technical and scientific journals for publication, and the numerous Government establishments for teaching arts and sciences where those publications are accessible to any one who likes to apply, tend to popularise science, and to keep the inquiring members of the higher trades "well up" to the progress of the age. In these matters we do not manage quite so well as they do in France; and we do not possess such extensively organised means of public instruction of a high order; but perhaps our working classes are, on that very account, the better fitted to take care of themselves, and learn that greatest and best habit of self-reliance, so strikingly deficient among foreign workmen. Be this as it may, the modern carpentry works of France are as neatly finished and as well put together as anything we see here; their scantlings are, perhaps, even more logically chosen, and indeed the objection that they display rather an affectation of mathematical correctness may often be urged against them. I would quote, as an illustration of some of the best pieces of recently executed French carpentry, the highly decorated spire of la Sainte Chapelle, the marvellously solid scaffolding of the Louvre; the suspended service bridge of the Pont Neuf; the centres of the Mont Louis bridge over the Loire, and the ingenious method of easing those centres; and the lock gates of the old Bassin de la Floride, at Javre. As to the Belgian and the Dutch carpenters, they are still about half a century behind our French neighbours, the Americans, and ourselves. The Germans and the Swiss, so far as I have been able to form an opinion, are rapidly treading on our heels; whilst the Spaniards, Portuguese, and Italians, are even behind the Dutchmen in the practice of the noble art of carpentry.

It is worthy of remark that in Holland, in some parts of Germany, in the centre of France, in Spain, in Northern Italy, and, in fact, wherever gypsum is not easily obtained, there is a tendency to dispense with the use of ceilings, and to leave the joists apparent, whether planed or unplanned. In all those districts, too, the joists are made out of square baulks, and the house carpenters do not seem to be aware of the law which renders the depth of a girder so important a function in its resistance. They use floor-boards also of great width and considerable thickness; but as they do not employ dogs, or other mechanical means for bringing the boards together, the shrinkage is necessarily very great, and the floors are disagreeably permeable to sound; in Spain and in Italy I will add permeable also to scents and visitors from the cattle stowed, not stalled, beneath. Carpentry, in fact, like all other arts, gains by the friction of the intellect of the nation applying it with the intellect of other nations; and it advances just in proportion as the habit of foreign intercourse may prevail. Local habits sometimes, however, have an independent influence upon the peculiar character of these arts, and it is curious to observe how the traditions of ship carpentry affect the habits of the Dutch house builders, and how the necessity for providing against the treacherous nature of the soil they build upon compels them to adopt scantlings different from those we could safely employ. Their joists as often have to resist the inward as the outward movements of the external walls, and must, therefore, present great lateral stiffness in order to allow of their acting as struts. If thus we inquire deeply into the things we may at first be disposed to sneer at amongst foreigners, so we shall generally find that there is some practical foundation for everything like national habits.

The reference I made just now to the influence which the art of shipbuilding has had upon the style of carpentry of Holland, brings me to a curious part of our subject, upon which, perhaps, we have something to learn. In Holland the shipbuilders' traditions have been so strong, that, throughout the length and breadth of the land, the staircases are built precisely upon the model of the companion ladders of ships. The pitch of the stairs is remarkably steep, the treads are let into strong wall-strings at each end, and the spaces between the treads are left open; there are no risers in fact. Generally speaking, in the houses of the middle and of the poorer classes, these ladder staircases are made between closed partitions, with ropes against the sides instead of hand-rails; open well-holes are unknown, and there is a sad deficiency of light and of ventilation. These defects prevail, in a minor degree, it is true, in Belgium and in French Flanders; but in France proper the art of staircase building, whether in wood or in stone, is carried on in a manner immeasurably superior to the one we adopt. Such an abomination as a "dog's leg" staircase would never be admitted in that country; and in no case would a French builder dream of executing winders terminating in a point. We here seem to think that if we present a sufficient width of tread in the middle of our flyers we have done all that we need do, and we leave the narrow ends of the treads to take care of themselves; a French staircase handrail, however, at erecting a staircase in which it should be possible to hold by the hand-rail in passing the turns, and so to arrange the edges of the treads, that the body of the person ascending or descending should, if I may use the phrase, retain the same swing from the top to the bottom of the stairs. Wherever they can do so the French builders arrange their staircases so as to have a long landing in a perfectly straight line, the inner edge of which forms the diameter of an elliptical curve, and the width of the treads is set out equally on the line drawn through the centre of their length, care being taken to make the minor axis in such proportion to the major axis, that in no part of the outer string should the width of the tread be insufficient to afford foothold. In a continuous flight, returning upon itself at right angles, with winders at the turn (where we, in fact, should put up a dog's-leg staircase), the French builder either sets out his steps upon a half ellipse divided upon the minor axis, or he applies such a half ellipse to the end of two parallel lines passing through the middle of the treads in such wise as to avoid the treads ending in a point. Of course, if he can secure an open well-hole, his winders are more convenient than when that advantage does not exist; but even in the latter case the French do not hesitate to sacrifice a little in the length of the treads in order to avoid their ending in a point. Uniformity and regularity of motion are with them the great desiderata of staircases; with us cheapness of construction is more sought after. I can speak practically, however, on this subject, for I worked for some years in an office in Paris, where I had four times a day to go up and down 90 steps, and for a similar period in an office in London, where I had to ascend 72 steps. The French steps were all winders! the English ones straight flyers, yet the fatigue in mounting the former was less than that felt upon the latter. It may be added that the French staircases are also generally easier than our own, on account of the better proportions observed between the rise and the tread of the steps; and as I do not find that any rule upon this subject is received amongst our workmen, I beg to mention the one which is adopted in France, namely, that inasmuch as on the average human beings move horizontally two feet in a stride, and as the labour of rising vertically is twice that of moving horizontally, the width of the tread added to twice the height of the rise should be equal to two feet.

I do not dwell upon the modes of setting out handrails, of working outer strings or soffits, because these details follow upon the principles adopted in setting out the stairs on the centre line of the treads. It would, however, well repay you to study the best examples of these works in Paris; and if you desired to study the modes of dealing with more monumental staircases, you would do well to refer to those of Central Italy. The manner in which the French have applied hollow pots to the formation of fireproof staircases is well described in Eck's work, and it would well repay your attention.

French joiners do not seem to me to be equal in skill to our own countrymen following that craft, and the joiners of the other countries I have visited are still more inferior. It would, indeed, be difficult for men working with the frightful looking saws, planes, and chisels the Frenchmen use to do good work; and the only wonder is, that they do what they actually do. We might, however, take good lessons from them in the preparation of opening sashes (French casements) and of sun blinds; their counter work, dadoing, sliding doors, and wall linings, are often framed with great skill; and their floors and parqueture are very beautiful. But they have a vile way of pegging the tenon joints of their framing, instead of gluing and wedging it up, which is very much to be avoided; and they are not particularly attentive to insuring the mathematical trueness of the faces of their panelling. In the cheaper style of house building the French joiners are fond of executing the doors in clamped and framed finish work, the frame and clamps being of oak, and the filling-in boards of poplar or of deal, and upon the faces large panels are formed by simply nailing

* Read before the Society of Builders' Foremen and Clerks of Works, Lyon's-inn Hall, on Wednesday, 12th March, by Mr. GEORGE R. BURNELL, civil engineer and architect. Continued from page 196.

on mouldings. These doors almost of necessity warp or split in consequence of the unequal contractions of the different woods; and they are by no means to be compared to our own four-panel doors, either for strength or for lightness. In the execution of door fittings our neighbours tolerate a degree of carelessness of execution which our architects would not allow; and, indeed, I suspect that there is something in the excitable impatient nature of the French workman which renders him incapable of the continued, sustained attention requisite to insure the perfection of this most difficult trade of joinery. It may be that the introduction of a better description of tools may enable our neighbours to turn out their work with greater perfection than they do now; but certainly I do not at present think that we have much to learn from the continental joiners; nay, rather on the contrary, that they could learn much from us in ordinary works at least. Of course I do not, in so saying, include wood carving in any of its branches; for in this walk of art we have very much to learn from both the French and the Belgians. The latter nation, indeed, retains much of the facility for handling wood which characterised its artists of the seventeenth and of the eighteenth centuries; the Germans and Swiss are also very skilful in this kind of work, but they are bad joiners. As for the Italians and Spaniards, the word has no meaning when applied to their workers of wood—their work hardly ever joins at all.

It is worthy of remark that, in most countries, the state of the blacksmith's and of the ironmonger's art may be taken as the criterion of its progress in material civilisation, because those details of building are usually considered beneath the architect's attention; and they are abandoned entirely to routine, unless in very exceptional cases. The extraordinary demand for iron roofs for railway sheds, and the great revolution produced in the whole of the arts of construction by the introduction of the railway system, have, however, caused engineers and architects to turn their attention of late years with more earnestness to the methods of employing both cast and wrought iron than was formerly the case; and in England, France, Belgium, and Germany, we, therefore, find that the methods of employing those materials have been greatly improved. At the present day I am far from being convinced that we retain any superiority over our neighbours in this respect; and were it not for such works as the Britannia and the Saltash bridges, the railway station roofs of Liverpool and Birmingham, I should be disposed to seek models for imitation in the smith's art in such works as the Cologne, Strasbourg, Theiss, &c., bridges, or in the roofs of the French and the Strasburg railway stations of Paris. In the use of cast iron, the French engineers have also been very successful of late, and the bridge of Tarn-con amont de Solferino, in Paris, may be referred to as proving their perfect mastery of the theory and practice of the application of that material to large structures. In more ornamental works, Englishmen are, I am ashamed to say, immeasurably behind the French, and even the Belgians, in the use of cast iron; and I would simply mention as proofs of this lamentable fact the lamp-posts of London and of Paris, or the miserable objects dignified by themselves as "fountains" or "statues," whether of cast iron or of bronze. No doubt these things enter within the domain of Art-education; but it is a source of humiliation to any rightly thinking Englishman to be compelled to acknowledge the utter incapacity of his countrymen now to contend in them with the nations we have been so long accustomed to lead. In machine-making, too, the French and Belgians are applying with wonderful skill and energy the lessons they learnt originally from us, whilst the patient untiring labour of the Germans is very rapidly placing them in the foremost ranks of the workers of metal, whether for useful or for ornamental purposes. If my voice could be heard by the misguided trades-unionsists of Sheffield, I would indeed raise it now and then, to warn them that the steel knife, tool, and file makers of Germany are now gaining on them so fast in the continental markets, that the prosperity of their (the Sheffield maker's) trade is already seriously threatened; and that a persistence in the attempt to regulate trade operations according to their own ideas will only result in establishing the fortunes of their continental rivals. We have no longer a monopoly of skill in engineering, in founding, in smith's work, or in engine making, and it is high time that our manufacturing classes should awaken to the fact that they have intelligent, steady, and earnest rivals in the field, men endowed with facilities for practical operations nearly, if not quite, equal to their own; and with æsthetic faculties infinitely superior. Nothing but a strong effort to improve our taste, and to perfect our technical processes can, indeed, enable us to retain our wonted place amongst the metal workers of the world—perhaps even our rank of metal producers may be threatened by the progress going on around us, for even Spain and Italy are entering upon the wide field of metallurgical enterprise, and the Rhenish provinces of Prussia are being boldly opened up for this purpose, hitherto, I know by personal experience, successfully.

The ironmongery of the continent is still, however, very far indeed from being equal in its construction, or in its style of finish, to that which we obtain in England, as a general rule. The locks made abroad are detestable, the bolts clumsy, the hinges flimsy; the escamoteur fastenings of French casements are, it is true, often elegant, and the gasfittings are often models of taste; but, on the whole, it does not seem that the English manufacturers have much to learn in these matters. I am not quite sure that in nail making we are quite right in the system we adopt; and, from some experiments I have witnessed, I am disposed to believe that the French nails (made out of drawn wire, pointed and headed by hand), hold more firmly than our nails (punched from flat plates) do. For ordinary purposes, however, our nails are quite good enough; and the manner of making them certainly reduces their price to a very low one—to a price which is, in fact, lower than that of the French nails, size for size. Screws are naturally made in the same manner all the world over; and as to spades, pickaxes, wrenches, screw-jacks, chains, crabs, pulleys, and the countless other articles of an ironmonger's shop, there is little for us to learn in other lands, excepting, perhaps, in America, where labour-saving tools are articles of such vital importance.

As to the plumber's, zinc worker's, coppersmith's, brazier's, slater's, tiler's, &c., arts, no especial remark need be made, for they are conducted almost everywhere in the same manner, with more or less of skill, and more or less of care. In the painter's art, the principal remark to be made on the foreign methods of carrying it into effect are, that there the oxide of zinc is more commonly, and more successfully used, instead of the oxide of lead, than has been the case here. I cannot quit this part of the subject, however, without calling your serious attention to the remarkable skill of the Dutch painters in producing what they call the porcelain painting, which consists of many coats of flat even tints, carefully rubbed down, and varnished. I have nowhere seen any painting to be compared, indeed, to the best descriptions of Dutch work.

Now, I beg distinctly to say that in these remarks I have been careful only to allude to the more obvious distinctions between the methods of building adopted in England and in the countries I have mentioned by name, and that, as I have practised my present professions of architect and civil engineer in all of those countries, I have been in the position to know the merits and demerits of the various schools. I have not hesitated, with your kind favour, to say boldly where I have thought that we are deficient, and as to the old saying "that to know our faults is half their cure," I believe that I am rendering the English workmen a real service by telling them of some of the defects of their present habits, and of the description of competition to which they may possibly be exposed. There is nothing so dangerous for a nation as to fancy that it is at the top of civilisation, and then draping itself in its mantle of self-sufficiency, going as it were to sleep in the enjoyment of its supposed advantages. We Englishmen, at the present day, are about to do this, and because we really are more skilful artisans and better organisers of the division of labour than other nations are, we are apt to forget that they are striving might and main to wrest the palm from us. In former times the Dutch occupied amongst industrial nations very much the same position, comparatively, that we do now, and they went to sleep in the imaginary security of their position. They waked now to find themselves not in the van of progress, but in its rear, and have earned for themselves the unenviable title of the "Chinese of Europe," notwithstanding their industry, their skill, their learning, and their intellectual capacity. May the lesson not be lost upon us; and may we, casting aside all false pride, receive gladly the lessons to be derived from whatsoever source, pondering over them thoughtfully and with the earnest desire for improvement. It is only on this condition that we can remain "a wise and understanding people," for candour to perceive and wisdom to adopt the good example set by others, are the first elements of the practical philosophy required in dealing with the affairs of daily life, even if they be not the first elements of national greatness.

In conclusion, I would observe that the French and Belgian Governments are about to send, at the national expense, picked men from the various trades of their countries to study the works about to be exposed in the Great Exhibition. If I might be allowed to

make some suggestions to you on this matter, they would be, firstly, to urge you to take some steps to welcome and to assist your fellow-workers during their visit; and, secondly, to organise some means of studying the Exhibition methodically for your own benefit. Could I serve you in either the one case or the other, I hope that you would command me, without scruple or hesitation. It is but little I can do to testify to your body the sense of good feeling and of obligation I feel towards you, for the way in which I have been always supported by those who have worked with, or, I may now say without boasting, under me; but that little shall be at all times given frankly, and, from the bottom of my heart I say it, gladly. As to our neighbours, I can say the same, I was always well and kindly treated by them, even in times when popular passions against foreigners were most rife; and you may trust me when I assure you that any hospitality you may show to our anticipated guests "will have its reward."

The organisation of benefit societies and of trade protection societies on the Continent, together with their "craft rules," must form the subject of a special communication, to which I hope to be able hereafter to invite your attention.

ON PICTORIAL MOSAIC AS AN ARCHITECTURAL EMBELLISHMENT.*

A FEW words will suffice to dismiss the sixth species of mosaic, which I have called "*Italian portable*." By this term, I would convey that the basis of the variety is not so much making portable mosaics, as, from the great weight of the materials, they can never be made easily portable, but rather making reproductions in mosaic of pictures in oil or other media, which may be really and readily transferable from place to place. This species is, in fact, little else than a revival of the fine *opus vermiculatum* of the ancients. It would be incorrect to say that the Greeks did not ever manufacture miniature mosaic pictures, because two noted specimens exist to my knowledge—one at Florence, and the other, of extraordinary perfection and curiosity, in the Kensington Museum; but it may be safely averred, from the great rarity of such relics, that the practice was altogether exceptional. This, indeed, is not to be wondered at, since, with the quick drying cement ordinarily used for mosaic work, it must have been extremely difficult to execute these almost microscopic pictures, which bring within the compass of a few square inches subjects usually worked out in as many square feet.

This leads us to the conclusion that the ancients for their finest mosaic pictures must have used some retarding agent, such as honey or beer would prove, to keep their cement plastic longer than it would remain if mixed with water only. When, however, Giovanni Battista Callandra applied, early in the seventeenth century, a mastic in lieu of an ordinary hydrate of lime, to unite the tessere, it became comparatively easy to copy the most elaborate pictures in mosaic. By this artist was executed the beautiful reproduction of Guido's St. Michael, which, with Raffaele's "Transfiguration and Domenichino's St. Jerome, is about the best of all the celebrated mosaic pictures in St. Peter's.

In the marble incrustation which forms our seventh species, and which is best known as *Florentine mosaic*, the tints and shades are given by the natural colours of the jasper, agates and other precious materials of which the work is composed. The hardest minerals only are used, and as each small piece must be cut and ground to a pattern, and each thin veneer backed by a thicker one of slate or some such material in order to give it strength, so much labour and time are involved in its production that its high price has necessarily limited its use. Zoli, the principal writer on the art of *pietra dura* mosaic, tells us that he knows of "no existing example in Italy of marble pictorial mosaic executed during the first periods of the revival of the arts, excepting the specimen to be seen in the central nave of Siena Cathedral, said to be the work of Duccio di Buoninsegna, who lived in the fourteenth century." There can be no doubt, however, that the art was founded on the "*opus sectile*" of the ancients, and that it descended by regular tradition from classical times. I need scarcely recall to your recollection the extraordinary advance made in the pavement of the same cathedral upon the work of Buoninsegna, by that great master of the sixteenth century, Beccafumi. The art was greatly patronised by the Medici. The celebrated "*Fabbrica Ducale*" of Florence was founded by Ferdinand I., Grand Duke of Tuscany, in 1588, and its reputation during the seventeenth century was kept up by the exertions of those artists to whom Florence owes the finest specimens of mosaic which enrich her palaces and galleries, and whose names are for the most part given to us by Baldinucci.

Before taking leave of this subject, we must not omit to notice the exquisite specimens produced in India of pictorial mosaics, representing the finest Arabesque and conventional ornament in *pietra dura*. That the Indians were early in possession of all the technical ability necessary for such work is proved by the antiquity of some of their gem-cuttings, inlaying, polishing, and carvings in hard stones; but it is probable that their sovereigns owed much to Italy for assistance in that beautiful marquetry which ornaments the great monuments at Delhi and Agra, for in 1688 a passport was obtained from the King of Spain, by the Grand Duke of Tuscany, for four workmen, skilled in mosaic working in precious stones, whom he was about to despatch to the Great Mogul.

This art is retained at the present day both in India and to even greater perfection in Italy, for the specimens contributed to the recent Exhibition at Florence, some of which may be even now on their way to this country, were quite equal to anything produced in the palmy days of the Medici.

It would take too long now to describe the practical processes adopted in this and other modes of mosaic working, and, having already given them in a work I published in 1848 on the subject, and in a report to the Board of Trade made in 1855, it is better to refer you to those sources of information than to further detain you from entering upon what is, indeed, the most practically interesting section of our inquiry this evening. Before commencing, however, upon the second part of our subject, the theoretical basis upon which we should, as architects, aid in the revival of pictorial mosaic, it behoves us to take stock of the present state of the material conditions likely to affect any such revival. In Italy, as I have already said, the art has lingered on, maintained in its monumental form by the necessities of repairing old works, rather than by the desire to create new; and in its portable form by the incessant demands of foreigners to carry off with them, as pilgrims' marks in the nineteenth century, slabs of what is generally known as "*Roman mosaic*." In France, under the first Republic, an effort was made to introduce this manufacture into Paris, and a "*fabbrica*" was opened by the authorities, under the charge of a Signor Belloni, in the old College of Navarre, in the Rue de la Montagne, Ste. Gervaise. At the "*Exposition*" of the year X, some products were contributed from this establishment, but as it altogether disappears from the catalogue of subsequent ex-

positions, there is every reason to believe that the experiment was abandoned. With this exception I am aware of no attempt made by France hitherto to revive pictorial mosaic. I have not heard of any other efforts, making or made, in any of the other countries of Europe, excepting our own.

Before noting what we are doing in this direction, it may be well to record the progress making in Italy. There are now three establishments in "Italia" (supposing it to be "unita"), at all of which I believe the *smalti*, or coloured vitreous pastes requisite for mosaic working are made, and from which they may be procured. These are each attached to great structures, the mosaics of which require occasional repairs, viz., St. Peter's, at Rome, St. Mark's, at Venice, and the Benedictine establishment at Monreale, near Palermo. Of the products of these establishments, the Roman and Venetian are the best, and the Sicilian the cheapest. Through the kindness of Mr. Penrose, of whose exertions in connection with the revival of mosaic I shall presently have occasion to speak, I am enabled to bring to your notice the following particulars of the relative cost of the products of these establishments. At the Roman Fabrica he was furnished with an estimate for the execution of mosaic (of course, in very fine work) for "*opere di decorazione*," at the following rates, reduced to English feet and English money:—For figure subjects or landscapes, at from £23 to £38 per foot superficial; for flowers or animals, at from £23 to £31 per foot; for Grecian, Roman, or cinque cento ornaments, at from £19 to £27 per foot; and for Byzantine ornaments, at from £3 17s. to £11 10s. I cannot help thinking that there must have been some misunderstanding with respect to the above estimate, for such prices might justify the very minute work requisite for copying highly-finished pictures, but are altogether unreasonably high for ordinary decorative work. I am led to this conclusion because Ciampini tells us that when Clement VIII., in the beginning of the seventeenth century, commenced the embellishment with mosaic of the dome of St. Peter's, the price offered for the labour was about £1 10s. per English foot. This was so profitable to the workmen as to attract the labourers from all parts of Italy "*fama tam innodici pretii*." The consequence was that very speedily the price fell to about 7s. 3d. per English foot. This would be, of course, exclusive of the value of the material employed, which latter would be worth then probably about 15s. an English foot. Allowing for a great increase of value since Clement VIII.'s time, it is hard to suppose that similar work could be worth more than about £3 sterling per foot at the present time. This would agree pretty well with what the director of the mosaic establishment at St. Mark's, Signor Moro, told Mr. Penrose, viz., that the cost of finished work, similar to the ordinary Byzantine, would be about £3 2s. per English foot. With respect to the cost of the Venetian material, I have myself obtained from the Count Cornaro the prices at which Signor Salviati, the practical manufacturer who makes for St. Mark's, will supply the *smalti*, viz., for gold and silver, 12s. per pound, cut into tesserae; 6s. for the same quantity uncut. For varied colours, 3s. per pound uncut. Count Cornaro states that it will take about 33 English pounds' weight of gold and silver, or 50 lbs. of coloured smalto to do a French metre superficial of mosaic; the French square metre being rather more than an English superficial yard. Mr. Penrose remarks that at Palermo the price is much the same as at Murano for the smalto, but that the price for cutting it into small pieces is very much lower in the former than the latter place; thus the prices for cutting only, at Murano, are, for coloured smalti, 6s. 8d., and for gold no less than 15s. 6d. per English foot; while at Palermo, for 4s. 7d. per foot, the manufacturers will cut up into tesserae golden and coloured smalti indiscriminately. Mr. Penrose's object in making these inquiries was to ascertain how far it was practicable to enlist foreign assistance in carrying out some of his proposed decorations in St. Paul's in mosaic, of a more pictorial nature than we had at the date of his last visit to Italy succeeded in producing.

The notes he made become now, happily, of less importance than they then were, owing to the fact that with the exception of the gold ground mosaic which our manufacturers have not yet, so far as I am at present informed, been very successful with, all the other foreign pastes may be with advantage replaced by home produce, and the work done by English workmen. The actual purchases made by Mr. Penrose for the purpose of experimenting upon, were as follows:—1,200 cakes of gilt smalto, sufficient, when cut up and wrought, to cover about 80 feet, English, £63; 332 lbs. avoirdupois of coloured smalto, sufficient to do about 128 feet, £35.

In the recent Italian Exhibition the Florentine and Venetian mosaic workers alone were well represented. Salviati, the manufacturer, and Vincenzo Redi, the mosaicist, both of Venice, combined in contributing a fine figure of St. Nicholas, taken from Sta. Sofia, at Constantinople; and an equally good one of our Saviour, copied from an original in St. Mark's. Both of these left nothing to be desired in the way of material or workmanship. Antonio Gazetta, also of Venice, exhibited a very good head. I saw nothing, however, at Florence in these works, which, with the exception, perhaps, of the good quality of the gold ground smalto, we could not, I believe, now rival in this country. It remains for us to see by what steps this newly acquired faculty has been obtained.

The revival of mosaic in this country as an architectural adjunct may be considered to have begun in 1839-40. About which time Mr. Blashfield endeavoured to produce decorative pavements by means of inlaid asphalt, coloured cement, and Venetian pisé works, assisted, by the clever inventions of Mr. Singer, of Vauxhall, by his ingenious assistant, Mr. Pether, and also by Mr. Prosser's mode of producing a tile of great density and closeness of texture, by subjecting powdered China clay to strong mechanical pressure in iron moulds, and in this way obviating the shrinking caused by evaporation, which is unavoidable when the clay is used in a moist state. Mr. Prosser's invention was first applied to the manufacture of buttons, in which for some time a large trade was carried on. Recently the Messrs. Maw have invented a process by which they obtain tesserae with the close texture and consequent hard surface, only to be attained by aqueous shrinkage, and hitherto only approached by subjecting the materials to extraordinary pressure.

Mr. Minton, I believe, at the suggestion of Mr. Blashfield, turned his attention to the application of Mr. Prosser's patent to the production of tesserae suitable for the formation of pavements similar to those of the ancients. Many beautiful geometrical combinations for this purpose were suggested by Mr. Owen Jones, and the result of Mr. Minton's spirited efforts was the speedy introduction to the market of excellent tesserae in all colours.

In 1844, when I went abroad to study my profession, Mr. Blashfield gave me a commission to obtain for him anything which I considered likely to render these tesserae (the manufacture of which Mr. Minton had then just entered on), of more general utility. In Italy and Sicily I found much material, of which I

believed little notice had at that time been taken; and this induced me to make a series of drawings, which I afterwards published in the "*Geometrical Mosaics of the Middle Ages*." These drawings were shown to Mr. Minton by Mr. Blashfield, and on my return to England in 1847 Mr. Minton applied to me to assist him in his views with respect to encaustic tiles, and their combination with tessellated work in general. For some time I rendered him what aid I could, and but for other and more pressing professional engagements I should probably have continued to do so. On Mr. Minton's retirement from active business, Messrs. Maw and Co., determining to add the execution of mosaic to their encaustic tile manufacture, sought my co-operation, which has been given at such intervals as have suited our mutual convenience up to the present time. Feeling their strength quite equal to the production of pictorial as well as geometrical mosaic, Messrs. Maw requested me, on the announcement of the intended Exhibition of 1862, to design a pavement of that character for them. Some of the working drawings for that commission I exhibit this evening, and do not doubt that on seeing the work done from them in the Exhibition, you will admit that Messrs. Maw and Co. have fully proved their capability to rival any antique mosaic yet exhumed in this country. To have attempted successfully such an experiment, involving the production of an indefinite number of tesserae of about one hundred different tints—many never previously got up in England—and the application of skilled labour as it had never before, I believe, been employed in this country since the last Roman quitted it, is, I do not hesitate to say, highly honourable to them as manufacturers; and it is a source of gratification to me to have been associated with them in this the first practical endeavour to revive pictorial mosaic amongst us. That we shall soon have many rivals is not to be doubted, since already, through the energetic and most laudable prompting of Mr. Cole, a scheme has been set on foot to which no one amongst us can, I think, fail to give hearty sympathy and support. Some prospectuses, one or two of which I have laid upon the table, give the detail of a scheme which, if carried out successfully, as I have every reason to think and believe it may, will give a rare impetus to the development of pictorial mosaic. Those details I do not dwell on, for the double reason that time will not now permit of my doing so, and that they will, I believe, form the subject of a paper hereafter at the Society of Arts. I may, however, point to two most hopeful features of progress certainly made, viz., 1st. That already the practical co-operation of many of the most celebrated artists in this country has been secured; and 2nd, both Messrs. Minton and Messrs. Simpson (Messrs. Maw and Co.'s London agents) have proved, that if artists will only make good designs, they possess all the requisite power to realise their designs successfully. To prove this, I need only point to the specimen produced by Messrs. Simpson, which has been kindly lent me by Mr. Cole for exhibition this evening.

Such being the actual conditions of the manufacture at the present moment, I think it will be admitted that it is really incumbent on the studious architect to endeavour to grasp the theory of the right application of pictorial mosaic; and it is in the endeavour to either aid him by my advice, or to aid myself by eliciting a rectification of my views, that I put before you as the second and concluding part of this paper a few convictions on the subject, with respect to which I see my way at present pretty clearly.

The combined action of the moisture and severe frost of our climate is such as must always, I fear, render but little durable any extensive application of mosaic in small tesserae as external decorations; to a great extent, therefore, architects will have to look upon it as an internal embellishment. It is, of course, a coloured incrustation applicable to any structural surfaces which it may be desirable to enrich, and its appropriate design must be strictly determined by very nearly the same laws which should govern the distribution of polychromatic decoration, executed through any other medium upon similar surfaces. The rationale of these laws has been by no one better illustrated than by Sir Charles Eastlake, in his invaluable reports to the Fine Arts Commission; and it is better that I should refer you to what he has so well written in those documents than attempt to give you now any paraphrase of my own. The chief exceptional conditions are, firstly, its expense, which entails simplicity; secondly, the extremely vivid way in which it reflects light, and exhibits local colour partially, demanding judgment to adapt the design to the mode of lighting; and, thirdly, its limitations, under ordinary circumstances, as a means of artistic expression, which lead to the prudent avoidance of many of those pictorial elements, such as perspective, foreshortening, lively action, or complicated chiaroscuro, which are proper and agreeable sources of effect in mural paintings, executed with more tractable vehicles. That which the designer will probably at first feel to be his greatest difficulty, the arrangement of the cement joints which attach the tesserae to one another, will, when once he has mastered the principles upon which they should be disposed, prove a ready and most essential means of heightening his effects. The jointing is, to a mosaic designer, exactly what the lines and reticulations of an engraving or etching are to an engraver; and the rules of taste which apply to the one apply equally to the other. For instance, as the engraver's lines by convexity or concavity express the undulations of drapery, and the modelling of surfaces advancing to or retreating from the spectator's eye, so precisely should the directions of the jointing of a piece of pictorial mosaic. Again, as the regular ruling or cross hatching of an engraved half tint is made to give value to the broken lights and shades of the leading figures, to which, by their vivid contrasts, attention has to be attracted, so precisely should the uniformity of the jointing with even-sized tesserae diminish the brilliancy of a mosaic background, breaking up the light which would otherwise be so strongly reflected from, say a white or golden background, as to quite kill the effect of the figures or ornaments to be relieved upon it. Another point which should be carefully attended to in arranging the jointing is to allow a row of tesserae of the same colour as the ground to always follow every leading contour profiled upon the background. The use of this rule, which was invariably followed by all good mosaicists, is to prevent the directions of the generally horizontal and vertical jointing lines of the background from cutting awkwardly against the profiles, which the eye should be allowed to follow without being led off into other channels, or distracted by the occurrence of irregularly shaped tesserae next to leading forms. This reduplication, as it were, of mosaic outline, has almost the effect of the lead line in stained glass, and is not much less essential to good effect. It is highly gratifying to observe the degree of judgment with which the mosaicist has emphasized the designer's intention, by a judicious treatment of the jointing in Messrs. Simpson's specimen here now exhibited. It is always to be remembered that at the distance from the eye at which mosaics are usually likely to be placed, mechanical defects disappear, but that artistic mistakes betray themselves, despite the most perfect mechanical

execution. Hence it is far better to spend time, thought, and money, in getting really first rate cartoons, than in endeavouring to bring the tesserae to fine joints, or microscopic minuteness. In mounting to the summit of the great dome of St. Peter's, glimpses are caught from time to time of the nature of the mosaic work, and the observer who, from below, may have fancied the whole to have been wrought with great exactness, will find that the work is of the coarsest description, with joints in which often a good sized pencil might be laid. From its judicious design, however, the effect of the whole is eminently satisfactory when viewed from the floor of the cathedral.

It may be well to remember also that although mosaic is, as it were, painting, it is something more in its relation to the structure it decorates; it has become "bone of its bone," and in virtue of its intimate and permanent union is especially bound to live in peace and harmony. As a good wife should make conspicuous the virtues of the husband she adorns, should hide his faults and screen his defects, so should a well-devised system of mosaic give, by predominant vertical lines, height to a structure in which height is wanting, and, by predominant horizontal lines, length where length is needed. Brilliance may be wrought out of darkness by allowing gold ground and luminous colours to prevail, whilst the eye, in another building, "faint with excess of light," may be refreshed by a preponderance of cool and quiet tones. Stringcourses and borders, archivolts and impost bands and friezes, should be treated as permanent frames to permanent pictures, essential, by their rectangularity or other simple geometrical character, to afford the eye a ready means of testing all adjoining and more complex forms by contrast. Need I say that where the skeleton of the picture's composition is tossed about in lively action, a stronger boundary of more vivid and contrasted hues must enclose it as a corrective, than when the motive of the picture is of a quieter and simpler structure. That is the reason why the great Venetian pictures demand such massive framing, while the more serene compositions of the early Florentine and Siennese schools look best when separated one from another by little else than narrow bands of flat and softly tinted ornament. In the same way in mosaic, the rigid saints of the early Byzantine school, with their evenly balanced limbs and perpendicular draperies, need little else than vertical palm trees or inscriptions, or even upright staves placed between them, to keep them architectonic; while the later corresponding figures of the Italian school, with their swaying lines, require often actual insertion into niches to keep them even reasonably quiet.

Such are a few of the most important theoretical points which have occurred to me; but, had time permitted, I would willingly have entered this evening upon—what I have, indeed, partly prepared—an analytical sketch of the different artistic conventions, which form graduated stages between the crudest mode of, as it were, symbolising nature, and the most highly perfected form of imitative art. While an intimate acquaintance with the specific conditions of each of these stages—which are to the designer what keys are to the musical composer—will be a great assistance to the mosaicist, an ignorance of, or an indifference to, them will lead him into great trouble and confusion.

In bringing this paper to a close, I may be permitted to say a few words with respect to specific style as affecting pictorial mosaic. We have seen that, as a decorative art applicable to monumental structures, it has survived every fluctuation and vicissitude which have affected architecture from the Christian epoch to our own time—as certainly will it outlive the little differences which split us up into Goths and Greeks—"big and little endians" of the professional golden eggs. We are now probably on the eve of introducing a new element into our national art, and happily one which may with precedent, and therefore with a good conscience, by those who lean heavily on precedent, be used alike in buildings of whatever historic style we may any of us peculiarly affect. Let me then express a hope that it may not be considered necessary to retain the defects and mannerisms either of too much or too little academic knowledge, peculiar to ancient, mediæval, or modern times; but that we may rather concur in doing the very best we any of us can with this art, without pedantry or a slavish deference to the past. The whole history of monumental and industrial art has shown us, that never is perfection attained in any product in which the material conditions, and the processes by which those conditions may be best enhanced and developed, have not formed the basis of the theory of construction, manufacture, or application, of any such product. This has held good of glass, stone, wood, marble, and of all the metals, and assured am I that, if we are to make this art of pictorial mosaic a credit to the nineteenth century, a similarly "objective" spirit must also direct and determine the specific mode in which, under every varying condition of style and historical association of ideas, we would endeavour to rival the great masters of old in their use of this time-honoured embellishment.

THE ESTIMATES FOR PUBLIC WORKS AND BUILDINGS.—The estimates for the public works and buildings for 1862-3 are—Royal Palaces, £33,583; Public Buildings, £89,510; Furniture of Public Offices, £14,611; Royal Parks and Pleasure Gardens, £84,664; New Houses of Parliament, £32,647; British Embassy Houses Abroad, £5,104; British Consulate, Constantinople, £450; Westminster Bridge Approaches, £2,500; New Westminster Bridge, £1,231; New Foreign Office, £15,000; Temporary Foreign Office, £1,250; Industrial Museum, Edinburgh, £10,000; Aberdeen University, £903; Probate Court and Registries, £10,000; National Gallery, £1,705; National Gallery, Dublin, £2,500; Harbours of Refuge, £150,000; Holyhead and Portpatrick Harbours, £101,221; Public Buildings, Ireland (including Kingstown Harbour), £96,342; New Record Buildings, Dublin, £5,000; Lighthouses Abroad, £11,904; Highland Roads, &c., Commissioners, £5,000; Rates for Government Property, £20,000. The entire estimate in this class is £695,215, showing an increase in some departments of £107,741, and a decrease in others of £247,192; the net decrease as compared with 1861-2 being £139,451.

GUANO AS A POLISHING POWDER.—The *London Review* says a compound of guano (100 parts), fine tripoli (25), common sea-salt (10), and wheat flour (12), is now being used for polishing metals and glass. Diluted alcohol is the vehicle for applying the powder.

A SUBSTITUTE FOR TURPENTINE.—A new product, which bids fair to compete with, if not to supersede, turpentine, has recently been obtained. It is distilled from petroleum and asphaltum. The Asphaltum Company have succeeded in producing this spirit, which can be used in the place of turpentine, without danger or fear. And as it can be obtained at one-third of the price cheaper than turpentine, it is likely to be extensively consumed.—*Mechanics' Magazine*.

WORKS AT WORCESTER CATHEDRAL.

WORCESTER Cathedral has for some time past been undergoing renovation by the Ecclesiastical Commissioners, under the direction and superintendence of Mr. Perkins, of Worcester, architect. "In a few months the whole of the cathedral, from the great transept to the east end, including the choir, the Lady and other chapels, will have undergone a restoration of the completest character, and the public will have an opportunity of viewing this portion of the building pretty nearly as it stood before its Early English features were disfigured by the introduction of details belonging to later styles, or the barbarisms appropriate to the dark period between the Reformation and the recent revival of taste for Gothic architecture." The south side, east of the great transept, is now nearly completed; the work to the south aisle of the choir has been completed, and the chapel connected with it, recently used as a vestry. The windows of this chapel were in a very bad condition. The outer wall has been refaced where necessary. The corbel table and parapet have been restored, and Early English windows inserted. Some fears have been entertained that the groined roof of the aisle and chapel would require extensive repairs, but on removing the thick coats of whitewash and plaster that hid the masonry, it was found that a comparatively small expense would place the roof and the ribs of the groining in a sound condition. The groining will be pointed and grouted, and the materials left in their natural colour. The improvements on this side of the choir being nearly completed, the works are now being pushed forward on the north, and here a serious undertaking had to be encountered, arising from the condition of the smaller transept. From the ground to the apex of the gable of this transept the distance is at least 120 feet, and the masonry of the walls, piers, and buttresses is proportionately massive. The transept is in such a state that one of the piers—that near the stone pulpit in the choir—will have to be taken out and rebuilt; the windows on three sides will also require taking out and the walls above them rebuilding.

The floor of the choir and the steps leading up to the altar have been taken up, in order to allow of the erection of a framework of timber to support the roof of the transept and the groining connected with it, whilst the defective pier is taken down and rebuilt. This framework rises nearly to the springing of the arches, and holds up large horizontal timbers that take the weight which naturally rested on the faulty pier. At higher points the groining is supported in such a manner as to keep it firmly in its place during the rebuilding of the pier and such portions of the walls as require it. The wall which shuts up this transept from the choir is also partly pulled down, with a view, we believe, to its entire removal. In addition to the faulty pier above referred to, it will be necessary to rebuild nearly the whole of the arch of the first bay from it, going westward. Considerable progress has been made outside the building on this side, between the two transepts. The walls have been refaced wherever it was necessary; the corbel table and parapet have been restored, and the Perpendicular windows have given place to Early English. In the clerestory, the new windows are lancets in triplets; in the aisle, they are alternately two and three lancet lights under one common arch. We are told that vestiges of the original work remained to guide the architect in removing that of later periods, and putting in the new. The smaller transept still retains what are believed to be the original lancet windows, but these have been filled with tracery. The roof of the aisle will be renewed, and restored from nearly a flat to its original pitch. It has not been deemed advisable to remove the flying buttress which aids in supporting the wall and the clerestory, but it has been refaced and restored. These works will nearly complete the restoration of the Early English portion of the cathedral. The workmen are now busy with the great transept on the north side, which is Perpendicular. Mullions run from the top to the bottom of the principal window of this transept, and render it one of the ugliest that could disgrace a cathedral. A new window is to take its place, and as the opening is large, and the window is a principal feature of the edifice on the only side on which a full length view of the building can be obtained, we have no doubt that the architect will take advantage of the opportunity to put in a window that will be worthy of the situation. The fragment of the old conventual buildings lying between the Chapter House and the transept will probably be used for vestries and like purposes.

We have extracted the foregoing from an article in the *Worcester Journal*. The *Athenæum* speaks of the restorations as follows:—

"Every admirer of old carving will bear with regret that the beautiful works filling up the spandrels over the wall-arcade that runs round the east end, and its transepts, of Worcester Cathedral have been retouched with so ruthless a chisel that all their former beauty of execution has been destroyed. These carvings were amongst the most admirable in the country, being remarkable for fine and graceful treatment of drapery, which throughout had that peculiar flow and elegance which distinguish the best ages of Gothic sculpture and mark the intense love of his work which the carver had. They displayed finish without toilsomeness, conventionality without stiffness, natural ease and mastery of beautiful form. Now their place is taken by the poor and forced feeling for form in which some mechanical carver has recut them. No one but an artist executed these works; few artists, none without a reverent spirit, should have touched them. How often are the custodians of our ancient works of art to be told that restoration by common hands is ruin? It would have been better to have taken these things away altogether out of the wall, for preservation elsewhere, and to have replaced them with copies, which would have been no worse in character than are the originals. As now mutilated, it is lamentable to see them, every sweet and thoughtful curve and delicate line of loving study has been scraped down to the poor form of a Birmingham metal casting. All richness of surface has, of course, vanished. Extensive 'restorations' are yet going on in the Cathedral, of the general merit of which we do not desire to speak until they have passed over the edifice. To the east end of the building these are at present confined. In the great east window was of yore a good deal of old glass, composed of fragments from many minor lights, it is true, but skilfully enough arranged. All this has gone, and its place given to a weak, poorly-tinted and commonplace example of stained glass. The old glass has been removed, as far as we can learn, entirely from the building; which is a sad mistake, seeing that there was enough, skilfully managed, to have filled half-a-dozen of the smaller windows in the clerestory. It is to be hoped that some heed will be given to these matters of glass and carving before further works are undertaken in this cathedral. Triple-lancet lights are being placed in the parts that are being 'restored' in place of the old, but certainly not original windows. All lovers of ceramic art will remember the tiles, with their armorials and many patterns, which rendered the old singing-school of this cathedral so famous. We learned, in the building itself, that most of these are destroyed, and saw that the result of some excavations beneath one of the

PART OF THE WEST FRONT OF ST. GUDULE, BRUSSELS.

apartments had been to bring down the floor. We must not omit to add, that while the old glass from the great east window has been removed, without thought it would appear, a foolish seventeenth-century transparency in glass, standing in the eastern light of the north (chancel) aisle, has been religiously preserved. The Guesier Hall, about which there was much discussion some time since, stands as it did."

Then we have a letter from a correspondent, who says that the foregoing account of the injury done to the sculpture, and the observations upon the works generally now going on at the cathedral, are "quite incorrect, being one tissue of falsehoods from beginning to end."

We may give our own account of the restoration before long.

ON BUILDING STONES.

THE following is the substance of a paper read before the Civil and Mechanical Engineers' Society, on the 13th inst., by Mr. J. B. WALTON, V.P.:

Arenaceous or siliceous rocks are generally composed of grains of sand, which are rounded as if by the action of running water, and bound together by some calcareous or siliceous cement. These rocks, which are termed sandstones, are sometimes found with the grains of sand extremely coarse, and, again, delicately fine. This coarseness or fineness is, however, of trifling importance in comparison with the nature of the materials by which the particles are cemented. Many sandstones have their parts so loosely united as to be totally unfit for building purposes, this being the nature of the rock which underlies the town and castle of Nottingham. Purely siliceous sandstones are admirably adapted to withstand the influences of wind and weather; but where there is an admixture of siliceous with other materials, great skill is required to select a durable building stone.

Argillaceous rocks scarcely admit of a general description, but most of them emit a peculiar earthy odour when breathed upon, and consist of silica and alumina, with small proportions of lime and magnesia.

Cretaceous rocks, or limestones, are composed of lime and carbonic acid. Many of these stones consist of fragments of shells and corals, which are united by means of a calcareous cement. Those belonging to the oolitic group are found to consist of small egg-like grains, each of which has a particle of sand for a nucleus, around which are formed concentric layers of calcareous matter.

Limestones and sandstones of the same specific gravity are found to exhibit the following relations:—As regards the resistance to a compressive force, the sandstone has a superiority over the limestone nearly in the proportion of three to two; the absorbing power of the sandstone is less than that of the limestone, as the former absorbs .007 of its bulk, while the latter absorbs .114. The sandstone will be composed of silica with a small percentage of carbonate of lime, and the limestone will consist chiefly of carbonate of lime with small quantities of silica and magnesia.

The author then reviewed the building materials of the Pliocene, Eocene, and Wealden deposits, describing more particularly the Kentish rag of the lower greensand series, and the Sussex and Purbeck marbles of the Wealden formation. The latter were stated to have been much employed in the embellishment of our ecclesiastical edifices in the middle ages.

The oolitic rocks were next described, and full particulars were given of the Portland, Ancaster, Bath, and Ketton limestones. It was remarked as a singular fact, that with reference to the oolitic rocks, the top beds are invariably the hardest, while the lower are extremely liable to decay. Portland stone was stated to be far superior to the Bath and other stones of this formation, and also to be decidedly the best material to withstand the trying influences of the London atmosphere. The average weight of Portland stone is 135½ lbs. to a cubic foot, its specific gravity 2.145, and its absorbing power 0.206. The analysis of this stone as given by the Commissioners in their report of 1833 is as follows:—

Silica	1.20
Carbonate of lime	95.16
Carbonate of magnesia	1.20
Iron and alumina50
Water and loss	1.94
	100.00

The analysis of the Ancaster, Bath, and Ketton stones, according to the same authorities, is as follows:—

	Ancaster.	Bath.	Ketton.
Carbonate of lime	93.59	94.52	92.17
Carbonate of magnesia	2.90	2.50	4.10
Iron and alumina80	1.20	.49
Water and loss	2.71	1.78	2.83
	100.00	100.00	100.00

The oolitic stones of Oxford and Northampton were next referred to, particular notice being directed to the yellowish and rusty appearance of the buildings in these vicinities, and to the lamentable symptoms of decay which many of them exhibit.

The Permian or magnesian limestone series was then next described, and particulars were given with reference to the selection from these deposits of the material for the construction of the New Houses of Parliament. The Commissioners first recommended the Bolsover quarries, from having observed that the Norman porch of Southwell Minster, which was supposed to have been executed in this stone, was as free from decay as when it was erected eight hundred years back. These quarries were, however, abandoned in consequence of the stone being small in bed and difficult to remove from the earth. The Anston beds, in Yorkshire, belonging to the Duke of Leeds, situated about five or six miles from Bolsover, were then examined and found to fulfil the requirements of the Commissioners, so this stone was adopted, and delivered in London at the rate of 200,000 cubic feet per annum for several years.

Numbers of buildings have been executed in this material, both in London and the country, and instances were given in which the stonework is already suffering much from decay.

The analysis of the Anston stone is as follows:—

Carbonate of lime	54.89
Carbonate of magnesia	42.07
Protoxide of iron	0.49
Peroxide of iron	0.55
Silica	0.51
Water	0.24

The magnesian limestones of this district were stated to be very numerous, and

to vary but slightly in their chemical constituents; that quarried at Mansfield Woodhouse, in Nottinghamshire, was described as being more durable than the Anston stone, but so expensive to work that it is but seldom employed. It was used by Mr. Gilbert Scott in the construction of the Martyrs' Memorial at Oxford, in 1840, and is found to stand remarkably well.

The Cragleith and Bramley Fall sandstones of the carboniferous system were described at some length, and were stated to be admirably adapted to resist a great compressive force, and to withstand the varied influences of weather, wind, and water. The average weight of a cubic foot of Cragleith is 146, and of Bramley Fall, 142½ lbs. The latter is capable of withstanding a pressure of 109,000 lbs. to a cubic foot, which is nearly the amount safely sustained by Portland. The piers of the railway bridge at Pimlico and Fulham are constructed with this material.

For the Silurian, Cambrian, and Devonian systems all furnish excellent materials for building, and were described at some length by the author.

A review was then given of the igneous or unstratified rocks, particular mention being made of granite, syenite, and greenstone. The decay of granite was briefly noticed, and accounts were given of the strength of several varieties of this material, including the Aberdeen, Peterhead, and Cornish granites. The Aberdeen granite is considerably lighter than that quarried in Cornwall, but possesses nearly double the resisting power to a compressive strain.

Particulars were given with reference to the expansion of stones, and an account of some experiments recorded in the "Transactions of the Royal Society of Edinburgh" was related, from which it appeared that the building stones in common use expanded nearly in the same proportion as cast iron.

The author concluded his paper with some observations on the decay of stone, and made especial reference to the decomposition of the materials employed in the construction of the Houses of Parliament. An analysis of the evidence taken before the committee appointed to inquire into the decay was given. It appeared, from the evidence of Mr. C. H. Smith, one of the commissioners of 1838, that the stone was all taken indiscriminately from the quarry, and that the selection was left to persons who had little knowledge of the subject. The decay was stated to be most apparent in all damp and sheltered situations, the stone being in good preservation in many places where it was exposed to the full action of wind and weather.

PART OF WEST FRONT, ST. GUDULE, BRUSSELS.

WE gave, at page 91 of our present volume, a view of the south entrance to this interesting church, and are now able to present our readers with an engraving of a portion of the western façade, showing the principal entrance on that side. To the notes accompanying our former illustration we may add that the west window dates 1528, that the church was restored to some extent in 1843, while more extensive restorations were commenced in 1859. In the interior the carved pulpit, by Verbruggen, representing Adam and Eve driven out of Paradise, is well known; it is said to have been executed for the Jesuits at Louvain, and to have been presented to St. Gudule by Marie Thérèse.

ANCIENT INDIAN TOMBS.—On the 18th inst. Mr. W. Bollaert read a paper before the Ethnological Society "On the Ancient Indian Tombs of Chiriqui in Veragua, Isthmus of Darien." Columbus, in his last voyage, discovered the east coast of a region on the mainland of America, called Veragua. The burial-places of the aborigines of this district were by accident, in 1859, found to be treasures of golden ornaments. They contain also antique baked pottery of rude but chaste and not inelegant forms. Everywhere throughout the country their tombs are found, and monuments and columns covered with figures are met with. The Chiriqui tombs were opened in great numbers in the year referred to (1859), when, at one time, no less than 1,500 persons were engaged in digging and ransacking the graves at Bugabita—a plain of a mile square, surrounded by high mountains. Two hundred and fifty pounds' weight of gold was obtained in less than three months, of the estimated value of £12,500. In the centre of the plain is a mound of stones four or five yards high, and all round it are the "huacas de depositos," or graves, containing gold. Outside of these are other graves, the "huacas de sepultura," which are of a poorer sort, and contain none of the precious ornaments. The "huacas de depositos" are formed with stones laid on the surface in fives, in the form of circles, crosses, parallel rows, semi-circles, rings with four equi-distant large blocks, and in other definite forms. Many other rich tombs have since been elsewhere discovered, and the whole of this portion of the isthmus appears to be a vast cemetery. Amongst the gold objects are bats, frogs, alligators, tapirs—all of new world types—the guacamayo, or "sacred parrot," and figures of hideous, obscene, or grotesque forms. The tombs and their contents the author considers to be about seven or eight hundred years old, and to have been the work of the Durschos—a race he conjectures to have been derived from the Chorotegan nation of Nicaragua. Such monuments as the "Piedra Pintal"—a great stone 50 feet long and 15 feet high, near Caldera, covered with representations of the sun, human heads, scorpions, and other figures, he believed to be of much older date, and carved by an older people than the Durschos.

THE EXCAVATIONS AT CYRENE.—Mr. Vaux read a paper before the Royal Society of Literature on the 12th inst., on the Excavations of Cyrene, in which he gave an account of the researches which have been recently instituted at that place by Lieut. Smith, R.E., an officer who was associated with Mr. Newton, when he was engaged in the excavations at Halicarnassus. Lieut. Smith spent several months during the winter and spring of 1861 at Cyrene, and was fortunate enough to make a series of discoveries which have greatly enriched the national collection. Among these is a statue of Apollo Citharæus, which is considered to be a genuine Greek work of the Macedonian or post Alexandrian age; or a copy of a first-class work of that period, made during the Augustan times. Besides this, nearly 200 other objects of greater or less interest were found, among which are statues of Diana, Bacchus, Esculapius, Venus, &c.; some busts of Roman Emperors, such as Antoninus Pius, Aurelius, Faustina, Jun., and a large number of statuettes, some very small and perfectly preserved, and some curious bas-reliefs.

ON THE SEWERING OF TOWNS AND DRAINING OF HOUSES.*

TOWN sewerage on a grand scale is certainly co-existent with the Roman Empire, and earthenware pipes are, probably, as old as the art of pottery. It has been ascertained that pipes of earthenware, "hand-thrown" on a potter's wheel, and not unlike, in form and dimensions, to hand-made pipes of the present day, were used throughout the East in the remotest periods we are acquainted with, to conduct springs of water for human uses.

Earthenware pipes have been found beneath the great mounds of Assyrian ruins, which pipes are supposed to have been drains; and the stalls in the Colosseum of Rome were drained with earthenware pipes. Earthenware pipes were also used by the Romans for watercourses.

The cloaca of Rome, including the Cloaca Maxima, according to Livy, are as old as the reign of Tarquinius Superbus. Some authors declare that the construction of these public sewers must belong to an Etruscan nation, which preceded the birth of Romulus and Remus.

These old sewers, the ruins of which are to be seen in Rome to this day, were also "subways" and sewers, having raised paths along the sides, and "side-entrances" for tributaries from palaces and fountains. There were large cloacae in the several cities throughout the empire, as—see Pliny's letters to the Emperor Trajan. I have met, in the works of the travellers, with descriptions of other ancient sewers and drains found beneath ruins in the East, the date of the formation of such sewers being lost in the darkness of antiquity. It is, no doubt, impossible to trace out the origin of sewers and drains; their "invention," construction, and use, probably took place and commenced with civilisation. We cannot, however, settle this point now. We have another purpose, namely, to discuss the uses and the abuses of sewers and drains at this day.

The Roman cloacae were, probably, in many instances, of the character of the great sewers in this metropolis—the Fleet, the Ranelagh, and others—watercourses enclosed and arched to serve as sewers.

The remains of sewers and drains found amidst ruins show us that their application was limited, and their uses only imperfectly understood. If sewers and drains had been generally in use amidst the populous cities and towns of antiquity we should now find their remains abundantly. We know the extent of the Roman Empire more fully and better by the buried remains of Roman pottery than by history, or than by any ruins or traces of ruins remaining on the surface. Brick sewers and earthenware pipe drains, if they had ever existed, would have been as enduring in their materials as frail pottery, or as the stone and brick cloacae of ancient Rome and the drains of the Colosseum. We do not find such remains in abundance, and therefore conclude that a limited construction only took place for special purposes.

The Roman cloacae were originally under the superintendence of the censors; subsequently under that of the aediles. The Emperors Agrippa and Trajan constructed many cloacae during their reigns. We, in these modern times, divest our Imperial Government of all such useful power.

Earthenware pipes, of three and four inches diameter, were made in England more than half-a-century since, in Lambeth and in other places. Mr. Doniton, Sen., can recollect their being made during this space of time, and I have received other evidence as to the make of earthenware pipes forty or fifty years ago in England. The first modern use of them, for sewer purposes, was suggested by Edwin Chadwick, Esq., C.B., soon after the year 1840. Mr. John Roe states in his Report to the Harrow Local Board of Health (1854):—"The introduction of stoneware pipes for general drainage arose from a suggestion made by Mr. Chadwick to me, in his desire to obtain smooth interior surface; and the first sewer pipes made for that purpose in the metropolis were for the Holborn and Finsbury office, in consequence." Mr. Roe further states, "Immense benefit to sanitary measures has been afforded by the use of earthenware pipes, where judiciously applied and properly laid. They save fully two-thirds the cost of brick sewers; that is, where brick sewers for a town would cost £50,000, the same town may be sewered by earthenware pipes for a cost of £10,000, and the cheaper pipes will effect the work far safer to health and life than the costly brick constructions. Combined back drainage is of the utmost importance, in point of economy, and also in efficiency of working, where the drain pipes are properly laid. There are many thousands of instances of successfully combined back drainage, in scores of towns, and complaints of failure or of annoyance are very rare. I do not think they amount to 1 per cent. upon the work executed." Mr. John Roe, in 1854, states that, "Thirty-six years previously (1818), 200 houses on one estate, in the Holborn and Finsbury districts, had combined back drainage, and no complaint of their working or otherwise ever came in that period of time to the office." Mr. Roe further states, "In many country towns and places, back drainage may be usefully adopted." This is the doctrine of the first Board of Health anticipated and confirmed. In some places back drainage will be impracticable, and, of course, should not then be adopted.

It is a great advantage to have a regular flow of water through any sewer. Drains are choked more from want of water than by having too much passed through them. Combine drains as much as practicable, lay them well, joint them evenly, properly, and smoothly, and there will be very few if any chokings.

Fully to understand the worst effects of want of sanitary arrangements in towns, we must go back to the days of the plague, sweating-sickness, and other similar diseases, and read up the literature of 1600 and 1700, by Nathan Hodges, M.D., on the Plague of London, 1665; a Discourse on the Plague, by Dr. Mead: an Essay on the Different Causes of Pestilential Diseases, by John Quincy, M.D., and others; until we come to James Lind, M.D., and Sir John Pringle, the one on diseases in the navy, and the other on diseases in the army. We may then visit the cities and towns in the East, where plague rages to this day, and see the causes in existence which prevailed in England two centuries since—some of which causes prevail even now. Filth, squalor, darkness, neglect, vice, crime, and premature death; and annual mortality of 40, 50, and 60 in the 1,000 regularly, with an increase up to 100, 200, and even, in some places, 500, or a moiety of the entire population in one year, of plague and general sickness; "the living too few to bury the dead." The annual mortality of England at present ranges from 30 to as low as 15, and even 11 in each 1,000. It is thought 15 ought not to be exceeded even in our towns.

The Sanitary Commission of 1855 in the Crimea showed what could be done for an army in the field, were the mortality fell below that of the same troops in barracks at home, the French Army knowing no such abatement. When fever had been all but banished from the British army and hospitals, the French at the end of the war were said to be losing by sickness in hospitals at a rate of 5,000 per month; that is 15,000 men died in hospitals during the last three months of the war according to French return.

There are, no doubt, many causes for disease in excess, but overcrowding, defective ventilation, and surrounding filth, seem to be the worst.

Proper sewers and drains will improve a town, but will not do all that is required. The causes of fever in Liverpool, previous to the year 1840, were overcrowded cellar dwellings. The causes in Glasgow and in Edinburgh were overcrowded upper rooms and attics. The narrow streets, crowded houses, and small rooms of many continental towns may be improved by sewerage, drainage, surface pavements, and regular cleansing. But many of the causes of disease in excess might remain.

There are laws relating to sewers from Magna Charta to recent times. Calls, on the law of sewers, is the great authority. These laws, however, relate to sea defences, weirs, rivers, estuaries, and land-floods, rather than to town sewers.

Sewers were first constructed in London under an Act (6 Henry, VI. c. 5), 1428, amended by Parliament in the reign of Henry VIII., and since this period to the present time there have been many amendments and alterations of laws for regulating sewers, into which I do not propose to inquire. The streets of London were begun to be paved in 1533.

The first sewers in London would no doubt be in the several valleys on the line of existing watercourses, the Fleet Ditch, the Ranelagh Level, &c. These watercourses were arched over, and the drainage of the adjoining streets and houses passed into them.

Stowe states that, "Antiently, until the time of the Conqueror, and two hundred years later, this City of London was watered (besides the famous river of Thames on the south part), with the river of the Wells, as it was then called, on the west; with a water called Walbrook, running, through the midst of the city, into the river of Thames, sewerage the

heart thereof; and with a fourth water, or bourn, which ran within the city through Langbourn Ward, watering that part in the east. In the west suburbs was also another great water, called Oldborn, which had its fall into the river of Wells."

The Fleet Ditch (*) was no doubt originally (in ordinary weather) a stream of bright, sparkling, sweet, and wholesome spring water—a river of "wells." But as early as 1290 the monks of White Friars complained to the king that the putrid exhalations arising from the river of Wells or Fleet were so powerful as to overcome all the frankincense burned at their altars during divine service, and even occasioning the deaths of many of the brethren. The Fleet continued to receive additional impurities, until it became in the time of Pope—

"The king of dykes, than whom no sluice of mud
With deeper sable blots the silver flood."

Barges are said to have sailed up the Cloaca Maxima and the Fleet sewer alike; in both instances natural watercourses having been arched over and made the receptacles of sewage.

Although the first formation of public sewers in the British metropolis dates so far back as 1428, by far the greater portion of the 1,500 miles of the main sewers in London have been constructed since the year 1824, Mr. John Roe having had the perseverance, honour, and credit of effecting more improvements in the main sewers of his districts, Holborn and Finsbury, up to the end of his period of service, than any other man. The improvement of adopting the egg-shape, in place of vertical sides, for sewers, the introduction of side entrances, and means of flushing, and the experiments carried out by Mr. Roe, and tables based on these experiments, are invaluable for the metropolis. Mr. Roe found the construction of sewers a matter of guess; he left it a matter of scientific certainty. If all the sewers of this great metropolis had been laid out and constructed on the plan proposed and adopted by Mr. Roe in his divisions, vast additional sums of money would have been saved, and (humanly speaking) many lives prolonged; the flat-bottomed sewers which now exist would have had semicircular channels, and the deposit which now accumulates and corrupts would have been regularly washed out, or periodically "flushed" out at short intervals. Mr. Haywood has more recently done for the City what Mr. Roe did for Holborn and Finsbury.

The ventilation of sewers by vertical shafts and open grates in the centres of the streets was, no doubt, an improvement, though a very clumsy and disagreeable plan. Previous to the formation of these open ventilators, typhus and typhoid fevers prevailed in many houses connected by drains with the sewers and near to the untrapped gully-holes.

Mr. Fuller, a medical gentleman, in his evidence, 1834, states that eight-tenths of all the cases of typhus fever he witnessed he could trace to foul drains or foul gullies. The late Dr. Southwood Smith gave evidence to the same effect.

At present there is much injury effected by sewer gases passing through drains and into houses. In 1859, on the use of a disinfectant in the public sewers having a powerful odour, all the houses directly drained by these sewers were tainted, showing that there was a flow of air from the sewers to the houses. This should not be, and can only be avoided by external ventilation of each house-drain.

The question of sewerage and drainage concerns the poor more than the wealthy. Firstly, on account of numbers; and, secondly, because of close crowding. The poor must live, or linger rather, in squalor, sickness, and misery, and die prematurely, in such habitations as are provided for them. The fatal room tenements in English towns, the mud cabins of Ireland, and the booths of Scotland, all tend to fill our gnoles, lunatic asylums, and workhouses. When shall we learn and fully comprehend the fact that it will be more in accordance with the requirements of civilisation, and even more economical, to prevent vice, and to make virtue possible, rather than to expend all our energies on reformatories, to make home comfortable rather than to build and endow public libraries, lecture-rooms, and reading-rooms? Do not neglect these, but first make the poor man's home wholesome.

The preponderance of numbers is shown in the case of Manchester and Salford. From a return by the Poor Law Board of the numbers and occupiers of dwellings in parliamentary boroughs, it is shown that in Manchester, in 1859, there were 64,426 separate dwellings, of which number 24,457, or 38 per cent., were of £10 annual rental or upwards; 22,538, or 35 per cent., below £10 and above £6 rental; and 17,431, or 27 per cent., not exceeding £6; or, in the whole, about 62 per cent. at and below £10 rental.

In Salford there were 20,156 dwellings; 5,205, or 26 per cent., of £10 rental and above; 8,131, or 40 per cent., of £6, and below £10 rental; 6,820, or 34 per cent., not exceeding £6 rental.

Taking Manchester and Salford in one district, there were 84,582 dwellings, of which 29,662, or 35 per cent., were £10 rental and upwards; 30,669, or 36 per cent., of £6, and not exceeding £10 rental; and 24,251, or 29 per cent., at and under £6 annual rental.

Many of the houses below £8 per annum rental are of faulty construction. They are generally in rows, back to back, having no back doors nor windows, no yard nor privy, no sinkstone, nor internal water supply. Many sleeping-rooms have no fire, nor adequate means of ventilation. Privies have to be used in common, and, of course, are not what the name implies; they are frequently ruinous, and sickeningly dirty. Experience has shown that numbers of families should not be compelled to use privies common to several houses, unless regular cleansing is enforced. Every dwelling-house should have its own convenience. It is a libel on the poor to say they will not care for their own comfort. There are thousands of instances to the contrary. In Manchester, for the poor, waterclosets are the exception. The local municipal regulations discountenance them.

The annual death-rate in Manchester is 30.56 per thousand, or double the death-rate in some districts. The death-rate throughout the manufacturing towns of Lancashire and Yorkshire generally is high, and will continue to be so until better sanitary regulations are adopted and enforced.

The excuse offered by the Manchester Corporation is, "supplying the poor with water-closets would waste water and foul the rivers." Proper apparatus will prevent the first, and intercepting sewers the latter.

London shows a diminished death-rate in proportion to the abolition of cesspools, although the sewerage is most defective, and the River Thames is foned. Many thousands of cesspools have been abolished in the metropolis, probably not less than 100,000, within the last twenty years, but many thousands remain. Mr. John Roe, and some of the other district engineers, improved many miles in length of the metropolitan sewers and drains, but there are many miles in length ruinous and foul. London is, however, much more healthy than the manufacturing towns of Lancashire and Yorkshire.

Those who wish to experience the horrible character of the cess-pits, and middens of Manchester, Liverpool, and other northern towns, should study the statistics as they are weekly recorded, of 1,200 and 1,400 such places emptied, and then make a few night inspections of the localities in the hands of the "nightmen"; the stench is abominable, many times worse than the Thames at its worst. The rivers flowing through Manchester can scarcely be worse than at present. The Irwell, the Medlock, and the Irk, are a disgrace to our civilisation. They are fouled from their sources to their estuary; and if the erection of waterclosets could be absolutely prohibited the construction of intercepting sewers should be made imperative. The solids of sewage can be precipitated, but agricultural land is the proper place and use for sewage.

In many cities and towns where sewerage and drainage are carried out, waterclosets are in general use. This is the case in the metropolis. For several years past some 1,000 soil-pans have been made and sold per week, or some 50,000 per annum, and they are, of course, used. In the cities and towns of Berwick-upon-Tweed, Alnwick, Morpeth, Carlisle, Lancaster, Halifax, Worsley, and many other places in England, the poor use this convenience and do not abuse it.

In Manchester 100,000 loads of night-soil are annually removed at a loss of some £6,000 per annum. In London the removal of dry ashes produces an income to the parishes.

There is no general rule for the dimensions of town sewers for populations below 100,000 in proportion to surface area, and any engineer who adopts the dimensions given in certain published tables will most probably make an expensive mistake for the district in which he is operating. The tables which are based on experiments made in the metropolitan sewers are, no doubt, correct and absolute for the districts from which they were constructed, and will be applicable to any other similar district, if all the peculiarities and

* Paper read at the Society of Arts, by Mr. ROBERT RAWLINSON, C.E., F.G.S., &c., March 19th.

* "Fleet." This name is derived from the rapid flow of water from the districts drained.

contingencies are similar; but they are not applicable to towns generally. I have never used these rules, and should have caused great waste of money if I had done so. The science of engineering cannot be tabulated, and this truth ought to be inculcated on every student. As well say that all sorts of diseases can be cured with one set or sort of pills, as that tables of strengths of materials and dimensions of sewers can be relied upon without the experience of practice. The published tables I allude to have worked injury, not only in Great Britain, but all over the Continent, where many sewerage works have been attempted. The civilised world looks to this country for practical information on this subject.

The recorded experiments of the best hydraulic engineers on the flow of water in open channels and in pipes may be relied upon. There is little to learn in this branch of hydraulics. Pipes have capacity in proportion to the squares of their diameters, and water obtains downward velocity in strict accordance with the laws of gravity, modified by friction in its thousands of forms. The invert gradient of a sewer is one element in the law of flow. The head of water and delivery are other elements, giving velocity and scouring power. I only object to tables of sectional dimensions for general use. The town of Alnwick, in Northumberland, with its 2,000 acres of drainage area, its 7,000 population, and some 1,000 waterclosets, is sewered by an earthenware pipe 18 inches diameter, and having a gradient of 1 in 400. Carlisle, with its 1,300 acres of drainage area and 35,000 population, has an outlet sewer of 3 feet 9 inches by 2 feet 6 inches, with a fall of 1 in 700.

At Workop the outlet sewer is an earthenware pipe, 15 inches diameter, laid at an inclination of 1 in 600. The population is upwards of 7,000, and the drainage area very large.

At Lancaster the outlet sewer is of brick, 5 feet 3 inches by 3 feet 6 inches, and laid at an inclination of 1 in 1,000. The population is about 15,000, and the drainage area considerable, having a rapid fall in some parts.

At West Ham, with an area of 4,730 acres, principally of flat water-logged marsh land, the outlet sewer is of brick, 5 feet 3 inches by 3 feet 6 inches, having a cast-iron invert laid level, and at low-water line of spring tides.

In all these cases the dimensions of the outlet sewers do not accord with the tables alluded to, and yet the sewers perform the work required to be done. Surface water and heavy falls of rain pass, as previously, over the surface, but there is not a duplicate system, nor do I advocate such.

At Carlisle the outlet is frequently blocked by land floods. At Lancaster, daily, by tides; and at West Ham pumping is resorted to.*

SUBJECTS FOR MEDALS AND PRIZES OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS FOR 1863.

At a Special General Meeting of the Institute, the following recommendation of the Council, with reference to the Royal Medal for the year 1862, was read and agreed to:—"Her Majesty having been pleased to grant her gracious permission that the Royal Medal be conferred on such distinguished architect or man of science, of any country, as may have designed or executed any building of high merit, or produced a work tending to promote or facilitate the knowledge of architecture, or the various branches of science connected therewith, that the Council do proceed, in the January, 1863, to take into consideration the appropriation of the Royal Medal."

The following recommendations of the Council were also read and agreed to:—

Institute Medal.—That the Silver Medal of the Institute be awarded to the author of the best essay on either of the following subjects:—1st. The application of coloured bricks and terra-cotta to modern architecture. 2nd. The application of timber work in England, constructively and artistically, from the year 1400 to the present time. 3rd. On the stained glass of the twelfth and thirteenth centuries. 4th. On the use of concrete for vaults and roofing purposes. That the Silver Medal of the Institute, with Five Guineas, be also awarded for the best illustrations, geometrically drawn from actual measurement (with dimensions figured, both on the drawings showing the general arrangements, and on the details), together with descriptive particulars, of an abbey gateway, a bridge, or other Mediaeval building in the United Kingdom, hitherto unpublished in that manner. The Council suggest the following as being subjects worthy of illustration, but others may equally well be taken, if more convenient to the competitor:—Cambridgeshire—Gateway at Ely; one of the bridges of the county. Huntingdonshire—One of the bridges of the county. Herefordshire—The Abbey d'Ore in the Golden Valley. Hertfordshire—St. Alban's Eastern Chapels, including Lady and Ante Chapels. Middlesex—Ely-place Chapel, London. Nottinghamshire—The Chapter House, Southwell; west front of Newstead Abbey. Somersetshire—St. Joseph's Chapel, Glastonbury; King Ina's Palace. Shropshire—Lilleshall Abbey. Staffordshire—Croxdon Abbey. Sussex—Battle Abbey Gateway. Yorkshire—Kirkham Abbey Gateway and Cloisters. Wales—Chepstow Castle. Scotland—Dryburgh, Kelso, or Melrose Abbey; Monastery at Iona, Elgin Cathedral. Ireland—Cashel Cathedral; Jerpoint Abbey. The drawings to consist of at least one plan, an elevation, and a section, drawn to the scale of $\frac{1}{4}$ of an inch to the foot, with details to a larger scale. The elevations to be in line only, and the plans and sections to be tinted in sepia only. Perspective drawings may be also sent, and may be either hatched in, or tinted in sepia, or in indian ink. The jointing of the masonry to be particularly marked, together with the mode of construction and material used. It is strongly recommended that the rough drawings be plotted on the spot, and sent up to the Institute with the fair drawings. These medals are open to all members of the profession, without limitation as to age.

Soane Medallion.—That the Soane Medallion be awarded for the best design, well illustrated by a sufficient number of drawings, for a Parochial Church, to contain 1,500 persons, and arranged for the Protestant worship, without any detached columns or piers, and so as to leave the sight and view clear and unobstructed throughout. The style may be either Italian or Mediaeval. The drawings to consist of plans, sections, and elevations, drawn to the scale of $\frac{1}{4}$ of an inch to the foot, together with a bird's-eye view of the whole arrangement and a block plan. Each of the two latter drawings to be to such a scale as a sheet of double elephant paper will admit. The plans and sections to be tinted in sepia only, and the elevations to be in line only. Perspective drawings may also be sent, and they may be tinted or hatched. The successful competitor, if he go abroad within three years after receiving the medallion, will be entitled to the sum of £50 at the end of one year's absence, on sending satisfactory evidence of his progress and his studies. The competition for the Soane Medallion is open to all members of the profession under the age of thirty years.

Prize offered by the President, Mr. Tite, M.P., F.R.S.—That a Prize of Ten Guineas be awarded to the author of the best set of architectural drawings, executed in the best manner, and in the Italian style of architecture, for public buildings adapted to modern wants, e.g., churches, town halls, railway stations, public offices, &c., in England. The drawings to be in colour and shaded, and they may be drawn either in perspective, or geometrically. If in perspective, they are to be of the size which a sheet of imperial paper will admit. If drawn geometrically, they must be to the scale of $\frac{1}{4}$ of an inch to the foot. A plan,

tinted in sepia, of the principal floor of the building, drawn to a scale of $\frac{1}{4}$ of an inch to the foot, is to accompany each set of sketches. The competition is open to all Associates and Students of the Institute. Each set is to consist of not less than two, and not more than three, drawings.

Sir Francis E. Scott's Prize.—That a Prize of Ten Guineas, offered annually by Sir Francis E. Scott, Bart., for the term of five years, be awarded to the author of the best set of drawings for a building of moderate dimensions, devoted to civic or domestic purposes, in accordance, throughout, with modern requirements, and designed in harmony with the style of architecture of the thirteenth or of the fourteenth century. The drawings may be either outlined, coloured, or tinted, and drawn either geometrically or in perspective. If in perspective, they are to be of the size of a sheet of imperial paper. If geometrically, to be to the scale of $\frac{1}{4}$ of an inch to the foot. In all cases to be accompanied with a plan, tinted in sepia, of the principal floor of the building, and details of some part of the furniture, fittings, stone-work, metal-work, &c., are to be sent in drawn to scale and finished in any manner chosen by the candidate. The competition is open to all students in architecture under the age of twenty-five years.

Students' Prize.—(For students of the Institute only.)—That the subject of the design for the Students' Prize in Books for the year 1862 be "A Drinking Fountain." The drawings to be executed to the scale of $\frac{1}{4}$ of an inch to the foot; the plans and sections to be tinted in sepia, and the elevation to be in outline, etched or tinted in sepia. Perspective drawings are not necessarily required, but may be sent, and be in outline etched, or tinted in sepia.

Students' Monthly Prizes.—(By students of the Institute only.)—The following subjects have been selected for the sketches for 1862, to be taken as nearly as possible in the order given, attention being requested to their being forwarded to the hon. secretaries at, or soon after, the end of each month. List of subjects:—A spandrel filled with foliage; ditto with open tracery; a niche with pedestal; ceiling; stone diaper; corbel; cross; mouldings (with sections); scroll-work in stone or plaster; scroll-work in iron or wood; capital, moulded, seen from below; ditto, foliated. The sketches to be made from actual buildings, or from casts, or other examples in relief. Any student may send a study or studies from the human figure in place of either or any of the above subjects, provided only that the said studies do not exceed in number one-half of his architectural sketches. All the sketches to be at least as large as a half-sheet of imperial will admit. They may be in outline only, or etched in, coloured, or tinted.

Directions for Competitors.—Each essay and set of drawings is to be distinguished only by a motto, without the name of the author attached; but it is to be accompanied by a letter, sealed with a blank seal, and having on the outside the same motto as that attached to the essay or drawings, and enclosing his name, with an address to which a communication may be sent. The packet directed, "To the Honorary Secretaries of the Royal Institute of British Architects," and marked *Essay for Medal* (or) *Drawings for Medal (Motto)*, is to be delivered at the rooms of the Institute on or before the 31st of December, 1862. Only the envelopes containing the names of the successful competitors will be opened. Should none of the essays, drawings, subjects, or buildings respectively, be deemed by the Institute of sufficient merit and importance to deserve the distinction of the premium offered in each case, they reserve to themselves the right of awarding such other premium in lieu thereof as they may deem fit, or of withholding it altogether; and if the best essay or drawings should be by a candidate who has been successful on a former occasion, they reserve the power of adjudging such other reward as they may think fit, and of awarding the medals to the second in merit. The essays, and the illustrations, to which the Institute medals are awarded, become the property of the Institute, to be published by them if thought fit. In case the essays are not published within six months after the award of the medals, the authors will be at liberty to publish them. The drawings for the Soane Medallion will be returned to all the candidates, on application; to the unsuccessful after the adjudication, and to the successful after the presentation of the medal.

PROPOSED REMOVAL OF THE SOANE MUSEUM TO SOUTH KENSINGTON.

ON a motion, in the House of Lords, by the Duke of Buckingham, that Sir John Soane's Museum Bill be read a second time, Lord Overstone observed that the Bill was one which required the attention of the House. Its object was to enable the trustees of the museum to send a portion of its contents to the International Exhibition, and for a time to denude itself of those treasures. A like request was made to the trustees of the National Gallery, but was refused by them. He, therefore, could not see why it should be limited to one museum in particular if the principle were at all one of which they could approve. At present the Soane Museum could be seen without payment, but he need not tell their lordships that that would not be the case when removed to the Exhibition. He should not offer any opposition to the Bill, but it required serious consideration.

Earl Granville said he could well understand why the National Gallery had refused to lend its pictures; but the same principle did not apply in both cases. Last year only 2,000 persons visited the Soane Museum; but the number who would this year visit the picture gallery at South Kensington might be expected to amount to a couple of millions. He trusted that their lordships would assent to the Bill.

The Bill was then read a second time.

Really, it is to be hoped that the threatened removal will not be carried into effect; there can be no reason whatever, as we have previously shown, why all that we have of moveable art in London should be destined, sooner or later, to find its way to South Kensington. We wonder if the larger number of persons who, undoubtedly, will visit the collection if it really is taken to the Exhibition building, will hereafter be given as a potent reason for the final removal of the Museum?

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post*. Gold watches, 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enable persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 & 34, Ludgate-hill, 46 & 47, Cornhill, London, E.C. Established 1749.

CHURCH, CHAPEL, AND SCHOOL BUILDING.

Rochester.—St. Nicholas' Church.—The alterations and enlargement of the interior of this church, which have been in hand nearly twelve months, are now almost completed, and according to present arrangements the church will be opened on the 10th April. The interior of the edifice has undergone a complete change, the whole of the pews having been cleared away, and a gallery erected round the church. In order to open on to the western window, the organ has been removed to one of the side galleries.

Suffolk.—Alterations and additions are to be carried out in Ousden church, and tenders have been called for. Mr. Clark, of Newmarket, is the architect. The tower of Foxcote Church, near Sudbury, is to be taken down, and a new tower and spire, with several other works, are to be immediately proceeded with.

Cambridge.—The north wall and roof to the nave of Kirtling Church are about to be restored, also under the superintendence of Mr. J. P. Clark.

Kildare (Ireland).—A new Roman Catholic church is about to be erected at Broadford, in the county Kildare. Mr. Butler, of Dublin, is, we understand, to be the architect.

Taunton.—The Tower of St. Mary's Church.—The *Taunton Courier* says: It is with no small sense of pride and gratification that we note the rapid approach to completion of our beautiful tower. The great beauty of the work, as a whole, comes out more and more as every stone added brings it nearer to perfection; and from the astonishing effect produced by the one pinnacle which is already erected upon the entire design, we begin to see how great will be the difference when the other three are in their places. We are given to understand that there is a pretty certain prospect that by the month of August next we may see the tower of Taunton Saint Mary Magdalen complete in restored beauty. We may be pardoned for feeling a little exultation at the refutation of all the despondent prophecies which were uttered when first the sad work of demolition of the former tower was commenced: "Ah," said our discouraging friends, "You will never get the money to put up those pinnacles again, and if you do, where are you to get the man who is competent to restore them?" But now the thing is done; we have the money, and it is but paying to Mr. Davis his due meed of praise and congratulation, when we say that the exquisite piece of work which crowns the new tower is a standing assertion that in him has been found the right man to put the pinnacles in their right place. With regard to the funds, we are happy to be able to state, upon reliable authority, that if the last instalments of these premises subscriptions are promptly paid up, the churchwardens will have sufficient funds to meet all claims upon them, including the re-hanging of the bells and replacing of the clock and chimers. The *Courier* then calls attention to a proposal which has been made by the vicar, that the inhabitants of the county should be invited to join in placing in the new tower a memorial window to the late Prince Consort. We, says the writer, also find that a subscription has been set on foot for placing in the niches in the first story of the tower a set of statues, of the eleven Apostles. There can be no doubt that when the tower was originally built, there were statues in these niches, and Mr. G. G. Scott, the architect, who has throughout superintended the work of restoration, has given his decided opinion that the tower would be perfectly finished if this suggestion were carried out but as the statues were gone at the time of the proposed restoration, and the cost of reproducing them was not included in the estimate for the work, there are no funds available for the purpose.

Startforth Church.—A faculty has been obtained for the demolition of the church of the Holy Trinity, at Startforth. There was little in the old building worthy of preservation, and of that little all was in too dilapidated and perishable a condition to bear removal. It consisted of chancel, 30 feet by 12 feet, nave, 26 feet by 18 feet, with double bell-cot at the west end and south porch. The south entrance was the oldest portion, being of Norman character, having plain circular arch and cushioned caps, all thickly coated with whitewash. The west end was lighted with two single lights, and divided by a buttress in the centre, a mode of treatment of rare occurrence. The interior was rich in the possession of some of the most uncomfortable seats in existence, with bad accommodation for sixty or seventy persons. The pulpit nearly reached the height of the ceiling, with reading desk and clerk's desk to match. A font, of local marble, will be preserved, and elevated on a step in the new building. The new church is to be of much larger dimensions than the old one, and extend northwards and westwards over the present site. The chancel is to be 25 feet by 20 feet, nave 54 feet by 24 feet, and south porch 8 feet by 8 feet. The tower is 14 feet square and 90 feet high, with massive angle buttresses, and angle stair-turret to west gallery and heltry. Buttresses divide the nave into three bays, lighted by double lancets. Two lancets light the chancel on the south side, and a traceried window of three lights fills up the east gable. The roofs are high pitched, covered with green Westmoreland slates, and open in the interior to the ridge, having the main principals constructed of laminated arches, and the intermediate ones with cross-braces. The chancel roof is to be boarded on moulded ribs, and all the woodwork exposed to view will be stained and varnished. The exterior is to be built of snecked and squared rubble, from the Spital quarries, and the dressings to be of dressed stone. Messrs. R. and T. Borrowdale have contracted to do the work for the sum of £1,275, and to have the church ready for service by the 1st of December.

Durham.—St. Paul's Temporary Church, at Darlington.—The foundation stone of this structure was laid a few days since. The building will be 61 feet long by 33 feet wide, with a small chancel and vestry at the south end.

Kent.—The tower of Ilaves Church has recently been restored, from the plans of Mr. Scott, under whose direction the nave and chancel were restored, and a new north aisle added four years ago. The original dressings of fire-stone having decayed, the windows had been filled up, the stringcourses cut back to the wall, and the tower, inside and out, covered, with a coat of plaster, completely concealing its original features. This has all been stripped off, the windows, nine in number, have been re-opened, the decayed fire-stone dressings, quoins, and stringcourses being replaced with Bath stone, and the flint work well pointed. The old spire oak shingled about 15 feet high, built of the timber of the original spire, which was blown down in 1703, has been replaced by a new one, 30 feet high, the clock faces being placed in dormers in its base.

Exeter.—The Exeter Diocesan Board of Education have intimated their intention to erect a chapel adjoining their training college, under the superintendence of Mr. Hayward.

Oxfordshire.—New Wesleyan Chapel at Pillerton Priors.—A few days ago this chapel was opened for service. The edifice is stated to be "chaste in style—in fact, quite a model, both as to internal fittings and external appearance."

Clifton.—New Wesleyan Chapel.—A chapel is about to be erected in this suburb of Bristol, at a cost of over £6,000.

Lozells New Congregational Chapel.—The foundation-stone of the New Congregational Chapel at the Lozells was laid a few days since. The building will be in the Italian style, the dimensions being 80 feet long and 53 feet wide, and each end being circular. Entrance will be obtained by a portico in the main front, on either side of which will be the gallery stairs. There will be two galleries, one 10 feet and the other 22 feet above the chapel floor, both of which will be carried about three-fourths round the building. The fronts to the galleries will consist for about half their height of moulded boarding, the upper half being of open cast-iron work. The upper gallery will be supported by iron brackets. The ceiling is to be divided into panels, the centre ones of glass. In addition to the roof lights there will be a tier of windows over the upper gallery, and another tier below the lower gallery; and over the pulpit will be nine stained glass windows. The chapel is to accommodate 1,100 persons, and the cost of the building is estimated at about £3,000. The architects are Messrs. Poulton and Woodman, Reading; the local and superintending architect is Mr. F. D. Johnson, Bennett's-hill; and the builder, Mr. William Bennett, Lozells.

Abingdon.—The foundation-stone of a new Independent chapel was laid here a few days since. The total cost of the building will be about £2,000. The architect is Mr. J. S. Dodd, and the builders are Messrs. Winterborne and Bowles.

CAMBRIDGE ARCHITECTURAL SOCIETY.

THE third meeting of the Society for this term was held in the Philosophical Society's rooms, on Thursday evening last. The Rev. the PRESIDENT in the chair. The Society had invited any persons interested in the subject to hear Dr. Pierotti, architect to the Pasha of Jerusalem, on "The History of the Temple Enclosure."

The PRESIDENT having introduced him to the meeting, he spoke for a short time in French, and said that he had obtained the assistance of the Rev. G. Williams, of King's College, who had kindly undertaken to read a translation of his paper.

Mr. WILLIAMS then read the paper, which was illustrated by a plan of Jerusalem, some sections, and several photographs. The paper entered into all the discoveries of Dr. Pierotti about the enclosure, and explained the position of the ancient cisterns, drains, &c., connected with the Temple.

At the conclusion of the paper, Mr. WILLIAMS made a few remarks, showing how the schemes for the plan of ancient Jerusalem were affected by Dr. Pierotti's discoveries.

Reviews.

What is Good Iron, and how is it to be got? Murray, Albemarle-street, 1862.

UNDER the title of "What is Good Iron, and how is it to be got?" the anonymous writer of the pamphlet before us addresses himself to the consideration of a very important question. There can be no doubt as to the worthless character of a very large proportion of the iron used in engineering and mechanical works. The fact is too well known to be denied even by those interested in the production of a treacherous material on which daily depend the lives of thousands of human beings in every quarter of the globe. Cheapness is, no doubt, the root of the evil, and we can scarcely hope but that a cheap and bad article will for a long time compete successfully with a more costly but trustworthy material; and to such an extent has this obtained that, as the writer remarks—

The newspapers tell us of works retarded at the dockyards because the Admiralty cannot get the iron they require, and of angle bars rejected and returned on the hands of respectable firms, who cannot have wanted the will to satisfy their critical customers. Great railway companies have begun to make their own rails, because they despair of obtaining in any other way the requisite quality. And all this at a time when, for four years, the price of iron, good as well as bad, has been falling—or, in other words, the supply has constantly exceeded the demand! How comes it that the prodigious development of the iron trade has led to a state of confusion in which, as it would seem, good iron can neither be bought nor sold? It is the object of these pages to offer an explanation of this paradox.

From the very first the progress of the iron manufacture has shown itself only in the increased facility and diminished cost of production. In the quality of the produce there has been no improvement since, in days anterior to history, a small quantity of iron was extracted from the best ores, which alone were then available, by the rudest and most laborious process.

The great discovery of smelting iron by means of pit-coal effected a change in the manufacture which has assented to England the command of the markets of the world, but has lowered the quality of the iron. There are purposes which iron thus smelted will not serve, and accordingly a small quantity of iron smelted, as of old, with charcoal, is still made in this country, and further supplies are imported from Sweden.

In our own days the introduction of the "hot blast" has brought about a second revolution in the manufacture hardly less important than the first in its results, but unfortunately qualified with a larger alloy of evil. Between thirty and forty years ago, it was discovered that, by heating to a very high temperature the "blast" which maintains the combustion of the smelting furnace, a great saving in the quantity of the fuel might be effected. This led to the further discovery that not only might the coal be used in its raw state, by which the expense and the loss of coking were saved, but that coal which had hitherto been rejected for its noxious qualities might now be sent to the furnace; and subsequently, by the same means, even the intractable anthracite was pressed into the ironmaster's service. Hitherto only the superior argillaceous ores of the midland districts could be profitably converted into iron; but by the application of the hot blast the metal was extracted from every substance that contained it. The "black band," which had resisted all attempts to make it productive, became a mine of wealth to its possessors; and as the minerals of the Cleveland, Northamptonshire, and other districts were successively discovered, they were converted into cheap and serviceable, although inferior, iron. It was also found (and of all the benefits of the hot blast this is the most questionable) that the cinder or refuse of the puddling forge, hitherto of no value, would, when added to the materials of the hot-blast furnace, yield a larger percentage of iron, though of very inferior quality, and thus increase the bulk, though it damaged the character of the produce. The pig-iron thus made is always designated in the trade as "cinder-iron."

On the quality of pig iron, as the raw material of all the subsequent operations of the manufacture, the quality of all that is made from it depends:—

The annually increasing quantity of cheap pig-iron thus thrown into the market compelled the ironmasters who possessed the best minerals and the best fuel to reduce by every expedient their own cost of production; and gradually the pressure of competition

induced them to employ the hot-blast to a considerable extent. In many instances the exhaustion of the best materials has made this necessary. Where they have done this without unduly lowering the quality of the materials, the "hot-blast iron" so produced bears a very high character; but, unfortunately, many of them have availed themselves of the hot-blast to bring into use any materials which would enable them to compete in price with the makers of the cheapest iron, and thus the name of the district has ceased to be of itself a sufficient guarantee for the quality of its produce.

The application of this new agency to so many new materials had the effect of sending into the market, not only an increased quantity of iron, but a variety of quality such as hitherto had been unknown. At the head of the list stands the grey cold-blast iron. By untoward accident, or by want of care or skill, the produce of the cold-blast furnace may turn out mottled or white, and is then of inferior value. But the grey cold-blast iron by its name gives a guarantee for the quality of its materials, and is therefore divided by a strong line of demarcation from all "hot-blast" whatever; nevertheless, the difference between the cold-blast and the best "hot-blast" made from the clay iron-stones without any admixture of cinder is small in comparison with that which separates the best hot-blast from the worst. It might fill a volume to describe the various properties and uses of the various kinds of iron. It is sufficient to note that only two kinds, the cold-blast and the best hot-blast, will bear repeated "working" without losing their fibrous texture.

The author then points out how the first introduction of cheap iron for common purposes has resulted in its use in cases where superior metal only should be employed, and that in many cases the use of inferior metal is not attended with economical results:—

When rails were first manufactured for the newly-projected lines, they were made of a quality which might in some degree be expected to bear the friction and the momentum of the prodigious masses which were to be whirled over them. But the cost of such rails was considerable; their merit was not discernible by the eye. Directors were ignorant, engineers inexperienced. The present was all-important, and competition was hot. Inferior iron, and, worst of all, cinder-iron (the nature of which has been already explained) was employed almost of necessity, and all but universally. The consequence is, that the greater part of the lines need relaying years before such an expenditure ought to be required. Nor does the mischief stop here. What is to become of the prodigious mass of old rails? If the railway boards work them up again (and the temptation to do so is all but irresistible), they only repeat the error; or if a portion of these rails is sold as "scrap-iron," who is sanguine enough to hope that it will be purchased only for those purposes to which inferior iron can fitly be applied? There is no escaping from the consequences of the first fault, and these cinder-rails will long be banded about to burden the market and infect the manufacture of the country.

When iron merchant vessels first came into use their plates were made of the tough fibrous iron used for ordinary boiler-plates, and the result corresponded with the prudence of the design. The *Great Britain* stranded in Dandrum Bay, withstood for months the beating of a surf such as no floating work of man's hands had ever stood before, or ever will stand again, till shipbuilders change their present shortsighted policy. The success of the first iron boats was complete. Their cost was amply repaid by their durability and the cheapness of their repairs. "But could they not be made for less?" asked the Spirit of Gain. "No doubt they could," answered Competition. Other plates of inferior construction, to which the distinguishing name of "boat-plate" was given, were forthwith manufactured. A "boat-plate" may be had for from 20s. to 30s. per ton less than a "boiler-plate." The saving thus effected in so large an expenditure is trifling; the difference in security and durability is very great. Six Baltic steamers belonging to the port of Hull have been lost in scarcely more than a twelvemonth. How many more of these cheap iron vessels have left our shores and have never since been heard of? The increased rate of insurance on cheaply-built iron boats will give some measure of the additional risk occasioned by this ill-judged parsimony, and may, perhaps, weigh with those, if any such there be, to whom higher motives appeal in vain.

Through all these fluctuations, as might be anticipated, there is to be traced a steady decline in price.

In 1806, according to tables lately published at Liverpool, "merchant bars" (finished iron) made from cold-blast pig-iron (for none other was then known) were quoted at £17 10s. per ton. In 1861 the best make of Staffordshire had sunk to £7 10s., and Welsh bars might have been bought for even less than £5 15s. It is true the present is a time of unusual depression, but if we take the average price which finished iron must maintain, if it is to remain a staple manufacture of the country (about £8 per ton), even thus the reduction is prodigious; and if cheapness were the only measure of progress, the advance would be great indeed.

With regard to the manufacture, printed returns give us the following facts:—

In the year 1840 the total make of Great Britain is stated at what was then thought the marvellous amount of 1,396,000 tons. In 1860 it had risen to 4,156,000 tons, and to such an extent has the productive power of the country increased that to this prodigious total another million might on any sudden demand be added without any additional expenditure on buildings and machinery, or "plant," as such previous preparations are technically termed. It must also be noted that great skill has been acquired in the art of correcting the defects of the inferior kinds of iron by judicious mixtures, and thus giving them the highest quality of which they are susceptible. But these brilliant results are qualified by a fearful drawback. In the year 1840, the cold-blast iron amounted to 771,000 tons, or considerably more than half of the whole make. In 1860, it is a significant fact that the distinction between hot and cold blast is no longer noted in the returns; but of the aggregate make of 4,156,000 tons it is not possible to estimate the portion of cold-blast at more than the odd 156,000 tons. Those best acquainted with the trade agree that in the year 1860 there could scarcely have been more than thirty furnaces blown with cold-blast, and that the annual production of each of these cannot be rated at so high an average as 5,000 tons. Perfect accuracy cannot be attained, as perpetual changes are taking place in the ironmasters' arrangements, and little is known of the production of those pig-iron manufacturers who consume at their own forges the produce of their furnaces. But this calculation is sufficiently near the truth to justify the assertion that, while in twenty years the total make of the country has been trebled, the cold-blast has dwindled down to one-fifth of its former amount; and whereas in 1840 it constituted considerably more than one-half of the aggregate produce of the iron manufacture, in 1860 it has sunk down to about one-twentieth! Assuredly, if there was not a great redundancy of cold-blast pig-iron in the year 1840, there must have been a great deficiency of it in the year 1860!

As to the use of scrap-iron, the author says—

If scrap-iron is employed to any extent, it is hard to say what precautions would suffice to prevent the use of the improper kinds. The supply of best scrap-iron is altogether insufficient to meet a large demand. Old rails—which are almost universally made of cinder-iron—may be had at 20s. less than the best scrap-iron, and 40s. or 45s. less than puddled bars. Cinder-iron is an element of weakness wherever it is introduced. It is not turned into good iron by being broken small, and it is only made worse by further working.

The questions what is good iron, and how is it to be got, are of some moment at the present time, and the writer of the pages from which, looking to the importance of the subject, we have largely drawn, if he has not solved them, has, at least, gone a good way towards divesting the question of some of the obscurity through which it has hitherto been viewed by the public.

WE have also received Mitchell's *Screw Piles and Moorings*; Chambers' *Social Science Tract on Building Societies*. Of Becton's publications—*Home Pets*; the *Boy's Own Magazine*; the *Englishwoman's Domestic Magazine*; the *Boy's Own Library*; the *Illustrated Family Bible*; the excellent and complete *Book of Garden Management*; and the *Dictionary of Science, Art, and Literature*, which deserves more than a passing notice at our

hands. *The Coming Struggle among Commercial Travellers Relative to Usages and Club Houses*. A good idea forcibly insisted on by Mr. Kibbler Webb *On Iron Breakwaters and Piers*. *The Electrician*; a well-conducted Journal, devoted to the interests of a still progressing science. *The Dublin Builder*; *Practical Mechanics Journal*; *Beamish's Life of Sir I. K. Brunel*; and the *Life of Sir S. Benthall*, by Mrs. BENTHAM. To some of these we must return.

Correspondence.

THE ROYAL ENGINEERS.

SIR,—Having disposed of that part of the "Colburn's" scheme which relates to officers, I will now endeavour to say something about the non-commissioned officers and men.

I have often wondered whether contempt or pity has been more generally felt by the profession for those who, in their struggles for fictitious fame and notoriety, have been compelled to hold up to ridicule the rank and file of their own corps, by saying of them what cannot be substantiated, and that bears on its face the impress of farfetchedness and subtlety. *The Times* and *Daily Telegraph* especially are well primed with puffs and statements, as worthy of credence as the loquacious hyperbole and verbose selling speeches of a Cheap Jack at a country fair, and that are given out with the same end in view, viz., to mislead the ignorant and careless. I will only mention two such puffs: "This corps is composed exclusively of architects, surveyors, and mechanics," and "A few architects and surveyors will be taken."

I happen to know something about the corps, and I say that there is not a single architect in it—whether officer, or in the rank and file; a few land surveyors there are in the survey companies, who have served their pupillage, such as it is, on the Ordnance survey, at the public expense; and as to mechanics or tradesmen, I would ask what proportion they bear to the miners or tradesmen in name only, or of no trade at all? Every civil officer in the department that I have been enabled to consult—and they are not a few, and are the persons who can give an opinion, for "Engineer officers know nothing of work or workmen, how should they?"—has stated that the proportion of tradesmen of the building trades does not average 10 per cent., and that even these are generally very inferior tradesmen. This is but natural; why should good workmen enlist for soldiers? Patriotism is all very well in its way, but it will not tempt good tradesmen to barter away freedom from restraint in exchange for a soldier's jacket; this is the rule, to which there are exceptions as a matter of course; but, as a rule, the tradesmen in the corps of Royal Engineers are such in name only—runaway apprentices, idlers, &c.; the exceptions being in the case of those who have felt it best for their interests to be *non est* for a time till something or other has blown over, or those who enlist through drink, and remain soldiers on the same account. It would be very strange, indeed, if out of upwards of 4,000 men we did not find a tradesman or two. There are some very smart sergeants and corporals in the corps, but to find a good tradesman of a building trade (and it is with that class or description of trade that we have to do), either one or the other, is an exceptional occurrence. I remarked this to many engineer officers, and have invariably received as a reply—"That good tradesmen make the worst soldiers, and rarely become non-commissioned officers, but generally defaulters."

If the article in *Colburn's* means anything, it means that all men in the corps are building tradesmen—that there are no tailors, shoemakers, labourers, collar makers, &c., &c. I suppose the writer of it, with his small stock of information on anything connected with work or workmen, considered that a sapper should be understood, in the common vernacular, to be a man who can build a house; that the tradesmen (sappers) took turn and turn about in attending on each other, carrying bricks or mortar, or excavating foundations on one day, and making doors, slating a roof, or painting or paper-hanging the next. Oh, blissful ignorance! "Ex nihilo nihil fit."

Our friend goes into many items, and proves that a sapper costs £76 10s. 5d. per annum, or 4s. 10d. daily; he has, however, forgotten (?) to include any house rent, or a proportion of the cost of making him a soldier; his allowance for tools is also about one-fourth of what it should be. It also strikes me as rather strange, that whilst all soldiers are supposed to undergo a fixed period of rifle drill annually (I believe a month is the time), the Royal Engineers have none, except what they can learn in half a day per week, or twenty-six days per year; this, probably accounts for the omission in the cost of a sapper of an item for rifle instruction.

I have not the time, nor have I the inclination, to check in detail what is given us; I will therefore take as correct each of the various items, to which must be added 5 per cent. on 150, which would be about the average at home and abroad, for providing a sapper with quarters and all the necessary adjuncts, such as canteens, churches, hospitals, wash-houses, lavatories, ball-courts, &c., &c.—to say nothing about keeping them in repair when built—or £7 10s. per annum for house rent. Then, omitting altogether the interest on the amount, there is £100 always considered as the expense of making a man a soldier, which, considering that most soldiers enlist for ten years only, is £10 per annum. Then 30s. must be added to the item for tools, which is little enough, considering the waste and destruction of them. These amounts, added to £76 10s. 5d., give, in round numbers, £95 per annum as the average cost of a sapper, tradesman or labourer, good or bad, and exclusive of cost of officers, and of their accommodation, or a daily rate of 6s. 10d.

I believe that Weale's Price Book is arranged to give a builder 20 per cent. profit on day labour, on account of the losses incidental to day-work, and that the prices there quoted for labour are one-fifth above London prices as paid to workmen. There are very few sappers employed in London, except those that were sent to the Exhibition "to upspack goods," the impropriety of which is very glaring, because 3s. per day will procure the sort of men required; additional employment would also be afforded to some labourers, and also to a few extra policemen.

In making a comparison of civil labour, we must first consider the stations where sappers are kept, and what are the rates there for civil labour; also take an equal number of civil tradesmen to compare with those in the corps.

I find that the average rate paid to mechanics is 4s. 6d., and labourers 2s. 6d.; excluding London and some of the principal towns, where sappers are seldom seen, and, for argument's sake, I will assume that 20 per cent. of the corps are tradesmen of building trades, and good tradesmen, and only 80 per cent. who are tradesmen in name only, or who call themselves labourers:—

100 sappers, whether tradesmen or labourers, at £95 per annum	£9,500 0 0
20 civilian tradesmen, at £75 10s 6 per annum	£1,408 10 0
80 labourers	3,130 0 0
	4,538 0 0

Saving by employing civilians

But, "to soar in the regions of fancy," I will assume every sapper to be a good tradesman—

100 will cost	£9,500 0 0
100 civil tradesmen	7,042 10 0

Even by this assumption the civil labour is cheapest by

I have said nothing about waste of materials, which is not an inconsiderable item in military labour.

The article in *Colburn's* proposes to add 5,849 rank and file to the corps of Royal Engineers, which gives us the rule-of-three sum—If 100 cause a loss of £4,962, what will be the loss on 5,849? Answer, £290,227 7s. 7d.; having obtained which amount, I am led to ask, what has been the annual loss on the present numbers, and what it would be if the scheme were carried out. I therefore fall back on the rule of three—As 100 : 4,962 :: 4,351 : £290,227 12s. 4d., as the present annual loss; and if the proposed addition were made to the present strength, the total annual loss would be £496,200.

To put against this I may be told that sappers are soldiers, and that this amount is not altogether lost. Admitted. But what does an infantry soldier cost? Not so much as a

sapper by "cost of engineer establishment at Chatham." The amount of "working pay," the cost for "tools," a proportion of "regimental pay," and many other items, or generally as about two to three. Then, if sappers become efficient soldiers in twenty-six days per annum (less than the period required for rifle instruction, &c., in the line), is there any necessity for a standing army? If twenty-six days per annum, at "half a day per week" will make a soldier, or, rather, keep him as such, about a fortnight of continuous drill would make any number of them; but, if we take sappers to be no more efficient than line soldiers, why are we to keep 10,000 sappers when we might for their cost keep 15,000 line soldiers, and still be money in pocket? The case, therefore, stands thus: sappers cost more than civilians as workmen, without a tithe of their efficiency; and they cost more than soldiers, with the same drawback, so that, whether as workmen or soldiers, they are dear bargains. (I may here mention that I have made no allowance for what it would cost to educate the sappers as proposed, the cost of workshops, &c., &c., or the extra pay that would have to be given, supposing the class of men were obtained.)

If I am told that sappers are invaluable in the field on account of their knowledge of sapping, mining, throwing up entrenched earthworks, and so on, I ask how do they acquire this knowledge? Is it learnt in the "half day per week?" If so, line soldiers can all be made equally competent, without distressing themselves or neglecting any portion of the other military duties, and the corps of sappers can be dispensed with.

With such proofs, I can safely ask if the whole system is not a deception from top to bottom, kept up for purposes other than the interests of the country? I am firmly convinced and fortified in that conviction by the opinions of many eminent military officers, that as the competency of the majority of line officers in military engineering is equal, if not superior, to that possessed by engineer officers—if there were a few sergeant instructors attached to each regiment, say one per company, for instructing the troops in sapping, mining, &c., on the same principle as musketry instructors, more satisfactory results would be obtained than is derived from the present expensive, deceptive, and antiquated system.

I have lately seen frequent mention made of a model of the Preston Barracks, which is being prepared at Chatham by sappers, for the Exhibition, under the direction of Lieutenant-Colonel Collinson, R.E. (it is excusable that so many notices of this model should be published, considering that it is made for notoriety, as something that the corps has done). I wonder how many companies have been picked to find men fit for the work; why the Secretary of State sanctions such expenditure as will have incurred in its preparation? What the real expense will be? Not a *make-up* account, but a real bill of costs, everything included. I should also like to know if justice will be done to the Clerk of Works, who designed these barracks and who superintended their erection, by having his name mentioned in connection with the model? Let us have no deception in this affair or it will be exposed. But to return from this digression, I trust that I have made out a clear case why the scheme as proposed by an "officer of high rank in the corps" in *Coburn's United Service Magazine* of January last should not be introduced. I have proved that engineer officers would cost about £1,000 each to bring them to the proposed standard, and that then they would be but little better than they now are, whereas competent men could be obtained without "educating and maintaining them at enormous expense to the public." I have also proved that sappers cost more than double what civilian workmen in equal numbers would cost, and without their efficiency. I have also proved that sappers are more expensive than line soldiers in the proportion of three to two, and I leave your readers to draw their own conclusions therefrom.

I might, if so disposed, go through that article from beginning to end, and hold it and its writer up to public ridicule, and fight him with his own weapons, one of which would be his main-spring *day-work*, which by every practical man is admitted to be the most unprofitable of all systems, and never to be resorted to if it can be avoided. But I refrain, and leave him to his own reflections, merely giving him a little parting advice, *ne sutor ultra crepidam*, so that whenever he again ventures on proposing any scheme to the public, he should select a subject with which he may have some acquaintance, and display it, and not occupy so much space with a proposition so ridiculous and absurd as that of executing the works and buildings required by the War Department by engineer officers and sappers, without clerks of works or other civil professional gentlemen—by a system of day work, or a "self-supporting scheme," which proposition, literally interpreted, means asking the country for a further trial in deception still more deceptive, to break down more completely than has the present system, because on a more gigantic scale, and without the counterbalancing influence of the life of the department—the civil professional officers.

In conclusion, I have only to express my acknowledgments of your kindness in publishing my views on a mad scheme, which I hope have imparted some little information to yourself and the numerous readers of the BUILDING NEWS.

PETARD.

17th March, 1862.

THE ALBERT OBELISK.

SIR,—The BUILDING NEWS has generally shown itself willing to admit a defence of opinions contrary to those which it itself has advocated. I beg, therefore, for permission to advance, as briefly as I can, one or two reasons why it seems to me that, notwithstanding what is urged in your Number for the 21st March, the Albert monument, if an obelisk, must be monolithic.

To possess true monumental character any object must show two characteristics; first, it must be as enduring as possible; secondly, it must show a desire to honour, in the best possible way, the memory of the person commemorated, or, in other words, must show marks of sacrifice.

I need not waste words by attempting to prove the first part of my proposition. "Monumental" is more frequently used to express the enduring and unmovable nature of a structure than to express that it is commemorative. Nor is it necessary, I think, to occupy your space by an attempt to prove that an obelisk built of masonry will really be somewhat less durable than a monolith, and will apparently be infinitely less so.

I think the second characteristic will be granted after a little thought as to be also one properly belonging to a monument. I believe in direct proportion to the evidence of sacrifice on the part of those raising the monument is the monumental character obtained. I say sacrifice, and not ostentation; and this distinction it is which makes the use of the most precious or most noble material and structure obtainable with the means in hand not only appropriate but indispensable for a monument.

Now, unquestionably, the most noble characteristic of an obelisk is its monolithic character, and this nobility can no more be approached by a built obelisk than the value of a priceless gem can be conferred upon a paste copy. The difference between the two is the same in its nature as that between a plastic cast and a marble statue, between Portland stone and Portland cement, between broad cloth and shoddy; you have the same form, but not the same value.

Now, if it really turns out upon counting the cost that we cannot raise enough to pay for quarrying and transporting a monolith of one hundred feet, let us have one of fifty, or twenty, or of as many feet as we can pay for. Let us not, however, prefer ostentation to sacrifice, and instead of erecting the largest perfect obelisk which our means permit, construct a full size model of the obelisk we should have liked to put up, but couldn't, and then call that honouring the memory of the Prince.

T. ROGER SMITH.

A NEW PUBLIC PLAYGROUND FOR LIVERPOOL.—A new playground for the public, given by the Earl of Sefton, and fitted with a gymnasium, has been opened at Liverpool. The inaugural proceedings in connection with the ground excited a good deal of interest; the Mayor, Mr. R. Hutchison, presided; and most of the leading and influential gentlemen of the district attended. Mr. Melly, in the course of an address, said, "All playgrounds are only experiments for the time being, and on the experiment now being made in Liverpool depends the success of the playgrounds all over England."

IMPROVEMENTS IN BUILDING, &c.

SMOKE-CONSUMING APPARATUS.—Dated August 9, 1861.—L. Vassiere.

The position of this apparatus is on the furnace under the boiler (where furnaces and boilers are used) and forward of the furnace bars. The smoke should be made to pass this apparatus at its lower part, it then ascends into small round holes made quite through the thickness of the inferior plate; from thence the smoke passes through a nipple, round which circulates heated air, which, meeting at the summit of the nipple, the smoke mixes therewith, and furnishes the latter with the oxygen required to establish combustion. This mixture traverses an upper plate (which is placed on the hollow nipple to receive its tube); this is also provided with a round hole; between this upper plate and the nipple a space of about the eighth of an inch is left to let the heated air pass to supply the required oxygen and establish combustion of the smoke, which operation takes place immediately above the space mentioned and in the hole of the upper plate, which is sufficiently heated to insure the inflammation of the mixture.

IMPROVEMENTS IN STOVES.—J. Billing.

The patentee claims,—1. The construction of stoves wherein the smoke from the fire-box is caused to pass horizontally through an opening in the back of the stove into a central back flue, in which it descends, and then passes into two side flues, whence it ascends into the chimney as described. 2. The construction of stoves having ascending and descending back flues, or simply one ascending back flue and a sliding valve to regulate the opening into the same, in combination with a throat valve, or throat valves, and wherein the opening and closing of the throat valve, or valves, and of the sliding valve regulating the opening into the back flue, or flues, is effected by means of one and the same screw spindle and levers, as described. 3. The application of a rising and falling blower to stoves actuated by an escutcheon, or a rose, in conjunction with the knob that regulates the opening and closing of the valve, or valves, as described. 4. The construction of stoves wherein a second moveable grating is placed beneath, and is fitted in between the bars of the ordinary grating, for regulating the draught and clearing the bottom of the fire as described. 5. The construction of stoves provided with a back draught wherein a fire-brick or metal back is employed, having a number of vertical, or nearly vertical channels, through which air is made to pass, as described.

VENTILATING APPARATUS.—W. Wilds.

This apparatus consists of a box, or case, the bottom of which is formed of woven wire, or perforated metal, and at top are fitted flaps, or lids, by which it is opened and closed, and which are connected by cords, chains, or like agents, passing over pulleys to a suspended balance weight. The patentee prefers, when he uses two flaps, or lids, to hinge, or joint them to a rail, bar, or stile fixed across the box, and to support the pulleys over which pass the chain, or cords which are fastened to the flaps in standards fixed upon the rail, bar, or stile, and to connect these chains, or cords to a chain or cord, by which the balance weight is suspended. The apparatus is fixed at the ceiling, or the roof of the room, or place to be ventilated, in such manner that air may pass through it when open, or from, such room, or place, communication being provided between it and the atmosphere, which may be conveniently done, when the ventilator opens under another floor, by providing a grating, air-brick, or opening at one or both ends of the air trunk formed between the joists. By the balance weights the flaps or lids may be completely closed, or may be opened more or less to admit and regulate the passage of air through the bottom of the box to or from the room or place to be ventilated.

CONSTRUCTION OF BUILDINGS SO AS TO UTILISE THE WASTE HEAT PASSING UP THE CHIMNEYS.—W. Clark.

This invention relates to an improved arrangement of the flues of the several fireplaces of a house or other building which are all made to unite in a chamber placed under the roof, and furnished with an opening for the escape of the smoke. This chamber is made incombustible, that is, the materials of which it is composed consist of bricks or stones for the sides, and iron for the bottom; a door is placed for affording access to this chamber, which is also of iron; the aperture for the escape of the smoke may be varied in size, according to the number of flues opening into the chamber. This aperture may also be furnished with a smoke distributor. Water cisterns may be placed in this chamber with a float open to the exterior serving for various domestic purposes, such as baths, water-heating apparatus, or other uses. Air reservoirs may also be employed with this smoke chamber, the air of which, being heated therein, is conducted thence for the purpose of heating apartments.

MACHINERY FOR CUTTING, SAWING, AND SLICING, OR PLANING WOOD AND OTHER SUBSTANCES.—P. Walters.

Here, on a strong framework of wood or iron, fixed or mounted on standards, a bed-plate is arranged, on which a slide, having suitable grooves to correspond with the bed-plate, is caused to move with a reciprocating motion by a connecting rod attached to the crank of a driving axle. The wood or other material to be operated upon is attached to the upper surface of the slide, above which a suitable plane, saw, or other cutting or slicing apparatus is secured by standards, bolted to the framework. By these arrangements, at each revolution of the crank a slice of wood or other substance is taken off of the desired thickness, and the cutter may be so regulated as to shave or slice the wood of such thickness that it will curl or roll up, and form spills, or a thicker slice may be obtained for many purposes.

CONSERVATORIES, ORCHARD HOUSES, AND OTHER HORTICULTURAL ERECTIONS.—J. Cranston.

This invention applies to horticultural buildings to be constructed of wood and glass, and also to erections for any other purposes in which the same principle of construction is carried out, but with the use of iron, zinc, copper, tin, lead, or other suitable material. In the place of glass, all the buildings being planned and screwed together, and made to rest upon blocks of wood or butts of trees sunk in the ground, so that they can be erected with great ease, and are portable. For horticultural buildings the space to be covered is to be divided crossways by principals formed to the shape required, and of any ordinary kind. Upon the backs or outer surfaces of the principals pieces of timber are fixed edgewise to run horizontally from end to end of the buildings, and at any distances apart that may suit the lengths of the glass to be used in the roof. These timbers have been called "radial pieces," and to them grooved rafters are secured, the top end of each rafter to the bottom edge of the "radial piece" and the other end of each rafter to the top edge of the radial piece, and so on throughout the roof, dividing it into planes, the one plane rising above the other as much as the radial pieces are deep. Sheets of glass are fitted into the rafters, sliding into the grooves, where they are held by turn buttons screwed to the ends of the rafters, the turn buttons being long enough, when in horizontal positions, to catch and bear up the glass on each side of the rafters, and when turned to vertical positions they are sufficiently narrow in width to allow of the panes of glass being pulled out. The radial pieces have circles, trefoils, quatrefoils, or small openings of any shape pierced through them at equal or unequal distances, either all along or partly along their lengths, for the ventilation of the buildings, the insides of the radial pieces so pierced having valvular slides with friction rollers at the edges made to run in grooves, so that the ingress and egress of air is always under control, insuring perfect ventilation by numberless small openings in horizontal rows throughout the whole roof surface. The outlines of buildings so constructed can be varied to any extent by making the principals upon which the radial pieces rest either straight, canted, arched, or curved.

APPARATUS FOR DRILLING AND TAPING GAS AND WATER MAINS AND PIPES, AND IN PREVENTING LEAKAGE THEREFROM.—J. Somerville.

According to this invention the patentee proposes to employ a peculiar apparatus, consisting of a bow or breech pipe or bracket, secured to the main or pipe to be drilled by clips or straps, and having fitted to it at its centre, or in any other convenient position, a set screw, for the purpose of applying pressure to a combined drill and tap of a peculiar construction, which is actuated by an ordinary ratchet or other suitable contrivance. Immediately above, and attached to, or forming part of, the drill or boring bit, there is a cylindrical piece of metal, of the same diameter as the hole made by the drill, its object

being to keep the drill steady after it has entered the main, and prevent it from breaking through too soon, or until the whole is ready to receive the tap; it also serves to plug the hole whilst the drill is breaking through, and so prevents the escape of gas or water at that time. The tap is formed on the upper part of the stem of the drill, immediately above the cylindrical part hereinbefore referred to, and has two or more annular grooves or recesses made round it at proper intervals, into each of which is fitted a circular washer or collar of indiarubber, leather, or other suitable material. These washers or collars should be made of slightly larger diameter than the hole to be tapped, so that, as the tap penetrates into the main, and the washers or collars successively enter the hole, they will effectually plug the same, and prevent any escape of gas or water through the longitudinal grooves or slots made in the tap. The intervals or spaces between the washers or collars should not be less than the thickness of the metal being tapped, so that there may be always at least one of such washers or collars in the hole. When the screw thread is sufficiently cut the tap is removed, and the service pipe is inserted in the usual manner.

DECISIONS IN THE COURTS.

IMPLIED COVENANT IN AGREEMENT FOR LEASE AS TO GOOD TENANTABLE REPAIR.

Tildesley v. Clarkson.—*Rolls Court.*—This case was a bill filed for the specific performance of an agreement to take a house in Clifton-gardens, Maida-hill. The agreement was dated in July, 1860, and shortly after taking possession, the defendant (the lessee) discovered that the house was not in such a state of repair as he was of opinion it should be. The plaintiff declining to do the repairs insisted on, the defendant refused to execute the lease, and in February, 1861, quitted possession of the house.

The Master of the Rolls, in giving judgment, said, the question before the Court was whether the house was handed over by the plaintiff to the defendant in such a state of repair as a house of this particular class ought to be. There was no fraud or wilful misrepresentation on either side, the plaintiff evidently believing that the house was in a proper state of repair, and the defendant being convinced it was not. With respect to such an agreement as the one in question, there was no doubt an implied covenant that the house to be let should be in good tenantable repair, and if the lessor did not deliver it in such repair over to the lessee, the latter would not have the retention of it forced upon him. In the present case, if the evidence rested alone upon the affidavits, the Court would have the greatest difficulty in deciding between the parties. But the plaintiff had thought proper to have the defendant and his wife examined *vide roe* in open court, and the result of their evidence, taken in conjunction with that of two most respectable architects and a surveyor, led the Court to hesitate before forcing such a house upon the defendant. As the affidavits, however, were so conflicting, and the impression on the minds of both the plaintiff and defendant so manifestly sincere, the court had determined to see the house and judge for itself. Accordingly he (the Master of the Rolls) had secured the attendance of Mr. Graham (a foreman at Cubitt's) to assist him in forming an opinion on the matter, he having reason to put every confidence in the practical experience of that gentleman. In company with Mr. Graham, he had gone over the house in Clifton-gardens, and from his own observation, supported and in many respects materially assisted by the practical experience of that gentleman, he had come to the conclusion that the house was not in such a state of repair as a house of that class ought to be under such a lease as the one granted. There was nothing to be said against the house generally as a good and solid structure; but the repairs which the defendant would have to make in order to put and sustain it in such a state as it ought to have been when possession was given to him under the lease, would amount to so large a sum that it would be most unjust to hold that it was in such a proper state of repair as would entitle the plaintiff to insist on specific performance of the lease he had granted, and which the defendant repudiated. The result was that the Court would not consent to force the house on the defendant, and the plaintiff's bill must stand dismissed.

LIABILITY OF CONTRACTORS UNDER THE METROPOLITAN BOARD OF WORKS.

Clothier v. Webster.—This was an action, at Maidstone, by a baker, at Woolwich, against a contractor, under the Metropolitan Board of Works, for injury caused to the plaintiff's oven, through the negligence of the defendant in executing certain works for the Board.

The defendant had, in making the sewer, made an excavation under the oven, which had afterwards sunk, so as to require it to be rebuilt, by reason of which the plaintiff was put to expense, and for some weeks disturbed his business, for which he claimed between £30 and £40.

The case for the plaintiff was, that this was caused by the mode of making the excavation, which was denied on the part of the defendant. The evidence on that point was contradictory, and witnesses were called on the part of the defendant to show that every proper precaution had been taken.

Mr. M. Chambers, on behalf of the defendant, submitted that the works had been done in execution of the powers of the Act, and that, therefore, the only remedy of the plaintiff was by a proceeding for compensation under the Act.

The Lord Chief Justice said: That is so, no doubt, except so far as concerned any negligence in the manner of doing the work, for which the contractor would be responsible.

The excavation was made beneath the oven to effect a communication with the main sewer at some distance below. The contract provided for concrete when required by the engineer of the Board, and (in the usual way) specified that all works should be well done, &c., and concrete had been put in so far as required by him, and, as he said, so far as was necessary. There was concrete, however, only as far as the crown of the sewer below, and the space above it, up to the oven, was filled up with chalk and clay, the oven being supported upon it by wooden struts or beams.

Mr. Chambers, in summing up for the defendant, contended that as the contract required concrete only under the orders of the clerk of the works or engineer—who were employed by the Board, and as they were satisfied with what the defendant had done, the maxim of law *respondent superior* applied, and that the Board alone were liable.

The Lord Chief Justice said, he should rule otherwise, reserving the point.

Mr. Chambers then contended, on the evidence for the defendant, that, even assuming that he might in law be liable, he was not liable in fact, for that every possible care had been taken, and the chalk was rammed as closely as it could be.

Mr. Hawkins, in reply on the part of the plaintiff, contended that the ramming down had been badly done, and that for this the contractor was responsible. The oven had gone down, and that was the best proof that the work had not been sufficient. Of course, the people who had done the work would say they had done it well; but the result was the best test, and as the ground gave way, it could not have been well filled in.

The Lord Chief Justice, in summing up the case to the jury, told them that if the contractor had been wanting in due care and skill, he, and not the Board, would be responsible. The great question was whether the excavation had been well filled in. And the point was very pertinent, how, if it was so, the ground came to give way? It was for the jury to say whether, upon the whole of the evidence, there had been a want of reasonable care or skill in the filling up of the excavation? If so, the plaintiff was entitled to a verdict; if otherwise, he was not.

The jury consulted for a few minutes and returned a verdict for the plaintiff.—Damages, £35.

OLD YORK HOUSE.—A few weeks ago inquiry was made as to the existence of any drawing of Old York House—the most famous of all the old London mansions on the river. We are glad to say that hints for a representation of that house in which Charles Brandon and the "Pearl of England" lived, in which Lord Bacon was born, in which Ellesmere died, have been discovered in the drawings of Wyn Graede at the Bodleian. By help of Mr. Cox, the librarian, Mr. E. M. Wurd, R.A., has succeeded in making from Wyn Graede's hints a slight but pretty and spirited sketch of that historical pile which Buckingham pulled down in order to clear the site for Inigo Jones.—*Athenæum*.

TENDERS.

CHAPEL, PRESTON.

For the erection of Moor Park Wesleyan Chapel, Preston. Poulton and Woodman, architects, Reading.

Tomlinson	£3,509	Todd (accepted)	£3,269
Bamber	3,297		

COTTAGE.

For building labourer's cottage and other works, for C. Cannon, Esq. Mr. Henry McCalla, architect.

Mr. Porter (Bunhill-row)

SCHOOLS, ASHTON-UNDER-LYNE.

For the erection of St. Michael's Parish Schools, Ashton-under-Lyne. Hayley and Son, architects, Manchester. Quantities supplied.

Thomas Clay	£3,187	Stores	£2,774
J. and J. Longson	2,993	Terras	2,631
Thackrah and Pearce	2,889	J. Robinson, Jun.	2,425
W. H. Brown	2,760	H. and S. Warburton (accepted)	2,345

ALTERATIONS, CHAMPION-HILL.

For alterations to house, Champion-hill, for R. G. Cooper, Esq. Mr. W. Lee, architect. Coils and Co. £2,340 Newman and Mann

Fish	1,987	Beeton	1,761
------------	-------	--------------	-------

TAVERN, SHOREDITCH.

For rebuilding the Griffin Tavern, Leonard-street, Shoreditch, for Mr. George Heaverman. Mr. William Lee, architect. The tender of Mr. Green has been accepted.

SHOPS, &c., HACKNEY.

For house, shop, show-rooms, &c., Church-street, Hackney, for T. Wilkinson, Esq. Mr. William Lee, architect. Mr. Beeton's tender has been accepted.

ROADWORK, HEREFORD.

For the formation and metalling of a portion of the proposed new roads on the Hampton Park Estate, Hereford. Messrs. Elmslie, Franey, and Haddon, architects.

W. Birchley	£642 17 8	C. Walford	£433 11 6
J. Trumper	473 11 0	W. Scandrett (accepted)	381 18 0

DWELLING HOUSE, ESSEX.

For a house at Witham, Essex, for Charles Page, Esq. Mr. Fred. Chancellor, architect, 13, Pinner's Hall, Old Broad-street, London, and Chelmsford, Essex.

Gardener	£667	Glasscock	£660
Brown	665	Sanders (accepted)	600

SEWER, DUMFRIES (N.B.)

For a main sewer to be constructed in the White Sands, Dumfries.

Murphy and Son	£695 0 0	Allan and Man	£460 17 0
Tough	601 5 11	McCalley	434 17 0
Aitchison	498 0 0	Maxwell (accepted)	409 10 0

VILLA, &c., LEICESTER.

For [the erection of a villa and outbuildings at Great Wigston, near Leicester, for Thomas Ingram, Esq. Quantities supplied by the architect, William Millican, Hotel-street, Leicester.

Tender No. 1.—Brick and Stone Walling.

*Messrs. Osborne	£1,839	Thompson	£1,217

* Including No. 2.

ARBORETUM, WORCESTER.

For the erection of a pavilion in the pleasure grounds, Worcester. Mr. Cranston, architect, Birmingham.

W. Wythes	£899 0 0	W. A. Showell	£740 0 0
J. Hardwicke and Son	855 0 0	G. Arden	725 10 0
T. Edmonds	753 19 0	W. Easie and Co. (accepted)	694 10 0

Architects competing for the above were limited to an expenditure of £300.

COMPETITIONS OPEN.

INFIRMARY.

LONDON.—The managers of the Central London District School desire to have designs for a detached infirmary for their boys' and girls' schools at Cuckoo Farm, Hanwell. The building must be of a simple and inexpensive character, in harmony with the existing buildings, and comprise accommodation as required by the Poor Law Board for 180 boys and 180 girls, each sex to be separately distributed in six rooms. There must also be a kitchen, surgery, waiting-room, and other necessary offices underneath. Particulars on application to the superintendent at the schools. The plans must be drawn to a uniform scale of 8 feet to an inch, each to be accompanied by a specification of the works and an estimate of their cost. No premium will be given, but the architect whose plan is chosen will be paid by commission for supervision, &c., of erection of the building in the usual way. Each set of plans must be subscribed with a motto, and forwarded with a sealed letter, containing the motto and the author's name, to Samuel Heath, Jun. clerk to the Board, No. 10, Basinghall-street, E.C., on or before April 2.

CONTRACTS OPEN.

BANKS.

Bucks.—For the erection of new bank premises, at Aylesbury, Bucks, for the directors of the London and County Bank. Plans and specifications at the London and County Bank, Aylesbury, and with Frederick Chancellor, architect, 10, Pinner's Hall, Old Broad-street, London, and Chelmsford, Essex. Quantities will be supplied. Tenders to be delivered on the 3rd April.

IRELAND.—For erecting a branch bank and manager's residence at Nenagh, co. Tipperary, or the Provincial Bank of Ireland. Plans, &c., at the office of the architect, W. G.

Murray, 68, Lower Gardiner-street, Dublin, up to the 31st inst. on which day estimates are to be forwarded addressed to Thomas Hewat, Esq., Provincial Bank of Ireland, 42, Old Broad-street, London, E.C.

TOWN HALL.

TIVERTON.—For the erection of the new Town-hall, &c., for the Borough of Tiverton. Plans, &c., at the town clerk's office, Peter-street, Tiverton. Sealed tenders endorsed "Tiverton New Town Hall" to be delivered at the town clerk's office, on or before the 2nd of April. Bills of quantities will be supplied by the architect, Mr. H. Lloyd, Tark-street, Bristol.

TODMORDEN.—For arching over the river, and other works in connection with the foundation of the proposed town-hall. Plans, &c., at the office of Mr. Allen, Oddfellows-hall, Todmorden. Sealed tenders, endorsed "Tenders for Town-hall, Todmorden," to be forwarded to Mr. J. Green, architect, Portsmouth-house, near Todmorden, before 2nd April.

BATH.

RYDE.—For a floating bath, 110 feet long by 56 feet wide, with thirty dressing boxes, waiting room, &c., to be constructed of timber, and moored near the pier at Ryde. Plans, &c., at the office of the Company's engineer, Mr. F. Newman, 16, George-street, Ryde, where sealed tenders are to be delivered before noon on the 31st inst.

MARKET.

IRELAND.—For the execution of all the works to be done in connection with the National Cattle Show, at the Limerick New Markets. Plans, &c., on Thursdays and Saturdays, at the secretary's office, 44, Upper Cecil-street, Limerick. Tenders for completing the whole work, including all materials. Tenders for executing all the work, timber to be supplied by Committee. Tenders may state, also, what sum would be allowed for materials after the show. Tenders for gas fittings and plumbers' work to be separate. Sealed tenders, addressed to the chairman of the Local Committee, to be sent into the secretary's office, on or before twelve o'clock, on the 5th April.

GATEWAY.

IRELAND.—For the erection of a new entrance to Knockdrin Castle, Mullingar, for Sir Richard Levinge, Bart., M.P. Plans, &c., at the office of Mr. J. M. Curdy, architect, 1, Harcourt-place, Lower Morrison-street, Dublin. Sealed tenders to be delivered at the above address, on or before the 5th April.

BRIDGES.

TONGE.—For the erection of an iron-girder bridge over the river Irk, in the township of Tonge. Plans, &c., with the surveyor, at his office, Commissioners' Rooms, Middleton, to whom sealed tenders are to be sent, endorsed "Tender for Bridge," not later than 31st March.

MONTGOMERYSHIRE.—For the erection of a plate girder bridge, for Broniarth, Melfod Montgomeryshire, of 100 feet clear waterway, and 18 feet over all. Plans, and specifications can be seen at the office of the county surveyor, Kerry, Montgomeryshire. Broniarth is about 10 miles from the Llanymynech Station, on the Oswestry and Newtown Railway. Tenders by April 7.

READING ROOM.

DORSET.—For the works to be done in the erection of a reading-room at Swanage, Dorset. Plans, &c., at the office of the architect, Mr. G. R. Crickmay, 77, St. Thomas-street, Weymouth. Tenders to be sent in on or before the 31st inst.

ROOF WORK.

BLACKBURN.—For three wrought-iron roofs for the Blackburn Gas-light Company, to be erected upon their No. 1 station, Jubilee-street. Plans, &c., at the Company's offices, Darwen-street. Tenders to C. Parkinson, Esq., chairman of the Company, or before the 31st March.

CHURCHES.

IRELAND.—For works to be done at the churches of Kiltanalea, co. Clare; Ballisakeery, co. Mayo; Kilfree, co. Sligo. Specifications in the hands of the resident ministers of the parishes. Tenders to be forwarded sealed, prepaid, and addressed thus:—"Proposal for Church of ———, The Ecclesiastical Commissioners for Ireland, Dublin," before the 4th of April.

IRELAND.—For the several works to be done in erecting the intended new Roman Catholic Church at Broadford, co. Kildare, for the Rev. Felix Tracey, P.P. Plans, &c., with John S. Butler, Esq., architect, No. 16, Hume-street, Dublin, to the 31st inst.

SUFFOLK.—For taking down the tower of Foxearth Church, near Sudbury, Suffolk, and building a new tower and spire, together with other works. Plans, &c., at the school-room, on the 24th of March, and five following days. Sealed tenders, directed to Rev. John Forster, Foxearth Rectory, on or before the 6th April.

CHAPELS.

CHIPPING NORTON.—For the erection of a Baptist chapel, and the conversion of the present chapel into schools, at Chipping Norton. Plans, &c., at the offices of Messrs. Gibbs, Thompson, and Colbourne, Stratford-upon-Avon, to the 8th of April, where the quantities, &c., may be had on payment of 10s. Tenders to Mr. G. B. Smith, Chipping Norton, on the 9th April.

YORKSHIRE. For the masons', bricklayers', and plasterers' work, carpenters' and joiners' work, plumbing, slating, painting, glazing, &c., for a new Primitive Methodist chapel, to be erected at Gouthrope, Selby. Plans, &c., with Mr. G. Brown. Tenders to the Rev. J. R. Parkinson, Gouthrope-street, before April 5.

MARKET RASEN.—For the whole or for any separate portion of the works required to be done in taking down the present, and erecting a new Wesleyan chapel to accommodate about 700 persons, with schoolroom and vestries adjoining, at Market Rasen. Plans, &c., at the vestry of the present chapel at that place, or duplicates thereof, with William Botterill, architect, 23, Parliament-street, Hull, till the 8th April. Tenders, endorsed "Tender for Wesleyan Chapel, &c.," to be addressed to the Rev. Jos. Oliver, Market Rasen, and must be received by him not later than the 9th April.

CHESHIRE.—For the whole or any part of the works required in the erection of the New Wesleyan Chapel, Chorley, Alderley Edge, Cheshire. Drawings, &c., with Hayley and Son, architects, 45, Cross-street, Manchester, to whom sealed tenders are to be delivered before the 31st inst.

PARSONAGE.

BURY.—For the several works required in the erection of the proposed parsonage house in connection with All Saint's Church, Bury. Particulars at the office of the architect, W. W. Whitaker, 32, St. Ann-street, Manchester, and the estimates to be forwarded to the architect on or before the 1st April.

DWELLING HOUSES.

GOSPORT.—For the alteration and reconstruction of two houses, known as Stoke House, Alverstoke, Gosport. Plans, &c., on the premises, and at the architect's offices, to whom the tenders are to be delivered, on the 31st inst. Quantities will be furnished on application to Charles Sewell, architect, Chandos-chambers, Buckingham-street, Adelphi, London, W.C.

BOW.—For the erection of a small house at Bow, Middlesex. Drawings, &c., at the offices of Mr. Gihlett, surveyor, 36, Southampton-buildings, Chancery-lane. Tenders to be delivered not later than the 31st inst.

CAMBRIDGE.—For the works to be done in restoring the north wall and roof to nave of Kirtling Church, Cambs. Drawings, &c., at the office of Mr. J. F. Clark, architect, Newmarket. Tenders, sealed and endorsed, "Tender for Church Restoration," to be sent to the Rev. W. Chavasse, Kirtling Vicarage, before the 24th inst.

POLICE-STATION.

DEVON.—For the erection of police station, &c., at Northtawton, Devon. Plans, &c., with Henry Ford, Clerk of the Peace, Castle of Exeter, and at the office of Robert Fulford, Esq., clerk to the Justices, Northtawton. Sealed tenders endorsed, "Tender for Northtawton Police Station," to be sent to Mr. Ford on or before the 1st April.

RAILWAYS.

INVERNESS AND PERTH JUNCTION.—The directors are prepared to receive tenders for the construction of two additional sections of the line, viz.:—1. the Dalnacardoch contract, extending 12 miles 1,383 yards or thereby, and comprising about 40 bridges and culverts for roads and streams, the span of the largest bridge being 60 feet. The excavations consist of about 250,000 cubic yards, including some rock. 2. The Aviemore contract, extending from the river Duluin to a point near Kinrara, measuring about twelve miles

1,140 yards. The excavations on this section are almost wholly gravel, and comprise about 300,000 cubic yards, and the bridges are about 14 in number, the largest being a girder bridge over the river Duluin, of 80 feet span. The rails, chairs, sleepers, spikes, fish-plates, and bolts will be supplied by the Railway Company. Drawings, &c., at the offices of Joseph Mitchell, Esq., C.E., Inverness, from whom, or from the assistant engineer on the line, duplicate schedules may be obtained at £2 2s. each. The cost of the detailed measurements will fall to be paid by the successful contractors. The line is staked out a distance of every 100 feet, according to the working sections. The deepest entrenchments are also pitted to ascertain the nature of the materials in the excavations. An assistant engineer will be at Blair Hotel, Blair-Athole, on 1st April at 10 o'clock a.m., to accompany contractors over the Dalnacardoch Contract; and at Lynvnlig, Kinrara, on 3rd of April, at twelve o'clock noon, to accompany contractors over the Aviemore Contract, and point out the works and the sites of the bridges. Draft-contracts proposed to be entered into will be seen with the assistant-engineer, or at Mr. Mitchell's office, on and after the 26th. Sealed tenders, addressed to the secretary, and marked "Tenders for Inverness and Perth Junction Railway Works, 'Dalnacardoch' or 'Aviemore Contract,'" as the case may be, must be lodged at his office on or before the 9th April, at twelve noon.

MASON WORK, &c.

CLEVEDON.—For the execution of various masonry and other works in the Clevedon district. Plans, &c., with Mr. G. Turner, surveyor. Sealed tenders for the whole, or any part or parts of the work, as shown in the plans, to be delivered to Mr. Turner, on or before 8th April.

COASTGUARD STATION.

DEVON.—For the erection of a coastguard station, at Clevelly, near Bideford, in the county of Devon. Drawings, &c., at the Custom-house, Bideford, or at the Admiralty Coastguard office, 12, Spring-gardens, London, S.W. Tenders to the Admiralty office not later than noon on the 7th April, under seal, and directed to the Commodore Controller General for Coastguard, and endorsed "Tender for Clevelly Station."

GASWORKS.

BLACKBURN.—The Blackburn Gaslight Company ask for tenders for the erection of a purifying-house and double retort-house, upon their No. 1 station, Jubilee-street. Plans, &c., at the Company's offices, Darwen-street. Tenders to be addressed to C. Parkinson, Esq., chairman to the Blackburn Gaslight Company, on or before the 31st March.

BRENTWOOD.—For the erection of a new gasholder, 40 feet in diameter, by 18 feet deep, with cast-iron columns, girders, &c., at the works of the Brentwood Gaslight and Coke Company, situated at Brentwood. Plans, &c., with the secretary, to whom sealed tenders are to be sent on or before the 4th April next.

FARM BUILDINGS, &c.

WILTS.—For the erection of farm-houses, extensive farm steadings, and numerous labourers' cottages upon the Earl of Pembroke's estate. Tenders to Mr. Clarke, architect, Corn Market-house, Salisbury, on or before the 7th April.

POYNINGS.—The Commissioner of Woods and Forests ask for tenders for the erection of two pairs of labourers' cottages, additions to farm buildings and other works, at Poynings, near Hursley-pierpoint, in the county of Sussex. The plans, &c., lay with Mr. J. Hollingdale, Woodreave, Poynings. Tenders to be addressed to the Hon. Charles Gore, office of Woods (Whitehall-place, Westminster, S.W.), endorsed, "Tenders for works at Poynings," to be sent in on or before 12 o'clock, on the 31st inst.

LINCOLNSHIRE.—For the several works required in the erection of a new farmstead, at Fotherby, for Everett Allenby, Esq. Plans, &c., with Jas. Fowler, architect, Louth.

COURT HOUSE.

BLACKBURN.—For the erection of a building, at Blackburn, for the sittings and business of the county court. Plans, &c., at the County Court office, Blackburn, until the 8th of April, on which day the tenders are to be sent (naming one sum for the whole of the work) to Robert Bendle, Esq., treasurer of county courts, Carlisle.

SEWERAGE.

HAMPSTEAD.—The vestry of the parish of St. John, Hampstead, Middlesex, ask for tenders for the laying down, constructing, and completely finishing certain intended brick and pipe sewers, 5,390 feet in length, or thereabouts, with other works in connection therewith, in Church-row, Frognal, and other places in and near the town of Hampstead; and for the maintenance of such works in complete repair for twelve calendar months. Plans, &c., and form of tender, may be inspected, and copies of tender and specification may be had on payment of 2s. per copy; and other particulars obtained at the surveyor's office, New-end, Hampstead. Sealed tenders, in the printed form only, addressed to the vestry clerk, must be delivered at the vestry offices on or before the 4th of April.

MANCHESTER ARCHITECTURAL ASSOCIATION.—At the meeting of this Association, held on Wednesday last, Mr. R. W. Aitken read a paper on "Botany in relation to Architectural Design," in which he proceeded to review the characteristics of the various leading styles in connection with their relative possession of the attributes of "fitness, simplicity, beauty, and expression;" and in referring to the primal sources of all decoration, viz., utility and beauty, remarked that, "The development of utility as first in order was natural, inasmuch as it is especially connected with man's physical being; beauty, with his intellectual; utility was necessary to his life as a creature, beauty to his existence as a human being. Having secured his physical comfort by the erection of a shelter from the external elements, and thereby developing utility in construction, he would not rest contented till construction should elaborate itself into decoration, and his intellect receive thereby something to satiate its wants."

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

C. P. H.—Not within our province to advise on such matters.

GOTH.—Received.

T. R. H. (Over Darwen.)—Probably next week.

INDIAN INK.—1. It would seem that a charge should be made of 5 per cent. on the amount of contract, less the usual charge of superintending the portion of the work not executed. 2. The client must pay the surveyor's charges for taking out quantities. 3. Certainly not; no such charge is justifiable.

M. W. W.—Thanks.

COSMOPOLITAN.—Next week.

P. W. Z.—We can make no promise until we have seen the drawings.

R.—Send name and address.

A COUNTRY BUILDER.—However desirous we may be to oblige our readers, we cannot go over half London to seek information, which they will find in our advertisement columns.

PROVINCIAL SUBSCRIBER.—We are at all times happy to hear from our provincial subscribers.

X.—Totally without foundation; this fact must be obvious.

ANONYMOUS.—We do not care to discuss the point.

W. W. T. C.M.—Declined with thanks.

S.—Shall hear from us.

W. E. N.—Thanks; shall have attention.

R. B.—Send papers referred to.

J. H. K.—Drawing shall be returned.

P.—Deferred for want of space.

. All communications to be addressed, The Editor of the BUILDING NEWS, 20, Old Broad-street, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 18 to 21, Old Broad-street. Advertisements are received up to six o'clock on Thursdays.

THE PUGIN COLLECTION AT THE ARCHITECTURAL EXHIBITION.

BS we mentioned incidentally last week, nearly the whole of the West Gallery at the Architectural Exhibition is occupied by a collection of the unpublished sketches of the late Augustus Welby Pugin. The trifling exceptions refer only to a few drawings of buildings designed by his son, which, we venture to think, would have been more fittingly hung in the adjoining galleries amongst the works of other living architects. They have no merit in common with the handiwork of the architect to whom the gallery is dedicated than have the works of others of his followers; and, valuable as they are as architectural designs,

their position, tacked to the great objects of attraction, smacks too much of intrusiveness. Mr. Edward W. Pugin's designs really need no borrowed light; they should not, therefore, be so placed as to kindle a suspicion that they required it. Their place should have been amidst rivals; in the bustle and the crowd of living men—to carry forward by their own merit the colours, honoured by the life-devotion of an illustrious sire, not ostentatiously attached to the silent trophies of his long, but now ended, struggle. Moreover, if the object

were to render them conspicuous, no position could be more ill-chosen for them. After examining, as they deserve to be examined, nearly a thousand drawings by the elder Pugin, we are in no mood to dwell attentively upon the designs of the younger. The reflections which this gorgeous illustration of Pugin's industrious and useful life occasion, and the interest which the faithful representations of world-famous architectural piles kindle in us, is continued so long as the same dexterous hand which sketched them introduces us with the same firm but tender touch to its own created forms; but it cannot be sustained to another's work. Having fed for hours upon Chartres and Amiens, Rouen and Florence, Evreux, Coutances, and Bayeux, all drawn lovingly by the man who, in his day, perhaps, alone fully appreciated them, we cannot be blamed if we pass by untouched the Beauchamp Almshouses, in the County of Worcester. We have no fault to find with the design or drawing of these latter, but, like every one who enters that nobly-lined gallery, we come to ponder over the memorials of the father, and do not expect to find them interlarded with extraneous matter by the son. As in Mr. Ferrey's book, the "memorials" are not altogether what they might have been, either in quantity or arrangement, and the "appendix" is quite superfluous.

Immense as is the labour visible in this gallery, we cannot but recall the fact that it contains but a fraction of Pugin's work. There are no drawings here which have been already published; no record of his many designs, decorative as well as architectural; even of St. George's, Southwark, we recognised but one drawing—of the chancel screen. A bird's-eye view, with smaller views in the illuminated border, is the only illustration of St. Augustine's, Ramsgate; and a single frame, similarly filled, gives us an equally inadequate notion of the many hours of toil which Pugin devoted to Bilton Grange. Of the assistance which Pugin rendered to Sir Charles Barry in the decorations of the Houses of Parliament, this exhibition tells us nothing, and it is as silent also upon many other similarly important works of the hard-working man whose services it seeks to commemorate. We cannot even say that it contains an epitome of his labours. We may, indeed, trace the growth of his mind from almost its earliest shoot though brilliant study unto its autumn ripeness, but there are evident gaps which a more careful collector might easily, we fancy, have supplied. We require to know all about Pugin before we enter this gallery, and, in order to appreciate what we see here, to recollect what he has done, of which there is here no indication. When we remember, for instance, with what masterly skill he designed metal work, the sketches made in the Ancient Treasury of St. Stephen's, at Vienna, have a peculiar interest, which, as mere barren studies, they would not possess. Again, his power of illumination, long before it became *fashionable*, was, as we here see, strengthened in the Public Library, at Rouen. From the picture galleries of Florence, from stained-glass windows, and from old half-ruined statues, he gleaned his knowledge of costume. His memoranda are here seen to have been rapidly made, with written notes of the colour or of other peculiarities which he saw in them. The embroidered vestments of the Italian priests, or rather the ornaments upon them, were noted down by him. Nothing—from the picturesque gables and spires which, in some ancient town, were grouped, as they had been for centuries, around the venerable cathedral, to the petals of a flower which unfolded its simple beauties beneath his feet, or the warm glow of a common candle's flame—escaped his searching eye, or was left unrecorded by his obedient hand;

and yet how often, spite of his untiring energy and his wondrous sketching facility, he must have wished for as many hands as he had hairs, that he might have made them as subservient to the great object of his life as were his every thought and action. We cannot think of Pugin and forget, although his staff be broken, that it was he who "made gape the pine," and let the delicate Ariel out; that to his fierce enthusiasm, to his singleness of purpose, to his spirit, unbending, as the knotted oak, to falsehood or dissimulation, but ever ready to sacrifice to the cause he served, we owe our advanced position, not only in Gothic, but in truthful art. We might, perhaps, have gained our present position without him, but it would have been years hence. His designs might, perhaps, occasionally suffer by comparison with those of many of his followers, but their labours could no more compete with his than a mole-hill with Olympus. He worked, without even a clerk, by the feeble light which he himself struck and kept burning amidst darkness and distrust. We now work illumined by the full brilliancy of his shining examples. We have skilled assistants to help us. We are encouraged by the approving shouts of believers in true principles instead of being, as he was, distracted by the roar and the hiss of opposition. English Churchmen, as well as Romanists, Baptists, and Presbyters, now all bend before and beneath the revived Gothic art. Pugin found very little sympathy even in the church which he beautified and enriched. Like the old builders, who, with trowel in hand and sword by their side, erected the second temple, he was obliged to keep his pointed pen ever ready to defend the pointed art which his pencil delineated against the attacks of his enemies. Those enemies have melted away like mist before the sun, and it is to their honour, no less than to his, that they were more ready, even than those of the creed which Pugin signally and unselfishly served, to do honour to his memory. But we are approaching tender ground when we seek only to signal to one and all by whom the old art is acknowledged, the gems which are offered to their gaze from the treasury of their noblest predecessor.

We have mentioned the absence of all Pugin's drawings for his published works. This deficiency may, without difficulty, be partially supplied by depositing on the table in the gallery a collection of the books which he periodically issued. They would be more welcome than the glass case now in the gallery, which holds specimens, unconnected with Pugin, of the photographer's skill who is about to publish these exhibited sketches. We should like to see the gallery as complete as possible with Pugin memorials, and to see the sketches better arranged. We have now some sketches belonging to one series inserted amongst those of another; others have no names attached to them, and a stranger to the subject is provoked by seeing something good, and at being at the same time left in ignorance of its whereabouts. Even where the name is vouchsafed to us, it is only in Pugin's illegible writing. The little scrap of description in the catalogue under the head of West Gallery, besides being meagre, contains an important error. In it the north side is filled with two different sets of drawings, whilst, apparently, the south side is left blank. North is, of course, written for south in one case, but such an error ought not to have escaped the proof-reader.

On the north we have, in fact, 117 designs and plans for the restoration of Balliol College, Oxford, together with a large collection of sketches from Avignon, Florence, Milan, &c. On the opposite or south wall we have eleven drawings, constituting the Scarsbrick Hall designs, with seventy sketches from Chartres, Lisieux, Evreux, Caen, Coutances, and Bayeux. On the west wall a series of sketches, chiefly English, large drawings of Bilton Grange, and St. Augustine's, Ramsgate, and the grand portrait of Pugin, by J. R. Herbert, R.A. On screen No. 1 we have a series of 160 original designs, and on the other five screens 370 foreign sketches.

Now, what we complain of is that there is no system in this arrangement, and that there ought to have been. Either they ought to have been classed in countries—as, for instance, the "French," "Italian," and "English" sketches—or in the order of their execution; or else according to subject, putting metal work together, ornament by itself, and costume, colour, composition, and detail, each under its own distinctive heading. Either of these different arrangements would have been simple enough, instead of which they are sorted with that eye to art, and with that spirit of order, which is seen only in a child's kaleidoscope. Nestled amidst finished and later works, we light by chance upon, perhaps, Pugin's earliest exhibited work, a "View from the back of the Hotel Bourbon, Rue Jacob." It is dated September, 1827. It has not his customary quaint signature, and was drawn evidently before he had adopted it. It is elaborately shaded, but does not show the masterly touch seen in the sketch of the "Well at Amiens" by the side of it. This latter sketch is the *beau ideal* of what an architect's sketch should be—a small perspective view, with enlarged geometrical sketches of every portion.

We have already hinted at Pugin's restless energy. When on board ship his pencil was still at work. One little sketch amongst the Italian and French sketches on the north wall, of the deck of a vessel, is exquisitely touched in. His sketches of Carcassonne Cathedral show that he never wasted time in making good-looking drawings. All that was likely to be useful to him in a building he drew, but no more. When he had nothing useful to draw he exercised his hand by sketching anything he could see. Hence we have the deck of a vessel, several views of St. Marie's Grange, a candle lighting up a curtain, &c. The palace of the Popes at Avignon was sketched, perhaps, from the interest he took in, and the reverence which he felt for, the head of his Church. His Venice sketches are rather poor. He seems to have appreciated Venetian art about as much as the historian of the "Stones of Venice" appreciated him. Giotto's chapel at Florence is shown us in a few lines. To one who

has not seen the original it is a bald representation, but to those who have seen it, Pugin's sketch perfectly recalls it. So it is, in a great measure, with the majority of Pugin's sketches. They were intended as aids to his memory, not as finished representations. One screen—the one in the north-west end of the gallery—contains a series of finished drawings for a contemplated work. As far as we can gather without that guide which we had a right to expect in the catalogue, it is a design for a chateau and for St. Mary's College. Both drawing and design enlist our warmest admiration; every detail is carried out with the same scrupulous care which characterises the elevations and plans. Nothing is left to be designed by assistants, by decorators, by stone or wood carvers, or by metal-workers. Pugin was above that kind of practice; from laying the first stone to carving the last finial he was the only architect of his work. Locks and keys, linen-chests, bells, crockets, wall decorations, inscriptions, stained glass, washing-stands, bookshelves, bedsteads, curtains—he designed them all upon the true principles which were the foundation of his too short life. Such a thorough, manly character is not often met with, but, when encountered, should be “grappled to our soul with hooks of steel.” He had failings, like the rest of us, but they lie beneath the stone which bears his illustrious name. The result of his short but laborious life is seen wherever the pointed arch rises emancipated from deadly depreciation—wherever the newly carved crocket climbs or the finial bursts in beauty—wherever the solemn clang issues from Gothic spires or the groined vault echoes the sacred chant—wherever richly coloured light shines through the traceried window or the deeply recessed oriel. In cottage and in cathedral, and in the long list of buildings which fill the gap between them, we may trace, in a greater or lesser degree, the victory which he initiated, and in the struggle for which he was ever foremost. The task he set himself was taken from his fallen hand and completed; but the honour belongs to him, and none are more free to acknowledge it than those who now gather their crops peacefully in the field where he, dauntless, in the midst of darkness and difficulty, drove the first furrow.

By the way, we have heard numerous complaints of the extra charge of a shilling made for admission to this collection. The Committee of the Architectural Exhibition ought certainly to have dispensed with it. The Pugin Collection is very useful to it in filling a gallery which would otherwise have been empty and a revelation of their poverty. The advertisement which the Exhibition gives to the proposed publication ought to satisfy the publisher of the Pugin Collection, without imposing a tax upon every visitor. The sooner the two parties come to some arrangement which will relieve the visitors of their cause of complaint the better it will be, we think, for the tenants of both galleries. At all events, as the contents of all the galleries have been hitherto shown for one shilling, they might divide that sum, charging sixpence for each collection; but the better plan undoubtedly would be to restore to us the scale of former years, and to let the Pugin Collection rank as part and parcel of the Architectural Exhibition. This ought to have been so settled at first, before the Exhibition opened; but it is not too late now to retrace a wrong step and to remove the cause of justifiable irritation.

BRITISH MUSEUM.

WE are requested to make known the following special regulations respecting admission to the British Museum:—

In order to give the public generally the utmost facilities for seeing the British Museum during the time of the International Exhibition at Kensington, the Trustees have laid down the following special regulations:—

1. That the Museum, instead of being closed from the 1st to the 7th May next, be closed on Monday, the 28th of April, and re-opened on the following Monday, the 5th of May.
2. That from the 5th of May to the 30th of August inclusive, the reading-room be kept open for readers, as usual, daily, Sundays only excepted; but not later than 5 o'clock.
3. That the Museum collections, including those parts of the library of printed books and manuscripts, to which visitors are now admitted on public days, be kept open daily, Thursdays and Sundays excepted, from 10 o'clock in the morning till 8 in the evening, during the months of May, June, July, and to the 16th of August, inclusive, but till half-past 7 only for the remainder of that month.
4. That during the same months and days the reading-room, and a small portion of the libraries annexed to it, as well as the whole of the north library, with the exception of its western extremity, be open for the admission of the public generally, only from 5 o'clock to 8, or half-past 7, as before mentioned; and that from 9 to 5 o'clock none but readers, for the purpose of study, be admitted to the reading-room, or to any of the libraries, except such of the rooms as are usually accessible to visitors throughout the year on public days.
5. That after 5 o'clock the reading-room and the libraries generally, be not used for the purposes of study.
6. That Thursdays be reserved for cleaning the several departments, and that no visitors, excepting readers, be admitted into the Museum on that day.

A. PANIZZI, Principal Librarian.

British Museum, March 24, 1862.

THE STATE PAPER OFFICE.—This structure, erected thirty years ago, is to be taken down; and the work of demolition will be commenced in a week or two, for the purpose of clearing the space for the new Government offices. All the documents contained in the State Paper Office will be transferred to the new buildings on the Rolls estate, in Fetter-lane, where readers will in future have the opportunity of consulting them. The accommodation is small at present, but the Master of the Rolls is taking measures to extend it.

CRITICISM.

CRITICISM is a subject upon which an idea which is certainly insufficient, and may be fairly said to be erroneous, is generally held, for the popular notion about it embraces little beyond fault-finding, and the minute and hostile examination of individual works, or even of detached portions of works. The idea that hearty praise, or a general appreciation of excellencies, great or small, should form part of it, is one far from universally held; and the fact that broad views and general principles lie at the base of all sound criticism, and are the first and most legitimate objects upon which it should be exercised, is still less generally appreciated. And yet both of these things are true, and need to be emphatically recalled to the recollection of many who attempt to criticise works of art, and the artists who produce them.

Criticism is a word identical in original meaning with judgment, but by one of those subtle processes with which the history of language abounds, we have restricted the use of the one word to mean judging of works of art or literature, while the other is made to embrace the consideration of all classes of subjects upon which an opinion has to be formed without distinction.

If it be understood, then, that the art of criticising ought to be held to mean the art of judging of certain products of human genius and skill, it will be readily perceived that the mere utterance of oracular *dicta* upon individual poems or pictures, books or buildings, will be but a part, and by no means the noblest part, of this art of judging. Solid grounds upon which to form opinions must be laid down. Sound principles of reasoning, and a suitable temper of mind must be acquired, and the art of correctly applying to individual cases broad principles already ascertained must be cultivated with care.

For the first, patient and accurate observation and a retentive memory are necessary; for the second, powers of generalising and of logical reasoning are essential; while the third requires much familiarity with the nature of the objects under consideration, as well as with the principles by the light of which they are to be viewed.

A critic—at any rate a critic of the fine arts—is not to be regarded as a judge sitting to execute law; his sphere is, at the present day, and will for long if not for ever remain a wider one, embracing quite as much the inquiry into the laws by which works of art ought to be regulated as that into the degree in which any given works of art have complied with or transgressed a given rule.

This is not the case in literature to the same extent as in the arts. The methods of human thought and the rules of literary composition have been more distinctly laid down, and traditions of criticism more directly handed down to us, than those of artistic design. It is not because there is less actually a right and a wrong in art than in literature, that the principles of the one are less clearly known or held than those of the other, but because literature has been almost continuously studied from the times of the greatness of Greece till the present day, while art has been followed fitfully and at intervals. And further, in our own country, as, in fact in all Europe, literature, in its rudiments or its refinements, has been universally taught in schools, colleges, and all places of learning, while art has been as constantly overlooked, so that those who would blush to utter a false quantity, or to write bad grammar, will unhesitatingly call Italian art pure Grecian, or declare in favour of the most glaringly inharmonious colouring or defective drawing, unaware that the one fault is of precisely the same character as the other; both alike betray ignorance of the rudiments of what ought to be the ordinary knowledge of a person of good education.

The same thing is true of thought and judgment, as well as of mere matters of information. You will find men of ordinary accomplishments, capable of weighing the relative merits of prose or verse writers, able to point out the defects in style of authors, their points of similarity or of contrast, and the reasons of their higher or lower position assigned to them; but there are, comparatively speaking, very few familiar with the works, the merits, the defects, the resemblances, and the differences between various schools of art, and between individual architects, sculptors, painters, or musicians. Still fewer are there at all capable of pointing out the grounds upon which such judgments ought to be formed, even if they themselves have arrived at decided opinions as to certain artists or certain schools.

The majority of great artists have never accustomed themselves to that accurate investigation of their own ideas, or that precise use of language which would enable them to embody in words the principles upon which they have worked—principles constantly underlying all their work, and yet, in many cases, never shaped to their mind in the form of rules; just as we may enjoy the perfect use of our mother tongue, and may speak it correctly, without having ever learned its grammar or its syntax systematically. We have consequently to seek in the works of artists, rather than from their written or spoken words, traces of the laws they have deduced from an observation of nature, or of other artists, for their own guidance.

The want of general information in the public mind relative to the arts is a great misfortune, but the want of carefully wrought out criticism, of admitted and well-founded maxims to guide the practice of artists and the opinions of their observers, and of simple, yet logically incontrovertible principles for those maxims to be based on, is a far greater misfortune, and one which presses alike upon artists and the general public. To the establishment of these, then, should the highest efforts of criticism be directed, for it is only in accordance with well established principles that individual works of art should be critically investigated.

Architecture—if free from some of the difficulties which beset painting

and sculpture on the one hand, and music on the other—is, nevertheless, a subject needing deep investigation, as will best appear if we come to examine the opinions held by the most eminent artists in that field of art, or advanced by those who criticise their works.

Our ideas are in complete confusion—one man declaring in favour of symmetry, another in favour of picturesque confusion; one maintaining the superiority of Pointed Gothic, a second of Romanesque, and a third of Classic; while here we have one artist depending entirely on form and proportion, there a second making everything subservient to colour, and again, a third willing to see excellence in architecture only in proportion as it is enriched by sculpture.

This is not, however, the worst, if only these artists would refrain from depreciating that which they do not themselves pursue; for each of these minds has got hold of one thread out of the great skein which must be twined together to form the perfect combination necessary to complete architectural art, and so far as a portion of the truth is seized upon, and held to, and worked by, so far all is well. Symmetry and picturesqueness, Gothic, Romanesque, Renaissance, proportion and colour, are each excellent portions of true architecture—nay, more, each one of these comprehensive words means so much that it may be quite enough to form the main feature of the architecture of one building, of one man, of one generation.

It is, however, when we come to find how exclusively each believer holds his faith; how the Gothic artist cannot believe that the Classicist may be right also; and the colourist cannot see beauty in fine form when in monochrome;—it is when we meet with bigotry, intolerance, and narrow-mindedness, that we begin to understand how much of ignorance we are all steeped in; how far Pugin's or any other authorities' "true principles" lag behind the external truths of nature, and how much we yet have to learn.

The last two centuries, unfavourable as they have proved to the arts, have witnessed an extraordinary and magnificent advance in the study of physical science, and the mutual relations of all the sciences to one another have been just as markedly brought into prominence as the facts and laws of the sciences themselves. Without doubt all true art is as much a whole as is all nature, and the obstinacy with which we persist in not only splitting the art into fragments but also in neglecting every fragment but one, and then condemning those who have fixed upon any fragment except the particular one we ourselves are enamoured of, shows how far we are still removed from a true critical understanding of what we are about.

The moral of all this is, that it behoves us to study the art of architecture with the direct aim of establishing its first principles, and only to criticise so far as we feel sure of having solid ground to go upon. The method of studying architecture most usually adopted has hitherto been the historical; and while no method could be better adapted for interesting the student, and for enabling him to remember with accuracy the facts with which his mind ought to be stored, historical study can be—often has been—pursued far without the necessity of investigating or understanding the principles of architecture as an art.

The value of the study of architecture as an embodiment of the great principles which belong to all the arts, coloured by and adapted to its peculiar requirements as constructive rather than purely ideal, has been till now too little recognised; it presents the noblest possible field for investigation, and, perhaps, no literature is of so much value to the architect as the attempts, more or less fragmentary as they have always hitherto been, which have been made to occupy this field.

The palm of honour here undoubtedly belongs to our eloquent but erratic art-critic, John Ruskin. Admitting fully the imperfections of his works—imperfections which have been remorselessly held up to light by many who have failed to mark much else—we cannot but remember with gratitude the efforts he has made to analyse the nature of architecture, viewed in relation at once to the necessities of construction and the fundamental principles of art.

Parts of the "Seven Lamps," and the first volume of the "Stones of Venice," will recur to the minds of those familiar with the works of Mr. Ruskin, and these alone would form a magnificent contribution to our stores of art literature. We are disposed also to think that his introduction of references to other arts while architecture is under special consideration, and to this art, in publications devoted to the more especial investigation of natural scenery, or of painting, are most valuable, as tending to rouse a feeling of the mutual dependence and relationship of all the fine arts, and to induce a comprehensive grasp of great principles.

We owe it to Ruskin if the English public is beginning to think and judge intelligently of architecture, and perhaps we owe it also to him if some of our architects are themselves beginning to think of what they are about. We have, however, barely made a commencement. With space diminished by our travelling facilities, distance annihilated by the photographic art, and the accumulations of all time placed at our disposal in a manner hitherto impossible, is it too much to hope that this generation shall witness a general spread among artists and people of comprehensive knowledge? We think not; and we confidently believe that an increasing appreciation of the excellence of all art, and an intelligent application of cultivated taste and well trained reasoning powers to the study of the art of architecture will, at no distant day, enable us to supersede many of our present, imperfect, partial, and prejudicial views by enlightened, truthful, and comprehensive critical judgment, founded upon the immutable truths of nature.

THE MANAGEMENT OF OUR ART INSTITUTIONS.

FOR several years every one who has taken even a faint interest in the management of our art-collections has been convinced of the utter inadequacy of the existing system to fulfil the duties which fall upon it. It has no public defenders. Its only armour is that which has in the course of years sluggishly grown upon it, but at the sound of approaching opposition instinct rather than activity causes it to enfold itself in this impenetrable and mysterious veil; calm and, apparently, indifferent, it evinces no sign of animation, however heavy or stinging may be the attacks upon it. Vulnerable points are periodically discovered, and sharp weapons are sheathed therein to their very hilts, but no quiver betokens internal disturbance or discomfort. There is no ebb of the vital tide, no relaxation of its tenacious grasp. There is neither life nor usefulness apparent in it until the spring-time comes, when it opens its voracious mouth, swallows the yearly-increasing Parliamentary grant, and then sinks again into a state of abnormous lethargy. In all other public matters we have some minister responsible for the expenditure upon them. The funds devoted to our art-galleries escape such inconvenient interference. The money may be improperly expended; pictures may be bought as works of art and sold as rubbish; but an elegantly turned sentence from the Chancellor of the Exchequer repudiating all responsibility is all the satisfaction which Government can afford to any complainant. The keeper of the National Portrait Gallery may enjoy his "dignified repose" at the public expense in Great George-street, but the only answer to inquiry is that it "is still an infant institution;" we must, therefore, make no clamorous noise around its cot, but submit meekly to the thralldom of its expensive monthly nurse, thankful that even the smallest of brass plates indicates the whereabouts of the bantling, and that we are even occasionally allowed to look, and expect, of course, to smile approvingly, upon its undeveloped beauty. The British Museum may be covered with unhealthy spots, its treatment may be condemned by its own officers, but no public control must, on any account, interfere with it. "The Trustees" are professedly responsible, but for any real responsibility which we can touch and handle as tangibly as they touch the public money, we might as profitably have a Board of Afghans or New Zealanders. Ministers who never otherwise go near the British Museum will, when they are wanted, go there to pass a cut-and-dried resolution, but they go as *ex officio* Trustees and not as Ministers who have to answer to the House of Commons for their actions.

The rotten system is defended by no Government, and yet each successive Chancellor of the Exchequer, whilst acknowledging the evil, puts forth some kind of palliation for, and asks us to submit a little longer to it. Whenever the subject is brought before Parliament it offers an opportunity for a very ingenious speech. No one could fence more skillfully with the question than did Mr. Gladstone lately but throughout the whole of his speech he never for an instant grappled it fairly and manfully. The real point demanded was that for the preparation of any estimate, and for the expenditure of any money, voted in aid of the British Museum, the National Gallery, and other art-institutions, one minister of the Crown should be responsible to the House of Commons. The resolution was clearly understood by every member, and by no one more so than by Mr. Gladstone; yet, how did he answer it? By admitting that the motion contained "little that is open to dispute;" that the speech of Lord H. Lennox was one "tending in the right direction towards unity, responsibility, and efficiency in the management of institutions of great public importance;" and then, without venturing to offer a negative to the motion, he cleverly led the members off on a wrong scent, by showing that the mover and seconder of the address differed in the details of their respective remedies. Because Lord H. Lennox and Mr. Gregory did not agree in a minor matter, he "passed by" that portion of the subject; because the National Portrait Gallery is an infant institution, he finds therein a reason for passing by also the criticism applied to it. It is to no purpose that Lord Lennox showed that the National Portrait Gallery costs the country something like 18s. for every visitor to it. The charge is avoided—not met. But he proposed to make a stand on behalf of the British Museum. Committee after committee, we are told, has sat upon the British Museum, which shows that the mind of the country and of Parliament was beginning, for the first time in our history, to be turned to the subjects of art and science and education, as matters of political concern. The very fact of those committees sitting one after the other proves, we should have thought, that the government of those institutions was imperfect—that there existed obstacles to their full development, and barriers to their improvement; and when we call to mind that the deliberate opinions of those committees have been disregarded, and that the constitution of the Museum remains unchanged in spite of them, we cannot be far wrong in concluding that the time is come when a resolution founded mainly upon their reports should be adopted by the House of Commons.

Throughout the whole of his dexterous address Mr. Gladstone proceeded on one plan. In one sentence he admitted the statements of the proposer of the resolution, and then, in the next, threw a veil over the concession. Whilst we say that the administration of these institutions is practically defective, the Chancellor of the Exchequer says they are "theoretically and speculatively imperfect." Whilst we think that the sooner the batch of administrative irresponsible Trustees are replaced by one responsible minister of the Crown the better will it be for the growth of art, Mr. Gladstone thinks that the constitution of the administrative body may fairly, "at some future time," be submitted to reconsideration and revision. Having admitted so much, he trotted out the subject of a removal of the Natural History Collection in order to distract the attention of the House from the main question, which was, that whatever public money is to be

expended, and whatever arrangements are made in consequence of that expenditure, ought to be placed under the direction of a responsible minister of the Crown.

Within the last fourteen years upwards of £2,200,000 has been voted without the faintest personal or individual responsibility. We know that we have different Boards of Trustees composed of the most heterogeneous members, and of the most cumbrous character; that the greater half of them are as ignorant of, as they are indifferent to, what the lesser half does; that some hold their offices on account of theological, and others on account of political, eminence; that some have a seat at the Board because their great ancestors took an interest in some special department of antiquities, and either gave or sold them to the nation; but that few take their seats at the Boards in consequence of their knowledge of art, or of their ability to give their time to promoting its growth. Moreover, we know that the opinions of the working few can at any meeting be overruled by the majority, who know nothing about the subject, and who consequently think it wise to allow things to remain as they are rather than necessitate even a small amount of thought upon the consequence of any proposed change; that whatever jobbery oozes out, we might as well grasp at a ball of quicksilver as attempt to get hold of a responsible person.

We are asked to reserve our strictures until the proper time for considering the matter, and, after waiting, are then told that the proper time has gone by. Every kind of evasion is resorted to in order to silence opponents, and every subterfuge adopted to stifle inquiry. A plea of guilty is put in to avoid exposure, and then a point of law is raised which sentence should be deferred, thus making the discussion refer but slightly to the indictment.

It is high time that these tactics should be abandoned, and that the question should be decided upon its merits. Lord H. Lennox may see a vista of promise in the speech of the Chancellor of the Exchequer. We can discern there only a desert mirage, and on reaching it we shall expect another attempt to flatter us into silence by a repetition of the illusive promise.

What is required for the interest of art is, a minister with a seat in the Cabinet, who shall be entrusted with authority over our art-institutions, and over our public monuments, and who shall be responsible to the House of Commons, and through it to the country, for the expended money and for the works it is spent upon. When we have that concession made to us we shall have plenty of improvements to make in the management of our art-institutions, but until we possess a responsible director of this department, all reports of committees on the subject and all suggestions as to their adoption are, it is to be feared, but as seed scattered in stony places.

WORKS AT THE PORT OF SWANSEA.*

THE Port of Swansea was situated in the centre of an extensive bay, at the embouchure of the River Tawe, up which the tide flowed for a distance of three miles; but, as the ordinary flow of the river was trifling, the maintenance of the channel was chiefly dependent upon the ebb and flow of a large body of tidal water between the piers. Previous to the year 1791 there were only a few insignificant wharves near the mouth of the river, and there was a bar at the entrance, over which the depth of water did not exceed from 16 to 17 feet at spring tides. The effect of the construction of the piers, which still remained as they were completed in the year 1800, from the designs of Captain Huddart, F.R.S., had been to lower the bar and to drive it further out to sea; so that in 1831 the depth of water had been increased to 20 feet. The eastern pier was 1,340 feet, and the western was 580 feet, in length. The author then alluded to the report submitted to the Harbour Trustees by Mr. Telford on the 5th of February, 1827, in which he recommended that the old and a proposed new channel of the river should be converted into floats, as well as to the opinions of several other engineers, including Mr. Jesse Hartley, who, in 1831, suggested that a new cut should be made for the river, which was to be "canalised" by the construction of a weir across the mouth, and that the town reach should be appropriated to a dock and half-tide basin. In the following year Mr. Hartley, in a further report, adhered generally to his former plan, but advised, in addition, the deepening of the harbour by dredging. Fortunately, in the author's opinion, the works for the "canalisation" of the river were not carried out. A new channel was, however, commenced in 1840, and completed in 1844, at an expense of £23,000. Its effect had been to lessen the risk to shipping, and, by giving a better direction and greater force to the outgoing current, to improve the navigation. In 1845 Mr. Rendel was consulted as to floating dock accommodation; and, under his direction, the construction of an entrance, with a double sill, was proceeded with as a preliminary step to the conversion either of the river, or of the town reach, into a float; but of this work the masonry alone was executed.

In his first report to the trustees in February, 1849, the author proposed the formation of a dock on the site of the town reach, or old bed of the river. It was subsequently determined to construct a dock and half-tide basin, of the respective areas of 11 acres and 2½ acres, with a lock entrance to the dock, 160 feet long and 56 feet wide, and an entrance to the half-tide basin 60 feet in width, having a depth of water over the sills, of 22 feet 6 inches, and 25 feet 6 inches at high water of ordinary spring tides. A small lock connected the Swansea canal with the float, and another, at the head of the float, communicated with the various works on the banks of the river above. A small dock leading from the float, with an extensive range of warehouses round its margin, was also constructed at the same time for the Duke of Beaufort. The works for the lock and float were commenced in November, 1849, and completed in

December, 1851; those for the half-tide basin were begun in 1856, and were finished early in 1861. The total cost of these works, exclusive of the quay walls, had amounted to £95,688. In addition, the lower portion of the river to the piers-heads was straightened, and both it and the new cut were deepened by dredging. By these means the depth of the entrance channel had been increased 4 feet since 1850. There was nothing peculiar in the construction of the works, but their execution was attended with some difficulty, as a large portion had to be performed by tide work, with as little interruption as possible to the trade of the port. The foundations varied from hard concreted gravel to soft sandy clay, extending to a considerable depth.

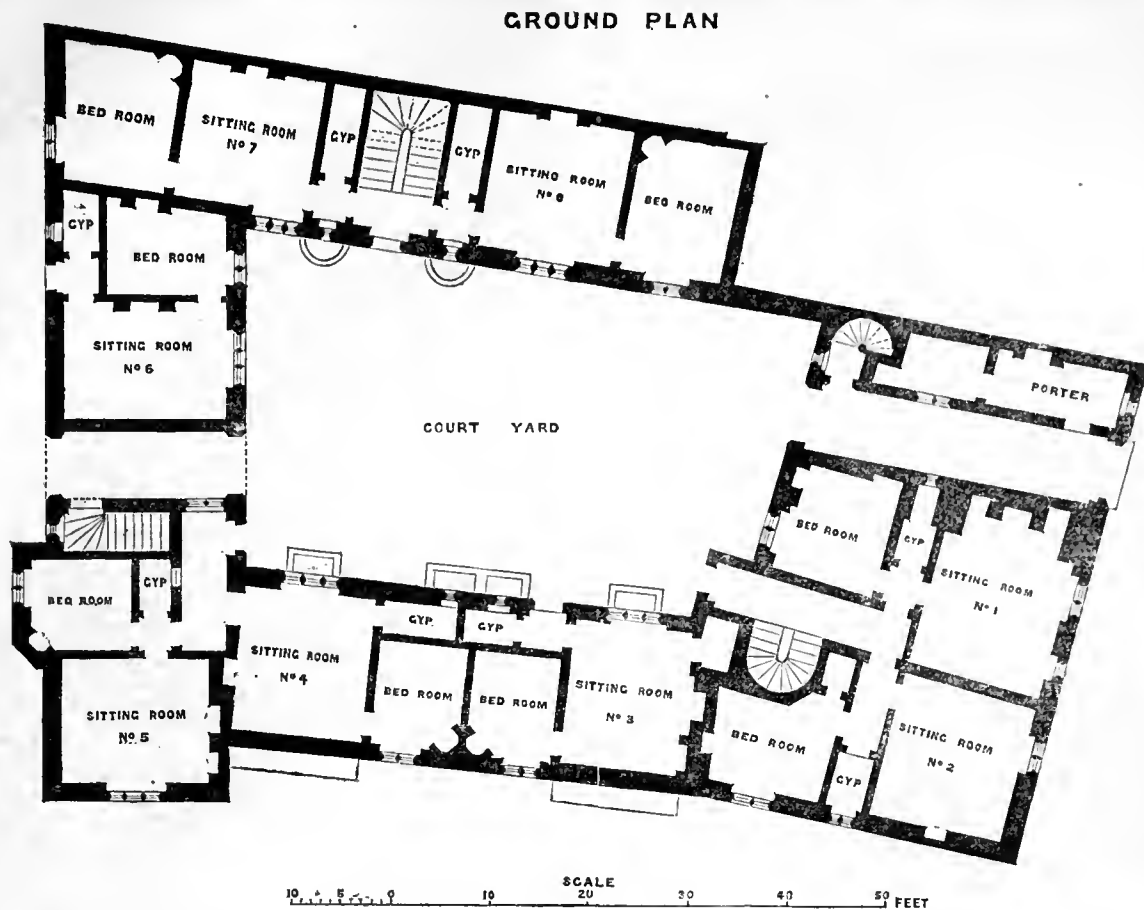

The most important work connected with the port of Swansea was the range of floating dock accommodation called the South Dock, which was formed on the foreshore of the sea beyond high-water mark. An Act was obtained, in 1847, for the construction of this dock, according to a design furnished by Mr. T. Page, M. Inst. C.E. In 1850 the author was requested to make the necessary plans for a trumpet-mouth entrance basin, having an area of 3 acres; for a half-tide, or outer dock, entrance, 70 feet in width, with a single pair of gates, having a depth of water over the sill of 24 feet; for a half-tide basin, or outer dock, containing an area of 4 acres, with a depth over the sill of 25 feet 6 inches; for an entrance lock, 300 feet long and 60 feet wide, divided by intermediate gates so as to form a greater or smaller lock, with an average depth over the inner sill of 22 feet 6 inches; and for a dock having an area of 13 acres, with a depth of 24 feet. Considerable progress had been made with these works, when they were suspended, in 1855, for want of funds. They were resumed in 1857, and were completed in 1859, at a total cost of £169,073. One of the first operations was the formation of an embankment to exclude the sea. Careful observations showed, that the main action of the sea and the set of the tides were to the eastward, towards the Mumbles headland. It was, therefore, decided to construct a series of timber groynes, at intervals of 1,500 feet, extending from the shore to the line of the proposed embankment. Rough boulder gravel, found immediately under the sand and the made ground, was tipped between the seaward-ends of the groynes, until a shingle beach, of great depth, was gradually formed, which served as a face to the embankment, and proved an effective barrier to the encroachments of the sea. The centre of the embankment was composed of the clay and peat found in the excavations, so that something like a puddle dyke was formed, and very ordinary means were sufficient to keep down the accumulation of water within the works. When the sea embankment had advanced some distance, the masonry of the dock walls was proceeded with. These walls consisted of rubble, with coursed rubble facework to a height of 2 feet below the general level of the surface of the water in the dock. They were faced in the upper part with ashlar, projecting 3 inches beyond the rubble facework. They were backed with the lightest and driest material that could be procured, in layers forming an angle from the wall, and rubble drains, with pipes for carrying off any spring, or upland waters, were placed at intervals in the walls. In no instance had any failure taken place, although the walls were subjected to a severe test; inasmuch as they were nearly completed when the works were suspended, and, on their resumption, the dock and outer basin were found to have become filled with water. Details were then given of the lock and entrance, from which it appeared that they were constructed, generally, with elliptical inverted arches of rubble, the quoins and floors, or platforms, being of sandstone ashlar, obtained from the coal measures in the neighbourhood. The pointed sill stones and the hollow quoins were of greenstone and syenite, from the Carling Nose and Barnton Mount Quarries, near Edinburgh. The sill stones were carefully toothed and bonded into the floor stones, so as to avoid a long straight joint. The recess and side walls were of rubble, with ashlar facework in the upper portion, similar to the dock walls, but the wing walls were faced throughout with ashlar. The filling and discharging culverts were of brickwork. The sluice frames and paddles were of cast-iron, faced with brass. In the lock and entrance gates, the heel mitre posts and the lower rib were of the best teak and English oak, and the ribs and planking were of pitch pine. Across the lock there was a swivel bridge, in one leaf, consisting of two wrought-iron tubular girders, with a superstructure fitted for railway or road traffic. There being no backwater, the waste from lockage was supplied by a steam centrifugal pumping-engine of 24 horse-power.

The successful application of hydraulic power for working the usual hand gear at the float lock, and at the lock at Newport dock, with much heavier gates, determined the author to adopt the same plan at the new dock entrance, as, in case of any accident happening to the hydraulic machinery, the usual means were then always available. As it was of the utmost importance, in the shipping of Welsh coal, that as little breakage as possible should take place, the hydraulic drops, or hoists, were so constructed as to deliver the coal into the hold of any class of vessel immediately at the hatchway; allowance being also made for the difference in size of the broad-gauge coal-waggons, the weight of which varied from 14 to 19 tons. The various machines employed for opening and shutting the gates, bridges, and sluices, for working the capstans, for discharging ballast, and for loading coal, as well as for the shipping and discharging of general cargoes, were upon Sir William Armstrong's hydraulic system, having accumulators equivalent to an effective pressure of 750 lbs. per square inch.

With respect to the work performed by the hydraulic machinery, and its cost, it seemed that, during the year ending October, 1860, the actual expenditure for engine power had been £22 16s. 1d. per week, or at the rate of 0.26 of a penny per cubic foot of water used for pressure. The cost of working was—by the cranes, 9-10ths; by the combined drop, 5-10ths; and by the waggon drops, 4-10ths of a penny per ton. But, inasmuch as the engine power was never fully employed, this statement must not be received as conclusive, as regarded the capabilities of the machinery. With the 80 horse-power steam-engine, it was believed that 100,000 cubic feet of water could be pumped per week, at a cost of £30, or at the rate of 0.072 of a penny per cubic foot of water; and that of this quantity 80,000 cubic feet would be available for working the cranes and the coal-drops, at a cost, for the hydraulic power alone, of about 1 farthing and 1-7th of a penny per ton respectively.

The commercial effect of the construction of the dock works and of the general improvement of the harbour was shown by the great increase in the tonnage of vessels frequenting the port. In 1851, on the completion of the first, or north dock, this amounted to 269,454 tons only. In 1860 it was 582,355 tons, and during the year 1861 the foreign tonnage had increased 10 per cent., and the trade was likely to extend, owing to improved communications with the steam-coal and the iron-producing districts, as well as with the heart of the kingdom.

* The substance of a paper read before the Institution of Civil Engineers, by Mr. JAMES ANERNEY, M. Inst. C.E., who stated that he proposed to give an account of the past and present history of these ports, so far as it possessed engineering interest, and to describe the works connected with them, rather with a view to the elucidation of general principles than of entering into matters of detail.

MASTER'S COURT, TRINITY COLLEGE, CAMBRIDGE.*

THE MEDÆVAL COURT AT THE GREAT EXHIBITION.†

OUR readers are aware that the Ecclesiological Society applied for a space in Class 30 of the Great Exhibition, to serve, in legal language, as a "conduct-pipe" for works of architects and artists friendly to the Society, and willing to join us in a united representation of our phase of art. This application was favourably entertained. At the same time, several other exhibitors, distinguished in various branches of mediæval art, religious and secular, had asked for and had obtained space in the same Class. The time drew nigh to map out the area among the different applicants, the immediate labour being divided between Mr. Waring, the superintendent of the Class, and a committee of exhibitors presided over by Mr. Craze. Observing, as they did, that we came forward in the character, so to speak, of super-exhibitors, within our own space, and that the works of the other mediæval exhibitors in the Class were homogeneous with our own, they proposed to us that we should take the control of the whole mediæval department within that Class, receiving and arranging a Mediæval Court; under the obligation, of course, to provide for the list of exhibitors who had already received their allotments. We did not hesitate at once to close with an offer made in so friendly and complimentary a manner, and so desirable for the objects which we had in view; while the exhibitors who were thus placed in correspondence with us most cheerfully acquiesced.

Accordingly, we are in possession of a court of 50 feet square, advantageously placed in the open space on the north side of the nave, and close to the eastern dome. Mr. Burges and Mr. Slater have agreed jointly to carry out the arrangement of it, and in their hands we are sure that it will be well done. We have no wish to forestall anticipation by a detailed catalogue of the Mediæval Court; but we may, in passing, mention that nearly all branches of ecclesiological art will be most satisfactorily represented. Sculpture will partly appear in completed works and partly in casts. We may note a reredos by Mr. Street, executed by Mr. Earp; and a portion of that for Waltham Abbey, designed by Mr. Burges, and executed by Mr. Nichol, with the cartoon of the rest. There is likewise a reredos, by Mr. Teulon, carved by Mr. Earp; and another by Mr. White, and a cast of the sculptures in the Bedminster reredos, sculptured by Mr. Farmer, under Mr. Norton's directions. Mr. Redfern contributes casts of his sculptures of the Ascension, for the Digby mortuary chapel at Sher-

borne, and for Mr. Slater's Westropp monument in Limerick Cathedral; the latter being arranged in connection with a portion of the actual carved work of the monument. Mr. White and Mr. Norton contribute fonts; and there will be a cast of the Renaissance font at Witley, which Mr. Forsyth carved for Mr. Dawkes.

Mr. Philip will contribute a cast of Dr. Mill's monument (designed by Mr. Scott) and effigy at Ely. Mr. Nichol will send another effigy, executed under Mr. Burges' eyes, and arranged on a high tomb in connection with some subjects in relief. Mr. Forsyth sends the late Lord Cawdor's high tomb, of which Mr. Nesfield was architect. Statuary by Mr. Farmer and Mr. Forsyth will also appear. Messrs. Clayton and Bell give one of the circular panels, with an incised subject, for the Lichfield pavement. In woodwork there will be the stalls of Chichester, carved by Mr. Forsyth from Mr. Slater's design; Mr. Burges' piquant painted furniture; Mr. Norman Shaw's rich bureau, executed by Mr. Forsyth, which was shown a year or two since at the Architectural Exhibition; and a decorated organ by Messrs. Prichard and Seddon.

Metal-work will be largely represented in contributions by Mr. Skidmore; and Mr. Street will send the iron font cover for St. James', Garden-street, by Mr. Leavers. The Ecclesiological Society will have the satisfaction of exhibiting the frontal which it presents to St. Paul's cathedral, designed, according to the "Cologne" method, by Mr. Bodley, and executed by Mr. Bell. The Dean of Peterborough has also most kindly lent the new frontal for his cathedral, executed by the Ladies' Ecclesiastical Embroidery Society; and the same Society sends a frontal for Clehonger church, designed by Mr. Preedy. The court will also contain hangings by Messrs. Jones and Willis, executed after Mr. Street's designs. The progress of Mediæval art-manufacture in general will also be illustrated from the firms of Messrs. Morris and Marshall, Harland and Fisher, and Hayward.

We might name other contributors, but we have enumerated enough to show that the schools of art, which in the Exhibition of 1851 were all but exclusively represented in Pugin's court, will now be taken up by independent hands, with the advantage of the schooling of eleven laborious and eventful years. But mediæval art is not confined to our own court. The National Committee for Architecture has also the control of a court for the exhibition of architectural art-manufactures, of all styles, situated on the east side of the south limb of the transepts, which project from the east dome, in which we are glad to say that Gothic art will not occupy an unobtrusive position. It will contain the marble pulpit for the nave of

* For View and Description see pages 328 and 329, Vol. VII.

† From the *Ecclesiologist* for April.

Westminster Abbey, designed by Mr. Scott, and executed by Mr. Field, which is to be offered as a tribute to Dean Trench's exertions in establishing the special services, and another marble pulpit by Mr. Street, executed by Mr. Earp. It will also comprise metal-work by Mr. Leavers, and a portion of the wall-space will be occupied by the prize subjects for this year of the Architectural Museum, out of which we may select the wood carvings and our own colour-prize panels for special praise. Across this south-east transept, and as if connecting that court with our own, will stretch the lofty metal choir screen, which Mr. Skidmore has executed for Hereford Cathedral, under Mr. Scott's directions. Mr. Hardman will also, we believe, be fully represented in the same portion of the building. In the galleries of the special Architectural Exhibition, comprising drawings and models, which abut on the north-east angle of the east dome, we have reason to think that the Gothic school will throw down the friendly gauntlet with spirit.

With regard to the controversy which they (foreigners) and we have equally for years been conducting with the classical schools, we are little in fear. Within the British side of the Exhibition building, by the free and ungrudging consent of all who are engaged in the work, this controversy has been one of perfect friendliness and mutual co-operation. Each school has striven to make the general success the greatest by doing most for its own cause, and cheering the other on to similar exertions. The verdict will be with the visitors, both public and critical. Of one thing for our own part we are certain, that Mediæval art, in all its varieties, will occupy a position very different from that of, and hardly to have been expected, in 1851.

STEWKLEY CHURCH, BUCKS.

MOST of your readers are probably acquainted with this interesting church, either from actual inspection or from the engraving of it given in Lysons. Its history is also well known as part of the history of art in this country. It is the sister church to Ilfley, built on the same plan, in the same style, and probably by the same architect, as both churches were given about the same time to the Priory of Kenilworth. Hitherto, for seven hundred years, Stewkley Church has been fortunate enough to escape any alteration, and it is, consequently, the most perfect example of a rich Norman church of the middle of the twelfth century that we have remaining in England. But, after escaping the perils of the Reformation in the sixteenth century, the great Rebellion of the Puritans in the seventeenth, and the ignorance and apathy of the churchwardens of the eighteenth, it is about to fall, in the nineteenth, under the hands of modern fashion, which has been more destructive to our old parish churches than all the others put together. The west end is to be pulled down, and the nave lengthened 15 feet, or one bay, on the pretext of making more room, but in reality to get rid of an ugly western gallery, which holds, in fact, more people than the proposed new bay of the nave will hold, and is nearer to the desk, the pulpit, and the altar. This gallery is to be got rid of as an eyesore, and in compliance with the well-known dictum, "that it is impossible to pray in a gallery." This dictum I believe to be absolutely false; as matter of fact, a person who is really disposed to pray will not be hindered from doing so by the accident whether he is placed in a gallery or on the floor. This dictum, then, is mere cant or affectation, and it has been, in practice, one of the most mischievous of all the dictations of modern fashion. The large gallery at Stewkley is an ugly thing which I should, abstractedly, be glad to see removed; but it is a mere piece of scaffolding, removable at any time when funds are forthcoming to build a chapel-of-ease, or school-room chapel, in another part of the parish, to hold the people now contained in the gallery, and the venerable structure would still remain intact.

The circular which is issued for the purpose of obtaining money under the pretext of accommodating a larger number of worshippers, states that the parish is 3 miles long, and the population 1,500, while the church accommodation is only 200. Surely this is a strong case for a chapel-of-ease, and not for a mere temporary makeshift, which would destroy the original plan and proportions of the old church for ever, whilst the next incumbent will still cry out for a chapel-of-ease. This gallery hides nothing but a part of the small west window, the head of which is seen above it, and a small part of the top of the two side doorways, which would be avoided altogether by raising the front of the gallery about a foot. It seems to me just a case where a mediæval architect would have shown his skill by making this useful gallery an ornamental feature. This was the great glory of the mediæval architects. They never shirked a difficulty, but made useful things ornamental also. The modern fashion of abusing all galleries appears to me to be carried to an absurd length. Galleries of several kinds were freely used in the Middle Ages, and were no disight to the building. The triforium gallery of Westminster Abbey is not an ugly feature, nor the Norman galleries across the ends of the transepts of Winchester Cathedral, which would be equally applicable for a western gallery. The Cathedral of Frankfort-on-the-Maine has galleries round three sides, part of the original design of the church, built of stone in the best period of Gothic art, always intended for worshippers, and still in use. The numerous roof-lofts in our parish churches in Somerset and Devon are not ugly features, and yet they are galleries to all intents and purposes: loft is only another name for gallery.

But I had almost forgotten another grave and serious objection to the western gallery at Stewkley. When people first come into the church they will not be able to see the new roof which is to be put on the nave, and in which the original high pitch is to be restored, in compliance with another modern prejudice. That the outer roof at Stewkley was high-pitched is plain enough from the weather-moulding remaining on the tower, but it by no means follows that the high roof was open to the rafters within. It is far more probable that the nave was originally covered by a flat ceiling, painted, in the style of the one we have remaining at Peterborough, and which Mr. Burges has had the spirit and good taste to adopt as his guide at Waltham, with remarkably good effect, as is generally acknowledged. That this was the usual covering of our Norman churches I have not the slightest doubt; it is the natural covering, and more consistent with that style than a high-pitched roof. In Italy, where the Roman style has never been discontinued, flat ceilings are almost universal; and although Peterborough is the only one that has escaped in this country, there is

every reason to believe it was the usual custom here also when the church was not vaulted.

There is an eastern gallery of the twelfth century remaining at Compton in Surrey, the front of which is engraved in the "Glossary of Architecture," and there are traces of similar galleries at the east end of several other Norman churches, as at Darent in Kent. This makes it evident that if the architects of those days had wanted a western gallery they would have built it, and have made it an ornamental feature. This is actually the case in many churches of the twelfth century in some parts of France, especially in Perigord, where the western stone gallery is the rule, rather than the exception, in small parish churches.

Another part of the plan proposed for Stewkley is to remove the "donkey-boxes," and restore the open seats, to which every man of any pretension to good taste or good feeling would wish God speed. The mischief that has been done to the Church of England by the introduction of this Puritanical innovation is incalculable. These high enclosed pews may be traced to the Presbyterians of Scotland, and to the time of the Great Rebellion. This hideous and most mischievous and un-Christian fashion followed chiefly the direct line from north to south, and reached across the Channel into Normandy and Piedmont; the eastern and western counties of England generally escaped the invasion of this plague, and for the most part still retain the fine old open seats which are peculiar to England, and are generally of about the time of the Reformation—some previous to it, others shortly after—and are the most fitting and the most ornamental furniture of God's house that has ever been invented. Those who have seen our genuine old English carved bench-ends in Somerset and Devon, Norfolk and Suffolk, will allow that it is impossible to praise them too warmly. But there is a modern prejudice against these also; nothing will go down now but moveable chairs, after the French fashion—the most ugly and inconvenient furniture for a church that ever was contrived. Those who have only a little knowledge of the Continent may admire the fine open space in the nave, when the chairs are all carefully stacked up to hide the windows of the aisles; but those who know the Continent well, and have had practical experience of the use of chairs, will be loud in condemning them. I should have thought that the English church in Paris was enough to satisfy any one of this. The miserable chairs standing at all sorts of angles, and with a second chair for each fine lady to kneel upon, which may be seen daily in most foreign churches, were found to take up so much room, that it became necessary to arrange them in rows, with deal boards nailed or tied to the back of them to keep them straight—as ugly and clumsy a contrivance as could well be imagined. Yet to comply with this new prejudice, modern architects commonly propose either at once to introduce chairs over the whole or part of the nave of a church, or, in order to lead the way to it, make their open benches as ugly and inconvenient as they can contrive, and put kneeling-boards to them, on which it is impossible to kneel for many minutes without serious pain. To my mind this interferes with prayer far more than galleries do.

Galleries were introduced into our churches in many instances by good and pious people as a makeshift,—an endeavour to remedy as well as they could the evils which had resulted from the system of enclosing the greater part of the floor of God's house with large square hideous boxes for the accommodation of the few rich at the expense of the many poor. By this system the poor were compelled either to remain ignorant heathens, or to become schismatics or heretics. To remedy this as far as possible, galleries were in many instances built for the poor, and we should hesitate before we remove them until we have supplied something better. Unfortunately, the time at which these galleries were generally erected was one of extremely bad taste and great ignorance of art, and consequently they are often as ugly as stupidity could make them; and sometimes they are quite useless. In all such cases let them be destroyed, whenever it is practicable, without causing a more permanent and serious injury to the fabric. But a gallery is a piece of furniture removable at any time, and in such cases as Stewkley it is better to endure it a little longer than do irreparable injury to an historical monument of importance.

If the fabric must be altered, the plan proposed may be the best that is practicable. It is intended that each stone of the west front shall be carefully marked, and replaced in the same position; and that the side windows shall be so scrupulously copied from the old ones, that in a few years' time no one can tell that the plan of the church has been altered at all. But this seems very like falsifying history. If a new west bay must be added, it would be more consistent with the professed object, and more truthful, to let it be designed and built at once of two stories, in the same manner as the domestic chapels and the almshouse chapels of the middle ages usually were, or as the transepts of large churches frequently were, and the west ends of churches in some districts (as already mentioned), and as they would have been in other places if the western gallery had been wanted. There is no occasion to go abroad for a model for this, it may be made thoroughly English. The manner in which some modern architects seize every opportunity to stick a bit of French, German, or Italian Gothic into our old English churches, makes it dangerous to refer to any foreign examples from which ideas might fairly be taken, if they would only be at the trouble of translating them into English, and making them assimilate with English art. One is continually reminded of that well-known vulgar bore in society, the man who has been abroad and knows a little of some foreign language, and who must be always displaying his little knowledge by interlarding his conversation with scraps of French, German, or Italian.

The incumbent of Stewkley is actuated by the best motives and intentions, and is very unwilling to disturb the fabric of his very remarkable old church, but the influence of modern fashion has been too strong for him; and, after some hesitation, he has yielded to its power. I hope it is not yet too late to make him see the barbarity of damaging an interesting page of the history of art in England, and feel that it is better to endure the eyesore of an ugly piece of scaffolding for a few years longer than to disturb the venerable fabric committed to his charge. The clergy are our natural conservators, and it is only since the spirit of change and innovation has reached them that so much irreparable mischief has been done.

JOHN HENRY PARKER, F.S.A.

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post*. Gold watches, 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enable persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 & 34, Ludgate-hill, 46 & 47, Cornhill, London, E.C. Established 1749.

NORTHERN ARCHITECTURAL ASSOCIATION.

THE annual meeting of the members of this Association was held in the Old Castle, Newcastle-on-Tyne, on Tuesday, the 25th ult. The President of the Society, Mr. DOBSON, took the chair.

A number of pencil drawings of architectural subjects and ornaments by Signor Bulletti, the Italian artist employed by the Duke of Northumberland in making the restorations at Alnwick Castle, were laid upon the table for inspection.

On the motion of Mr. DUNN it was agreed that the Secretary tender the thanks of the Society to the editor of the BUILDING NEWS for the presentation of copies of that Journal.

Letters were read relating to the scale of professional charges sanctioned by the Association from the Birmingham Architectural Society and the London Architectural Association, to whom copies of the scale had been sent, in order that they might express their opinion upon them. The Birmingham Society suggested several alterations, while the London Association declined to offer any opinion upon the matter, a course which did not appear to meet with the approval of those present.

On the motion of Mr. T. MOORE, seconded by Mr. WILSON, a vote of thanks was accorded to the Birmingham Society for their courtesy in the matter.

Mr. AUSTIN (who officiated as Secretary in the absence of Mr. Oliver) read the annual report, of which the following is a summary:—

In presenting the third annual report your Committee congratulate the Association on the increase of its members and the extension of its influence. During the past year the accession to the Association has been two members, viz., Mr. William Hill, of Leeds, architect, and Mr. Thomas Bryson, town surveyor, of Newcastle-on-Tyne; and four Associate Members, viz., Mr. Hudson Reah, of Sunderland, and Messrs. J. Bryson, H. J. Austin, and T. Mitchell, of Newcastle-on-Tyne. In the death of Mr. Richard Grainger your Committee have to regret the loss of an honorary member, whose energies and abilities in giving to the town of Newcastle a truly architectural character, procured for himself a world-wide reputation. The annual excursion meeting was held on the 28th of August, 1861, at Ushaw College, where, under the guidance of Vice-Principal Gillow, the members had an opportunity of examining the various interesting works of art and of science for which the college is so celebrated. After partaking of the hospitality of the college, the members proceeded to Durham, and examined the restorations of the central tower of the cathedral and other antiquities. In reviewing the proceedings of the Association during the past year, the Committee refer with satisfaction to the opportunity which the formation of this Association has afforded to its members of taking successful action in the formation of a local scale of professional charges, and in furthering the establishment of an architectural alliance; of aiding the proper representation of the profession in the International Exhibition of 1862; and of expressing their opinions upon the subject of professional examination as inaugurated by the Royal Institute of British Architects. The finances of the Association continue in a satisfactory condition.

Mr. T. MOORE (Vice-President) then briefly addressed the meeting, giving a review of building progress during the past year, in the course of which he referred to the edifices recently completed or in course of erection in the town.

Mr. WILSON then read a paper on sanitary matters, in which he said, "There has been important evidence of the general recognition of sanitary science as a vital branch of the architectural profession in the fact of the Royal Institute of British Architects having, this session, set apart an evening for the reading of a paper 'On the Essentials of a Healthy Home,' by Mr. Roberts; and a second evening for a discussion upon the same subject. As both paper and discussion were printed in the *Building News and Builder*, I will not refer to them more than to say in the course of his remarks Mr. Godwin gave to sanitary work a new distich—

"To drain and pave
Means raise and save."

The subject has been more painfully brought before the public in the fear that has been expressed that the loss the nation has sustained in the death of the Prince Consort was attributable to defective sanitary arrangements at Windsor. Mr. Rawlinson has expressed an opinion that Windsor Castle was the soundest and most complete house, in its sanitary arrangements, in this country. From Windsor, Mr. Rawlinson was to proceed to an examination of Buckingham Palace, prior to an inspection of the other royal residences. Her Majesty has thus set her seal to the momentousness of the sanitary question. Another important fact has still more recently transpired. Dr. Brady has obtained from the legislature a special committee to inquire into the applicability of the sewage of towns for agricultural purposes. This is a proceeding that will lead to many experiments, and elicit much new information. I would say a few more words on the primary importance of a salubrious site. In the case of cottages, particularly, we too often see the back-yard, or back garden, with the midden, privy, over-flowing water-butts, and pig-stye in it, higher than the basement of the house. No art can prevent such places from being constantly damp: nor the persons who inhabit them from inhaling an imperceptible, but pernicious vapour, drawn from the damp without by the heat within. The cottages of hinds are often built on slopes below or against the cattle-sheds, and close to stagnant ponds, &c. I lately inspected a row of cottages occupying this unenviable site. The back walls of the cottages formed the back walls of the cattle-sheds; close before the doors of the cottages stood the double pig-styes of the hinds; and at the end of the row was the green still pond. In this arrangement the cattle had the best of it, being on the ridge of the slope—the percolations from the sheds making their way to the lowest lying point, the pond, beneath the flagging of the hinds' cots. Within the latter, the rafters were uncased, but hidden with calico; and the imperfect thatching permitted the rain to trickle freely down the walls, and to drip heavily in large tears, in different places upon the floors. If, by any unfortunate chance, there is no choice of a better site than one in similar immediate contiguity to cattle sheds, the soil should be covered with concrete before cottages are built upon it. In model villages, too, I have seen great mistakes in the choice of sites. Landed proprietors, anxious to improve their cottage property, have obtained excellent designs from first-class men; but these have been placed in the hands of the surveyor to the estate for execution, and sanitary requirements in the matter of sites have been altogether overlooked. I expect that our esteemed member, Mr. Watson, who has turned his attention particularly to farm buildings, will agree with me that it is better to build on a ridge, bleak though it be, than to obtain a partial shelter from the wind by building at the foot of a slope on a site subject, by the laws of gravitation, to percolation from soil, sheds, byres, styes, or middens. Lastly, I would refer, with congratulation, to the fact that Newcastle, within the last few weeks, has also consented to consider sanitary progress momentous; for I learn, with satisfaction, that a proposal has been made to expend £50,000 to improve the condition of the town."

Some discussion was elicited by the paper, in the course of which

Mr. THOMPSON said it was a most extraordinary thing that Newcastle, which stood in such an excellent natural position, should not have a better system of drainage than it possessed.

The CHAIRMAN pointed out that there were a great many of what were called "pot holes" in the town, in which the water collected and stood. Though Newcastle appeared to be an exceedingly easy town to drain, from the cause he had mentioned it was most difficult to drain it properly. The Chairman drew a section of some of the localities in the town, in which the peculiar configuration of surface he had alluded to was presented.

The votes for the election of officers for the ensuing year were then taken, with the following results:—President, Mr. Dobson; vice-president, Mr. Walker; hon. treasurer, Mr. Dunn; hon. secretary, Mr. Oliver; committee, Messrs. Austin, Howison, Kyle, Moore, and Pritchett.

Mr. PRITCHETT, in reference to the proposed alliance of architectural associations, said that according to the outline scheme there should be a meeting next June, and the other associations were waiting for him to fix the day. He suggested the third Tuesday in June as the most eligible, and thought this meeting should appoint two delegates to represent it at the associated meeting to be held in London.

Mr. Pritchett and Mr. Austin were appointed delegates.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary general meeting of this body was held on Monday; WILLIAM TITE, Esq., M.P., the President of the Institute, in the chair.

Mr. T. HAYTER LEWIS, hon. sec., read the minutes of proceedings at the last meeting, which were approved of and confirmed.

Mr. JAMES HELL, hon. sec., announced several donations, and a vote of thanks to the donors was passed.

The CHAIRMAN said there were before the meeting a number of curious drawings, of which two were on the easel right and left of the chair, and two were on the table. Those drawings were made by a very distinguished antiquary, to whom he was introduced in very early life—he was, in fact, almost a boy at the time. His name was John Carter, certainly the father of all the architectural reminiscences and restorations which had led to such important results at the present time. He was *par excellence* the reviver, lover, and restorer of Gothic architecture—(Hear, hear.) He published two very curious books, one applying to the Gothic architecture of England, and the other on the sculpture of England. He was a very remarkable man, and a man of singular habits and tastes. When a youth he (the Chairman) was taken by a friend to see John Carter, who was employed by the Society of Antiquaries, and completed some series of their works. One series of drawings of York Minster was very large and complete, and he thought they were published by the Society of Antiquaries in their book called *Monumenta Etrusca*. One of the drawings showed Gothic architecture in its pristine excellence and beauty, and another showed Gothic architecture as struck down by the Reformation. Carter was an enthusiastic Roman Catholic. He was a very remarkable man, and the drawings exhibited that evening were very remarkable and beautiful drawings. He (the Chairman) thought it was forty years ago since he saw those same drawings in Carter's parlour. Carter was a most enthusiastic musician, and a most charming companion; he had no liking for publishers, and brought out one of his books without the intervention of any bookseller or publisher. One of his drawings was meant to represent the death of Richard II. At Brighton, the other day, he saw the four drawings referred to in the possession of Mr. Ambrassoni, of that town, and knowing them, asked that gentleman (whom he hoped was present) to be kind enough to send them there that night, so that those who were enthusiastic in Gothic architecture now might see what had been done in former days by John Carter—(Hear, hear.) He thought the four drawings were curious ones in the history of architecture, and was of opinion they would be found well worthy of their examination and of their appreciation.

Mr. M. DIGNY WYATT said he saw the drawings a few years ago in Bond-street, and he thought that if their funds were in a more flourishing condition it would be desirable to secure them so that they might be hung up on the walls of the Institute.

Mr. G. E. STREET suggested whether it would not be well to have a special subscription for the purpose of securing for the Institute possession of the drawings. It was a question whether they were not more indebted to Carter than to Pugin in reference to the revival of Gothic architecture. He thought it would be a very desirable thing for the Institute to secure possession of the drawings.

The CHAIRMAN said the money asked for the drawings by Mr. Ambrassoni was not very enormous or unreasonable. If it were the feeling of the meeting to leave it to the Council to purchase the drawings, he should be glad to lead a subscription for that purpose, as he thought the drawings were very elaborate and curious ones, and he should like to see them on the walls of the Institute. But whether they bought them or not, he was sure they were all very much obliged to Mr. Ambrassoni for sending them there that evening.—(Hear, hear.)

A MEMBER asked if the Council had received any communication respecting the proposal to lend the Soane Museum to the Great Exhibition. He had a copy of the Bill on the subject now before Parliament, from which he rather thought a question might arise, whether the lending of the collection to the Great Exhibition would not be virtually giving it to the South Kensington Museum. The Bill was encouraged and promoted by those who wished for the entire removal of the Soane Museum to South Kensington.

The CHAIRMAN said the matter was very easily explained, as he had the honour of being a trustee of the Soane Museum. A wish had been expressed to have all the works of Hogarth assembled together in the National Museum. Before he became a trustee, the trustees of the Soane Museum were asked to grant a loan of the Hogarth pictures there, and they said it was not in their power to part with those pictures, or, under any circumstances, to permit them to be removed. The Bill referred to was brought in for the nonce, and the object of that Bill, of which the trustees had no notice at all, was to transfer the pictures to the National Museum. He was quite sure the feeling of the trustees was not to let the Soane Museum be shifted by any side wind, or in any other way. He dared say the Bill would be read a first time in the morning, and if he were in the House he should take occasion to say that the trustees only meant to assist a great national object, a great national purpose, that of having assembled a complete collection of Hogarth's pictures. He should not forget the subject.

The *Leonine City*—Vatican.—The Rev. R. BURGESS, B.D., honorary

member, then read a paper entitled "On the Leonine City, Vatican," which was illustrated by a large map and some drawings.

The CHAIRMAN invited the remarks of gentlemen present on the very interesting paper which had been read. It was not possible to add anything to the information which the lecturer had given, but they might certainly desire to have his wish carried out in the fixing of a defined city for the Popes which he had pointed out, so that thus a *questio vexata* might be settled for the benefit of this generation and posterity. As to the masonry which had been referred to by the lecturer, he was always struck with the singular mechanical accuracy of the Roman buildings. In their masonry was uniformly found what architects called breaking joint accurately, and that was particularly the case with their brickwork. He never saw Roman brickwork in London, in England, or in Paris, in which that marked accuracy was not observed; that was the strict breaking of joint. Another peculiarity was the enormous thickness of the mortar-joint in brickwork, which was nearly as thick as the brick itself. There was connected with this matter a peculiarity of interest to architects and builders. If the bricks were good and the mortar good, nothing was so bad as the heedless way in which they were sometimes put together. It had always struck him that care should be taken in the workmanship, in placing bricks and jointing, to have them properly placed. As to the attacks upon Rome referred to by the lecturer, it was singular that both the great assaults, that made by Constable Bourbon and the late one of 1848, occurred pretty nearly at the same point. The attack made by the Constable Bourbon was well described by Guiccardini, and the account showed the barbarity with which Rome was attacked and sacked at that time. The assault on the city was made from the same side in both instances.

Mr. M. DIGBY WYATT referred to the connection between the Saxons and the city of Rome, and remarked that he thought anything which at all tended to illustrate the connection between Saxon pilgrims and the early Popes showed the natural process of the extension of the arts of ancient Rome by bringing a knowledge of them to the people of Northern Europe. He next referred to the great fresco at the old front of the basilica of St. Peter's, in which all architects must feel a profound interest. Of course they must remember the Lateran Palace was originally the great house of the Popes, after which the great work of the Vatican was commenced. Through the taste of the Medici and the Etruscan princes the foundation of the museum at the Vatican was laid. And they must all know that the Vatican Library contained treasures of art, beauty, illustrations of history and art, which was a great source from which fresh light might come to us of the history of men, of manners, of literature, and other things. He hoped that those treasures of art would be more freely unlocked. He was sure they were all much indebted to Mr. Burgess for his paper, and he proposed a vote of thanks to him.

The Rev. R. BURGESS, in acknowledging the compliment, suggested that Mr. Digby Wyatt should, on a future occasion, favour the Institute with a paper on the treasures of the Vatican.

The meeting then separated.

CAMBRIDGE ARCHITECTURAL SOCIETY.

THE fourth meeting of the session of the Cambridge Architectural Society was held on Thursday last, in the Philosophical Society rooms. C. C. COOPER, Esq., in the chair, when the Rev. G. Williams read Dr. Pierotti's paper on "The Tombs of Palestine."

The paper commenced with an explanation of Rachel's Tomb, of which a ground plan and other drawings were given. He entered fully into the question of its age and other particulars. He then spoke of the Mosque of Hebron, which is built over the Cave of Macphelah, and contains the tombs of Abraham and Sarah, of Isaac and Rebecca, and Jacob and Leah, and also a sarcophagus of Joseph, though Joseph was not buried there. He gave an account of his investigations concerning the subterranean caves, and explained how far he had been able to carry them on and the causes of difficulty connected with it. He then proceeded to speak of the tomb of Joseph, now held in great veneration both by the Jews and Moslems. After discussing the position, &c., of the tomb of Samuel, he spoke of the tomb of David on Mount Zion, and refuted the theory of David's sepulchre being the "Tomb of the Kings to the north of the city." He then gave an account of the Sepulchre of Our Lord, and traced the walls of the ancient city, showing how this was without the walls. He explained it with plans and sections of its present state, and its supposed original condition. He also entered into the question at issue between Mr. Fergusson and other antiquarians who have studied the topography of Jerusalem, explaining carefully the points of difference. After speaking of the tombs of Abraham, Jehoshaphat, Zachariah, &c., he concluded the paper with some general remarks on the subject, and said he was influenced in all his remarks by a desire to discover truth, and not to support one party or another who had written on the question.

After a pause, Mr. Williams rose to give an explanation of his views on the subject, and said that he hoped, eventually, he and Dr. Pierotti would agree more nearly, but he at present did not want to enter much into the controversy with him as he is going to publish his views, and he thought it better not to discuss the subject until he had done so.

MISSION CHURCH, WESTLEIGH MILL, LANCASHIRE.

THIS church, just erected under the auspices of the Vicar of Leigh, near Bolton-le-Moors, Lancashire, is intended to be used as a school during week days and as a mission church on Sundays. It comprises a nave, about 20 feet wide, of which only a portion is at present completed; transepts about 20 feet square, with boys' and girls' porches attached, and a chancel 30 feet by 20 feet. On the north side of the building are a small sacristy and a class-room or library.

The walls, both externally and internally, are of the red brick of the locality, relieved with bands, cornices, and alternated voussoirs of straw-coloured firebrick and blue headers, sparingly introduced. The roofs, which are open to the ridges internally, are covered with blue Bangor slates of the smallest size, into which are worked diaper and other patterns of green and purple Velineli slate, the ridges being of blue Staffordshire tile. All the works have been separately executed by local tradesmen, from the designs and under the direction of Messrs. Hayley and Son, architects, of Manchester.

INSTITUTION OF NAVAL ARCHITECTS.

AT the meeting of this Institution on the 27th ult., Captain FORD read a paper on the Manufacture of Iron Armour Plates, a portion of which (we have not space for the entire paper) may be usefully recorded in our pages.

The subject of the best method of manufacturing the armour plates was first brought under the consideration of the writer when the Thames Ironworks Company received the order for building the *Warrior*, and it became a question with the firm whether they should erect steam hammers for the purpose of forging, or increase the power of their mills for rolling the plates.

At that period, after careful consideration, the conclusion was adopted that the plan of hammering would produce the best results, and subsequent experience has, in the opinion of the writer, fully borne out that view.

Two qualities in the iron appear to be of prime necessity—toughness and solidity. If the iron is hard and brittle, it is easily cracked and broken by the shot; if unsound, either from blisters or lamination arising from imperfect welding, the power of resistance is proportionately diminished. It has been conclusively proved that any given thickness of iron, if composed of layers of thin plates, has very little resisting power in comparison with the same thickness of solid plate, and a plate apparently solid, but imperfectly welded, exhibits the same weakness.

The process of rolling plates $4\frac{1}{2}$ inches thick has been described by the head of the eminent firm of Messrs. Brown and Co., of Sheffield, in a paper read by him at the Institution of Mechanical Engineers, Birmingham, as follows:—

"Bars 12 inches broad, 1 inch thick, are first rolled; five of these are then piled and rolled into a rough slab; two of these slabs are rolled into a plate $1\frac{1}{2}$ inch thick; four of these plates are then piled and rolled into a plate $2\frac{1}{2}$ inches thick; and, finally, four of these $2\frac{1}{2}$ -inch plates are piled and rolled into the finished plate."

The hammered plates manufactured at the Thames Ironworks are made in the following manner:—Scrap iron of the best description is carefully selected and cleaned, piled, hammered into a bloom, and then rolled into bars 6 inches broad, 1 inch thick; these bars are cut up, piled, and again hammered into a slab; several of these slabs are put together, heated, and hammered to the form required, and this process being repeated, the plate goes on gradually increasing to the length required.

In the manufacture of the best hammered plates there is no mystery; it depends simply on the selection of the best material, and the employment of the most skilled and careful workmanship.

The writer confidently believes that scrap iron, rolled and hammered as before described, is decidedly the best material, and superior to any description of the puddled iron from which all the rolled plates are understood to be made. That the toughness of iron is dependent greatly upon the amount of working it undergoes cannot be doubted. This working has already been given to a great extent to scrap iron, and the process of rolling it into the 6-inch bars, which are the raw material of the future plate, gives it a degree of toughness and fibre which it appears to retain through all the subsequent heating and hammering.

The tendency of hammering to harden does not take away this toughness, and the process of annealing restores much of what is lost. Numerous experiments on single plates which have been fired at, and close observation in the drilling, planing, and bending of the large quantities of plates which have been hammered in this manner, have shown that the brittleness which has been attributed to hammered iron is entirely avoided, and that the toughness of the iron is superior to that of the best rolled plates which have hitherto been produced. Solidity and freedom from blisters or lamination is unquestionably more certain in the hammering process; and when it is considered that to produce a rolled plate sixty thicknesses of iron must be perfectly welded at every point throughout the finished plate, under penalty of there being lamination, the frequent occurrence of this evil would seem to be inevitable; the presence of dirt between any two layers, or the failure to reach a welding heat in any part of the centre of the large masses which have to be dealt with, being certain to produce this fatal result.

It must also be remembered that as the hammered plate is gradually built up of the slabs before described, a comparatively small portion of the mass requires to be placed in the furnace and heated at one time, while in the rolled plate the final pile, 10 inches in thickness, and weighing six or seven tons, must be brought to a welding heat at once, and the operation of welding completed before this heat is lost. To obtain this heat throughout the mass without burning the edges most exposed to the fire can hardly be counted upon as a uniform result, and when this has been accomplished, any delay in dragging it from the furnace, getting it to the rolls, forcing it between them, and completing the rolling process, will spoil it, and the loss, even of a few moments, may be fatal to the success of the operation.

These difficulties, of course, increase with the thickness and weight of the plates; the foregoing observations are made with reference to plates $4\frac{1}{2}$ inches thick; but when the thickness of the plates is increased to $5\frac{1}{2}$ inches, it may well be doubted if these difficulties can be successfully overcome in the rolling process.

The attempt has recently been made to effect a combination of the two processes of hammering and rolling; the slab, 10 inches, or thereabouts, in thickness, being forged under the hammer, then heated *en masse*, and rolled in the same manner as the pile, forming the final process described for the rolled plate. To this the writer objects that this plan involves the serious difficulties already adverted to as consequent on the heating and rolling of so large a mass. Thus far experiment confirms this opinion, as the plates manufactured in this manner have proved under trial greatly inferior both to the rolled plates and those hammered at the Thames Ironworks.

In the minor qualities of smoothness of surface and uniformity of thickness, it may be observed that the hammered plates are quite equal to the rolled, and, with respect to cost of production up to the thickness of $4\frac{1}{2}$ inches, the market price of hammered and rolled plates is the same; but, if the thickness and weight be increased, the cost of rolling will, without doubt, be seriously enhanced, while that of hammering will remain but little, if at all, altered.

NORTH OF IRELAND ARCHITECTURAL ASSOCIATION.—According to the *Dublin Builder* it is proposed to establish an institute, under the title of "The Ulster Architectural Association."

The *Engineer* notes that those taking an interest in the "smoke nuisance" question may now, almost any day, see the principal chimney of the Houses of Parliament belching forth dense volumes of smoke.

MISSION CHURCH, WESTLEIGH MILL, LANCASHIRE.—MESSRS. HATLEY AND SON, ARCHITECTS.

ON THE SEWERING OF TOWNS AND DRAINING OF HOUSES.*

THE first questions an engineer should ask himself with respect to any district or area to be sewered should be these—"How have surface waters passed off up to this time without the aid of sewers or drains? Have any surface impediments been formed; if so, what are the effects, and can such impediments be removed?" "Have houses been erected and cellars excavated in improper places, and where injurious flooding cannot be prevented excepting at a ruinous cost to the rate property of the district generally?" "Can water-courses in the valley lines be deepened at a moderate cost?" and, "Can embanking and pumping be resorted to economically?" "Are there any mills and mill-dams which impede drainage and cause injurious subsoil flooding regularly, and injurious flooding at intervals?" All these questions have a most important bearing on the dimensions of sewers.

It may look very egotistical, but I can better give an account of my own practice than that of any other person, and detail my own experience more confidently than stereotype it in tables, which must, in such form, be misleading and injurious.

Natural streams down valley lines should never be converted into sewers. The maximum flow of water in such streams is to the minimum as three hundred or four hundred to one.

Any sewer formed in such valley line of sufficient capacity to carry off flood waters, would be much larger than requisite for the ordinary flow, and would become a cause of nuisance in dry weather. All valley lines should be improved, and the beds of natural streams should be preserved free and open for the escape of surface and flood waters. Sewers and drains should be of sufficient capacity to remove roof, yard, street, soil, subsoil, and slop-water from the area drained during ordinary weather, and should be graduated to the amount of work to be done. Flood-water outlets or overflows into valley lines, or natural streams, to relieve the sewers during heavy rains, should be provided. There may be large gratings to remove surface storm waters at the outlet points of valley lines, but care must be taken not to make such places large stagnant cesspits.

All sewers and drains should be properly ventilated. This may be effected by connecting down-spouts with house-drains in proper situations; by connecting sewers with tall chimneys; or by providing, in the sewers and drains, ventilating shafts with charcoal filters for oxidising sewer gases. All sewers should have means of inspection, flushing, and cleansing provided.

Sewers should be laid out in straight lines, and with regular gradients. At each alternate change in direction, or alteration of gradient, a manhole or entrance to the sewer should be constructed.

Agricultural drain tiles are laid in straight lines. Ploughing, on the most approved plan, is also in straight lines. In both cases truth and efficiency of workmanship are attained, and straight sewers and drains insure good workmanship. One defective link breaks the chain; one defective pipe-joint or yard of sewer is injurious.

Brick sewers should be formed of radiated bricks, set in hydraulic mortar. Pipes should be jointed with clay puddle, or with cement or mortar, or asphalt, according to the nature of the ground in which the pipes are laid. Great care should be taken in laying pipes in rock, in gravel, and also in clay. Many lines of sewer pipes are injured by injudicious filling of a trench, or by a fall of clay or earth crushing the pipes.

The inlets of all drains should be properly protected, and the openings should be reduced so that any substance entering the drain may pass freely into the main sewer.

Where a sewer or drain has once choked, and the ground is opened out for repairs, do not close it in again, but construct a manhole or lamp-hole, that any future obstruction may be removed at once.

Sewers and drains act as subsoil drains to the full depth at which they are laid. In wet subsoils provisions should be made for allowing subsoil water to enter the sewers. A continuous flow of subsoil water along sewer or drain is generally an advantage, as the solids of sewage are more readily removed.

Nether sewers nor drains should be laid under new inhabited dwellings. If it be absolutely necessary to carry a drain under a house, the drain should be carefully laid, and the joints made perfectly tight, so as to prevent the escape of sewer gases into the adjoining subsoil.

Many lines of earthenware pipe sewers and drains are ruined when laid in porous subsoils with leaking joints. The fluid sewage leaks away, and leaves the solids to accumulate and ultimately to choke the sewer or drain, as the case may be. Puddle should be used in such cases.

All junctions with main sewers should be made at a point above the ordinary water-level in such sewers, and at the junction of branch or main sewers the top of the sewers should be on the same level. Additional fall should be given at junctions or bends, to overcome increased friction. Junction entrances, provided for branch sewers and house drainage, should be protected by earthenware plates, or "disc-plugs."

Street gullies should be small, compact, and double-trapped. There should be a sediment-box, easily removed and easily replaced. Means of flushing should be provided in the gully, that choking of the pipe connection with the sewer may be impossible. Large cesspit gullies are a nuisance. Small gullies of cast iron are generally found the cheapest and best; increase the number of small gullies rather than construct large cesspit gullies.

Fresh sewage, when properly diluted, filtered, or disinfected, may be passed into rivers, or into the sea, without causing nuisance or injury to fish. In arranging outlet sewers provision should be made for applying the sewage to land in the immediate neighbourhood for agricultural uses by gravitation if practicable. Pumping by steam or other power is available.

A town standing on ground having quick gradients requires special arrangements to break the rush of water down and of gases up. This can be done by breaking the line with a vertical fall, placing a flap over the mouth of the sewer, and ventilating at this point.

The outlet ends of all sewers should be protected with a covering flap, to prevent the wind blowing in and driving back sewage gases. A cast-iron pipe of comparatively small dimensions on any river outlet sewer will pass the dry weather flow of sewage to and below summer level of the river, so as not to be a nuisance.

The cost of town sewerage works is an important matter; and as continental governments look to England, and especially to the British metropolis, it is only right that they should have some sort of rule to judge by. In my experience I find that towns of and below 30,000 of population may have complete sewerage at or below one pound sterling per head. Where a population is compacted into a small area, and means of outlet are not distant, as in the cities on the Rhine, the estimate of one pound sterling may be relied on. But large brick sewers, for men to walk and work in, must not be constructed. The sewers must be of small sectional area, and so arranged that they may be cleansed absolutely and perfectly without sending men in and through them.

All rivers and streams are natural outlets for drainage, and since men have dwelt on the banks of rivers, surface refuse has been allowed to pass into and mingle with the waters. There is at present a great outcry against the pollution of rivers by sewers, and the killing of fish. The questions may be asked, "Whether is it better to pollute rivers, or towns and houses; to kill fish, or to kill men?" I do not advocate the pollution of rivers, but the application of sewage to land for agricultural uses. If it will not pay, in some cases, as a commercial speculation, make it compulsory, and pay the cost by rate. By far the most expensive process in any community is filth in cesspools beneath houses, or on the surface around human dwellings.

Proper sewers and drains deliver sewage at the outfall fresh, and in this state fish are not killed, but are fed. The putrid sewage flushed from the foul sewers of the metropolis during hot weather by a thunderstorm taints the river and poisons fish; but even in the hot summer of 1859 the mortality in London was low, although the Thames was foul. As cesspools have been abolished, the public health has improved; and if all the sewers were of sectional dimensions, forms, and gradients (as they may be) to transmit fresh sewage, and not retain it until putrefaction sets in, the public health would be further improved. It is practicable to so improve and manage the public sewers of this metropolis, that sewage one day old shall not remain, but shall be in motion towards some outlet; and in motion there is safety, but danger in stagnation.

* By Mr. ROBERT RAWLINSON, C.E., F.G.S. See page 221, ante.

The full and proper ventilation of sewers and drains is of the utmost importance; drains should be so laid and arranged as to render contamination of the air within houses (by sewage gases) impossible.

At present, the sewers of the metropolis, with exceptions in the City, as recorded by Dr. Letheby and Mr. Haywood, ventilate, for the most part, direct to the open air, by means of the vertical shaft from the crown of the sewer. The gases of decomposition rise direct out, and road dirt, stones, and grit fall in. The gases foul the air in the street, and the dirt, ground by traffic through the open grates blocks the invert of the sewers. The proper way to ventilate is to form a side-chamber, or side-shaft, and to place charcoal in the passage of communication from the vertical shaft by the side-chamber, so that all the gas escaping may be oxidised. The side-chamber receives the dirt falling through the ventilating-grate; it cannot enter the sewers. House-drains may also be ventilated in a similar manner.

Dr. Stenhouse pointed out the true uses of charcoal in 1853. I commenced the use of charcoal for sewer ventilation about the year 1858; and Dr. Letheby and Mr. Haywood commenced their elaborate and valuable experiments also in 1858.* I think I may claim to have been one of the first, if not absolutely the first, to apply the use of charcoal for disinfecting the sewage gases of an entire town, upon a general plan, as part of a sewerage system. I may instance Worksp, Buxton, and West Ham.

Cesspools may be ventilated through charcoal with advantage, where they cannot be abolished entirely, which is the only safe remedy. At the County Hospital, Winchester, a large cesspool, about 8 feet in diameter, is ventilated through a covering of charcoal. The arch covering of the cesspool was removed; a wire-work basket, supported on iron framework, covers the entire area of the cesspool, and this is filled with charcoal, broken fine (like peas), to a depth of twelve inches. There is a roof over the charcoal to prevent its being wetted by rain, and the whole is walled in so as to leave a clear passage round. It is reported to answer fully—there is certainly no nuisance from cesspool gases at this point.

The following are details of sewerage works executed:—

CARLISLE.

The "drainage area" of the district sewered is 1,930 statute acres. The main outlet sewer for the entire area is 3 feet 9 inches by 2 feet 6 inches. The sewer is laid with a gradient of 1 in 700. The outlet is extended to the centre of the river Eden, so as to deliver the sewage into the water of the river in the driest weather.

The main sewer, and the low-lying portions of the city, may be relieved by flood outlets, of the drainage of 1,930 statute acres.

The surface was most carefully considered, and all available means were used to prevent damage or inconvenience from local storms and flood-waters.

The main sewers and secondary branches are built of bricks, moulded to the sectional form required for each sewer, and set in engine-ground hydraulic mortar. Cast-iron pipes were used in crossing under rivers and watercourses, and for the main low-water outlet.

Flushing-valves or sluices are provided, and from a flushing-chamber in English-street (the highest part of the city), the sewers in twenty-eight streets in every direction may be flushed.

The sewers are designed to remove all sewage refuse without pumping. This will be accomplished completely at all ordinary times. An extraordinary flow may block the outlet, and a long-continued rain may then, for a short time, fill the lower sewers, simply because the surface waters impede all action; at such time the largest sewers would be filled, and, for a time, their delivery would be impeded. There have been heavy floods in the district since the completion of the works as any previously recorded, causing no injury to the sewers. There has been local flooding, but no one blames the sewers as the cause. The total cost was £23,310 6s. 7d.

Rateable value £60,378 7 9 } Annual rate in the pound required to repay principal and interest in thirty years, 6d.

Number of houses about 6,838 }
The cost of draining "self-contained houses, including one water-closet, was about £6 2 1
The same, without a water-closet, about 5 6 4
The cost of draining "tenement houses" with one water-closet for each house, taken on an average of seventy-one tenements, was, per tenement 1 6 7
The cost of draining "tenement houses" without water-closets, taken on an average of sixty-six tenements, was, per tenement 1 10 0

Where a water-closet has not been used, a cesspit has been drained, and the drain is laid at a greater depth, involving larger cost. Where a water-closet has been used, the cesspit has been filled up.

WORKSP.

The outlet-works consist of six trenches, about 200 feet long, three feet deep, and eighteen inches wide at the bottom, with side slopes of one to one. These trenches are provided with sluice arrangements at each end, to allow of the sewage being diverted as may be required, either for cleansing the trenches or for other purposes.

At the termination of the outlet-sewer provision has been made for passing limewater, or other disinfecting fluid, into the sewage, and moveable screens, for intercepting solid matter, have been placed in the trenches. Two outlets for filtered sewage-water are provided into the river Rytton.

The area sewered is about 400 statute acres.

The sewer from Bridge-street to opposite Beaver-place is of brick, egg-shaped, 2 ft. 3 in. by 1 ft. 6 in. At the termination of the brick sewer an overflow into the river Rytton is provided, and from this point to the outlet works the sewer is formed of 15-inch earthenware pipes, cast-iron pipes of the same diameter being laid across the river and mill stream. The outlet sewer has a fall of 1 in 600. This outlet serves for the entire district.

The sewers are formed principally of stoneware pipes of 15, 12, and 9 inches diameter, and the ventilating shafts are fitted with charcoal filters.

The site on which Worksp is built presents several natural and artificial difficulties to cheap sewerage works. The valley is flat and liable to rain-floods; the river had to be crossed several times, as also the canal on one side, and the canal feeder on the other. The outlet works are simple in plan and economical in cost. Expensive tanks have been avoided, and the cheapest, but most effectual, means for intercepting and removing any solid, flocculent, or discolouring matter have been adopted. The experience of two summers has shown that these works are efficient.

The proper place for liquid sewage, however, is the land, and the best filter is vegetable soil under full cultivation; but when the sewage is so used at Worksp, the existing outlet works will be necessary, as it is advisable to intercept any floating solids and to irrigate with the fluid above.

The entire of the sewage of Worksp may be carried on and over the land below the outlet works very cheaply, by contour conduits, and be distributed by surface irrigation. A small outlay on such works, and intelligent management in irrigating and growing appropriate grasses, will prove beneficial to the farmer.

The entire system of sewers in Worksp is fully ventilated by special arrangements for this purpose at 51 places, and these include all upper ends of sewers. The estimated cost of the works was £6,000; the actual cost, including all contingencies, was £5,871.

BUXTON.

Two outlets for sewage have been formed into the river Wye; one near Wye-bridge, and the other opposite Duke's-drive. The outlet sewers are so arranged with regard to levels as to allow of the whole of the sewage being applied, by gravitation, in irrigating the land in the valley of the Wye.

The district for sewerage purposes has been divided into two "drainage areas," the main sewer for each sub-district being formed of 15-inch stoneware pipes.

In many portions of the town the sewer excavations were made, wholly or partially, in limestone rock. In such cases the trenches were excavated six inches below the proposed level of the sewer, and a properly prepared bed was formed for the pipes by filling in the trench with clay, gravel, or sifted earth. Manholes and lamp-holes have been provided at all the changes of direction or alteration in gradient of the sewers. Flushing chambers

* See page 180, ante.

have been constructed at the upper ends of the sewers, and provision has also been made for flushing from the baths and from the river.

The sewers from "High Buxton" have gradients of about 1 in 10. Overflows into the river Wye, for relieving the sewers during heavy rains, have been formed at river crossings and other suitable points. Ample means have been provided for ventilating the sewers by about thirty shafts furnished with charcoal filters.

My estimate for the public sewerage works of the district was £3,203. The actual cost of the works as carried out was £3,107 ds. 10d.

ALNWICK.

The cost of house drainage works necessarily depends, in a great measure, upon the position of the premises drained with regard to the main sewer; the length of drains required, the depth at which they are laid, and the character of the subsoil.

The following particulars are given as the average cost of house drainage works in the towns named:—

Houses of £40 rental, with one watercloset, cost about	£15	3	3
Houses of £15 rental, with one watercloset, cost about	7	11	1
Houses of £7 rental, with one watercloset, cost about	5	4	4

The length of drain to each house in Alnwick, taken on an average of 516 houses, is 25½ yards.

WIGAN.

Mr. John Law Hunter, borough surveyor, has given me the following information as to drainage in Wigan:—

The average cost of draining cottages of about £3 or £4 rental, has been at an average of	£1	1	0
Ditto ditto £7 or £8 rental	1	11	0
Ditto ditto £14 or £15 rental	1	13	6

4,228 houses have been drained at a total cost of £8,796 19s. 10d., or an average cost per house of £2 1s. 4d.

In draining 4,228 houses, 36,960 lineal yards of earthenware pipes have been used, being an average of 8½ yards per house. The earthenware pipes used are from 9 inches to 4 inches internal diameter.

Many of the drains have been in use several years, and there have not been any complaints of choking or stoppages.

Waterclosets are not in general use in Wigan, but cesspits, yards, stables, and house sinks are drained. A general use of earthenware pipe drains prevents rats living in the sewers and drains. They have neither food nor means of shelter.

The author then gave a description of the sewerage works at West Ham, already noticed in the BUILDING NEWS.

The following list of loans, sanctioned under the Public Health Act (1848) and the Local Government Act (1858), will show to some extent the progress that has been made in carrying out sanitary works in England during the last twelve years:—

1850 15th June to 31st Decemb	£	41,665	0	0
1851 1st January to 31st Decemb	103,706	0	0	
1852 " " "	246,470	0	0	
1853 " " "	500,740	0	0	
1854 " " "	599,893	0	0	
1855 " " "	424,126	6	3	
1856 " " "	522,703	16	5	
1857 " " "	312,612	11	0	
1858 " " 1st September	204,261	13	0	

£2,956,178 6 8

Amount of loans sanctioned under the Local Government Act:—

1858, 1st September to 12th August, 1859	£260,905	13	0
1859, 12th August to 21st August, 1860	280,259	7	4
1860, 21st August to 1st August, 1861	356,192	0	0
1861, 1st August to 1st March, 1862	129,998	0	0

£1,027,355 0 4

£2,956,178 6 8

£1,027,355 0 4

£3,983,533 7 0

This amount has been borrowed by 178 towns or districts.

Improvement in social and in sanitary matters has made rapid progress of late. Within the last half century land drainage and town sewerage have ripened into sciences. From rude beginnings, insignificant in extent, and often injurious in their effects, they have become of the first importance. The introduction of machinery to make land drain pipes and town sewerage pipes, gave a forward movement to civilisation. Land, by judicious draining and improved cultivation, is frequently doubled in value, and town sewerage, with other social regulations, frequently prolong human life from 5 to 50 per cent. as compared with previous rates in the same districts, and, within my own knowledge, house property throughout a whole town is reputed to have been increased 25 per cent. in value by such works. Agues and typhoid fevers are reduced or entirely banished. John Howard, by his labours, has shown to the world what could be done for gnats and for criminals; Edwin Chadwick for town sewerage, and Florence Nightingale for camps, barracks, and hospitals.

With respect to the beneficial effects of sanitary measures, we may read the remarks by Sir G. C. Lewis, in moving the Army Estimates. He said, "There have been a large number of improvements introduced for the purpose of bettering the moral and sanitary condition of the private soldier. In the first place, there has been a great improvement in barracks; and I am happy to say that these improvements in barracks have not been unattended with important results. I will read for the Committee some statistical returns, which I believe to be authentic, and will show a marked improvement as regards the rate of mortality in the army. The returns are taken for two periods for an average of six years—1830-36, and 1854-60, giving the number per thousand. The annual mortality of the household cavalry from 1830 to 1836 was at the rate of 14 per 1,000; in the latter period it was only 5 per 1,000. In other cavalry it was at the first period 15 per 1,000; in the latter only 6 per 1,000. Royal Artillery, 15 per 1,000 in the first period; in the latter only 7 per 1,000. Foot guards, 21 per 1,000 in the former period; and only 9 in the latter. The infantry of the line, 17 per 1,000 in the former period; and only 8 per 1,000 in the latter. The returns for the Colonies, of all forces, for the same periods, showed that for the former—namely, from 1830 to 1836—the mortality at Gibraltar was 22 per 1,000; but in the latter period only 9. Malta showed a diminution from 18 to 14 per 1,000; Ionian Islands, from 27 to 9 per 1,000; Bermuda, 35 to 11 per 1,000; Canada, 20 to 10 per 1,000; Jamaica, from 128 to 17; Ceylon, from 74 to 27. These are great results, and they are owing to the changes made in the sanitary condition of the army."

Since the year 1840 great and beneficial sanitary improvements have been effected in English towns. An annual mortality of 44 in the 1,000 has been reduced to 27, and 30 to 20, and even as low as 15. Human life has more value in England than in any other country in the world, entirely due to better sanitary arrangements.

It has been said, "as are the people so will be the government," but my experience leads me to the conclusion that bad government necessarily makes a bad people. Temptation is the parent of vice, and opportunity the broad road leading to destruction. A little leaven of evil leavens the whole mass. Lord Shaftesbury, through the entire of his most valuable life, has appreciated the facts stated, and has devoted himself to teaching, by example and by precept, to preventing as well as to reforming. His "Common Lodging Houses Act" has probably done more good than any other law of modern times, by removing temptation, and, therefore, preventing evil. Before the passing of this act there was no check to vice in its most disgusting forms. I only indicate that which I have seen, and cannot, consistently with the decencies of society, openly describe. I can only say that our civilisation resembled those volcanic regions where the internal fires of destruction made the earth

tremble beneath the feet of the dwellers on the treacherous surface—a sudden outbreak might at any time take place, and overwhelm all in ruin.

Social improvement must begin in the upper circles of society, that it may descend in precept and be enforced by example. Our own good Queen Victoria understands this. The great and wise Prince we have recently lost, and whom we so deeply mourn, fully understood this. The deep-thinking, far-seeing ruler, who sits on the Imperial throne of France, appreciates the fact. In the International Exhibition of 1851 the model cottages of Prince Albert probably worked more human good, by encouraging home improvements, than all the glitter of precious stones, the wealth of jewellery, and the subtle refinements of art. The poor are utterly powerless to help themselves in matters of sanitary improvement. They cannot build their own houses, but must inhabit such as are provided by others. They cannot make the laws, neither can they administer such laws as are made. If the laws are wise they receive the benefits; if otherwise, they suffer. Social science, as it is termed, must be administered by the State, and this Lord Brougham fully understands. It will be an evil day for society when Government divests itself of all executive power in social and sanitary matters. Freedom is a glorious thing, but license to imitate and work evil against the general body of society for private gain, is neither a safe nor a desirable state of freedom. A state which can tolerate cesspools, beerhouses, gin palaces, and can license dancing saloons, must bear with vice, crime, lunacy, and pauperism in excess.

Wise imperial laws are required, and honest and intellectual administration nationally and locally to secure sanitary progress, and the greatest amount of political contentment, commercial prosperity, health and social comfort to a nation.

Some tables were given, containing details of cost and other particulars of several executed sewerage works; to these we must return at a future time.

ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting of this body was held at the Rooms, 9, Conduit-street, Regent-street, on Friday evening; Mr. A. W. BLOMFIELD, M.A., the President, in the chair.

Mr. ARTHUR SMITH, hon. secretary, read the minutes of proceedings at the last meeting, which were found correct and signed.

New Member.—Mr. FRANCIS SKIDMORE was elected a member of the Association.

Metal Work.—Mr. F. A. SKIDMORE, of Coventry, read a paper on Metal Work, which was illustrated by a great number of drawings and sketches. We shall, in a future number, give a full report of the lecture, with engravings of the illustrations, without which it would lose much of its value. Only the first portion of the paper was read on Friday evening, the remainder being reserved for a meeting to take place in May next, when the discussion upon the whole will take place. The lecturer, we may at present briefly state, dwelt on the antiquity of metal work in architectural productions, and, in proof thereof, made quotations from the Sacred Scriptures, referring particularly to the temple of Jerusalem. When architecture had a living naos of its own, gold and silver were used in it to an infinite extent. And there never was a period in the world's history in which metallic forms developed themselves as at the present day, as in the construction of bridges, vessels, &c. The lecturer proceeded to show how metal work might be made beautiful, and developed truthfully and usefully; and referred to the natural treatment of metal, drawing attention to the way in which this had been managed in various ages. He next spoke of casting and other modes of treating metal, and alluded to the extraordinary development of iron-work at the present day. In ancient times gold and silver were used in great abundance in the decoration of edifices, in which the most skilled artisans were employed, and many architectural forms were of metallic origin. There was nothing so capable of an endless variety of form as metal work. Then we ought to use the greatest thing given to this age—its metallic development. The era referred to by the lecturer were chiefly the Assyrian and Greek, and he announced that the concluding portion of his lecture would refer to the Celtic, Byzantine, and Mediaeval periods.

The CHAIRMAN announced that the second part of the lecture would be delivered on a future evening, of which due notice would be given in the professional papers.

A vote of thanks to Mr. Skidmore for his instructive and interesting paper closed the proceedings.

INSECURE SCAFFOLDING.—F. M. D., in a letter to a contemporary says—"I beg leave to draw your attention to the very dangerous mode taken now-a-days in the erection and securing of scaffolding used for building and other purposes. The accidents which have occurred by the fall of these erections have been very many. To enumerate even those I at present remember would trespass on your valuable space. Suffice it to say, that scarcely a week passes but we have some melancholy instance brought under our notice of the shameful manner in which these erections are constructed—dangerous, not only to the workmen employed on them, but also to any person who may chance to be near them. It is but a few weeks ago that a frightful accident occurred from the fall of a scaffold in St. Martin's Hall, when several workmen were killed and others hurt; and, again, more recently, a young lady, a visitor to her Majesty, nearly lost her life whilst passing along Piccadilly, through the same cause. I have no practical knowledge of such erections myself, and cannot, therefore, suggest a better mode of construction; but surely lives are not to be sacrificed every day in this way. Why should there not be a surveyor, whose duty it would be to see that the scaffolding is secure as well as the house? Really this is a subject some attention ought to be paid to; and, Sir, I know that when I ask you to take the matter up I leave it in good hands—hands which are ever ready to expose recklessness and point out error."

PAINTING IN THE HOUSES OF PARLIAMENT.—One of the votes to be taken when the House of Commons proceeds with the Civil Service Estimates is for the new Houses of Parliament, and includes a sum of £1,750, half the amount to be paid to Mr. D. Maclise, for a second wall-painting to be executed in the Royal Gallery. Of the two large compartments, one is now occupied by Mr. Maclise's "Meeting of Wellington and Blucher," already completed; and the other is to have the painting now to be begun, the subject of which is to be the "Death of Nelson." These paintings exceed 12 feet in height and 45 feet in width.

THE WINTER GARDEN AT KEW.—Progress is being made in the construction of the new house, and next autumn is to see the completion of the grand centre, 212 feet in length by 137 feet in breadth. Votes are now to be taken in the House of Commons, £3,000 for heating apparatus and £1,200 for walls for the arrangement of earth beds. When the two wings are built the total length (including the vestibules) will be 583 feet, and the superficies about an acre and three-quarters. This temperate-house makes the vote for Kew-gardens and grounds again large this year.

ON MOVABLE BRIDGES.*

THE subject of movable bridges is brought before this Institution, not because anything very new or original is to be introduced or explained; but it is presumed that it will not be uninteresting to glance at some of the prominent features of such bridges, at some of the improvements which have lately been made upon their construction, and at the merits of each kind of movable bridge in certain situations.

Under movable bridges may be classed draw or lift bridges, swing bridges, floating or pontoon bridges, and telescope bridges; but at present the subject shall be confined to draw and swing bridges, which are the only movable bridges adopted to any great extent in this country for permanent use.

At first, in crossing the ditches round fortresses, draw bridges consisted of a simple wooden platform, which was fastened at one end to a beam laid horizontally, and parallel to the sides of the opening to be crossed, or to the top of a stone wall or abutment by means of strong hinges. The platform was acted upon at its other extremity by levers, or by chains, worked either by wheels or by hand, and thus raised to the vertical position when necessary.

When ship canals were introduced into this country about a century ago, it was requisite to have movable bridges for all roads which crossed over the navigations. Draw bridges of a simple construction were often used for this purpose. The platform was generally divided into two equal parts, each revolving on a horizontal axis, and raised by means of chains passing over pulleys, which were wound up by wheel gearing. Afterwards the back-balance was added, and which is now one of the principal features of a draw bridge. The equilibrium being perfect, friction is the only thing to be overcome in raising or lowering the platforms, and this is generally effected by means of a pinion working into a circular rack, which is fixed to the sides of the bridge.

Draw bridges are also used for crossing locks and dock entrances at many of our harbours, and some of them are of considerable dimensions.

The abutments of these bridges are generally of masonry. The chambers or wells for the counter-balances are sometimes formed by inserting into the stonework of the abutments cast-iron boxes; but these wells can be made perfectly water-tight by ashlar masonry set in hydraulic mortar. The platforms were at first nearly always constructed of wood, and afterwards many were made of cast iron; but during the last ten or twelve years several large lift bridges have been constructed with wrought-iron girders and cross braces.

The draw bridges over the Forth and Clyde Canal, in number about forty, are from 20 to 22 feet in span between the faces of the abutments, and from 19 to 14 feet wide, the platform of each being in two leaves. The axles are of cast iron, with sockets in front, into which the timber joists are fitted, and with arms behind, to which the back-balance is fixed. The axles revolve on cast-iron bearings, and each half of the bridge is raised by means of the gearing shown in the drawing. The timber joists are covered by two layers of planking, and the sides are protected by wooden fences. These bridges are very easily worked by two men, one on each side of the canal.

The draw bridge at the London Commercial Docks is 48 feet span in the clear, and was erected from a design by Messrs. Walker and Burgess, in 1853. The platform is also in two parts, each having four wrought-iron girders 43½ feet long, firmly bound together by cross wrought-iron braces and ties. A cast-iron axle 12 inches square is firmly fixed to them, and revolves in plummer blocks provided with brass bushes. Kentledge boxes are fixed to the landward ends of the girders, and between them, for the counter-balance, which is 10 tons in weight, for each half of the bridge. The girders are covered with two layers of planking in the usual way, and the bridge is raised by the gearing at each side of each leaf, four men being required for opening the bridge.

Swing bridges are now extensively used at harbours, and for crossing inland navigations, both for roads and railways. The abutments are generally of masonry, but in many cases they are constructed of timber. The platforms of swing bridges, until lately, were usually of timber framing or of cast-iron girders, tied together and covered with planking. To the under side of the platform was fixed a cast-iron ring or roller path, and a similar ring was fixed to the abutment, the surfaces being inclined for the rollers. Between these rings were placed from ten to twenty conical rollers set in a cast-iron frame or live ring at equal distances. These rollers were generally from 6 to 18 inches in diameter, and from 6 to 12 inches broad. The concentricity of all the rings was preserved by means of a centre pin. The rollers were usually of chilled iron, but sometimes of brass, and on them the whole weight of the bridge was placed. The friction was thus considerable, and powerful gearing, worked by at least two men to each leaf, was required to open and shut all bridges, but those of the smallest and lightest description.

There are many fine examples of these bridges at our principal harbours, of large dimensions, and which reflect credit on their designers and constructors.

Swing bridges for roads were nearly always formed in two movable leaves; but when railways began to intersect the country, it was necessary to modify or improve such bridges, so that a rigid platform for the passing train could be obtained in crossing the numerous navigations, for which it was essential to have head-room for masted vessels. To get this rigidity, swing bridges of one leaf have been generally adopted, and these have been made either of cast or wrought iron. The bridge over the river Rother, on a branch of the South-Eastern Railway, is a good example of a cast-iron swing bridge, the girders of which are 112 feet long, each weighing 24 tons, and made up in four lengths.

The bridge near Falkirk, designed by Mr. A. J. Adie, for carrying the Stirlingshire Midland Junction Railway over the Forth and Clyde Canal, is an admirable example of a malleable iron swing bridge. In the former, the whole weight of the bridge is on sixteen conical rollers; in the latter, the greater part of the weight is on a steel ball, supported by a centre pivot; and the remainder of the weight is on conical rollers, with upper and under rings or roller paths. This bridge is easily worked by two men, and the platform is made rigid by means of four strong screws, which are turned by geared shafting. There is also a centre screw, by which the whole weight can be placed on the steel ball, and the platform adjusted. The ironwork and platform of this bridge cost about £1,000.

As in engine turn-tables, improvements have been introduced, which have simplified and cheapened the construction of swing bridges, and have rendered the working of them easy and expeditious. The recent improvements are—1st,

making the framework of wrought iron instead of cast iron, and thus reducing the weight of the platform, and correspondingly the back-balance. 2nd, putting the whole weight, or nearly the whole, on a centre pivot, capped with a steel ball, working into a steel socket. 3rd, having only four or six narrow rimmed wheels, with axles working in journals, and which are used merely to keep the platform horizontal, instead of a large number of conical rollers. By these and other minor improvements not only is the friction reduced to a minimum, but the construction is much simplified and cheapened, for the live roller frame and upper roller path are done away with altogether, and bridges of moderate size can easily be worked by one man.

A swing bridge into which these improvements have been introduced, has lately been erected from drawings made out by, and under the superintendence of, the author, for carrying the Twecher and Neilston Railway, belonging to Messrs. William Baird and Co., over the Forth and Clyde Canal, near Kilsyth. The clear span of this bridge is 25 feet, and the width of platforms 11 feet. The abutments are constructed of timber piles, tied and braced together and covered with planking. On the south abutment are fixed the centre pivot, and the casting or wheel-path, which is 11 feet in diameter. The moving platform consists of two wrought-iron girders, each 45 feet long by 2 feet in depth at the pivot, and 14 inches at the outer extremities. These girders are constructed of plates of angle irons riveted together in the usual manner. Over the pivot the girders are joined together by a strong cast-iron cross girder, made hollow at the centre to encompass the pivot. To the top of this cross girder, at the centre, is fitted a strong cap, into which a steel socket is fitted. This socket works on the steel ball, which is a hemisphere, 7 inches in diameter at the base; and the cap is fixed to the girder by six 1½-inch screw bolts, by means of which the bridge can be raised or lowered a little for adjustment, and by which the whole weight of the platform can be put on the pivot. The longitudinal girders are farther tied together by two cast-iron and three wrought-iron cross girders. To the ends of the cast-iron cross girders, along with the web of the longitudinal girders, the wheel bearings are fixed by screw bolts. The four wheels are of cast iron, 18 inches in diameter, with rounded tires 2 inches broad. The axles are of malleable iron 2½ inches in diameter, and revolve in journals placed close to the main girders. The bridge is covered with planking 4 inches thick, and the rails are laid upon the longitudinal timber beams, which rest on the planking right over the girders. The bridge is opened and closed by simple gearing: the lower pinion working into a circular rack, which is cast upon a part of the ring or wheel track. The ends of the girders swing over the abutment plates and about 1 inch clear of them; but to bring the platform to a solid bearing upon the plates, a wrought-iron wedge, 9 inches broad, which slides in a grooved frame, fixed to the bottom flange at the end of each girder, is driven tightly in between the girder and abutment plate by means of handles, levers, and connecting-rods; and by the insertion of the four wedges the platform is made perfectly rigid. The bridge has a self-acting catch or lock to fix it when either closed or opened. The back-balance weighs 13 tons, and consists of square blocks of cast iron, placed on the plates between the girders behind the pivot. A considerable mineral traffic has passed over this bridge during the last eighteen months, and it has been found to answer the purpose satisfactorily. It is easily opened or closed by one man in 60 or 70 seconds. The movable platform, including all the ironwork, cost about £300, and the abutments about £470.

It remains now to allude briefly to the advantages and disadvantages of draw and swing bridges in certain positions.

Draw bridges are very suitable for crossing the entrances and locks at harbours, where ground is limited and valuable, for all their parts are confined within the roadway, whereas in swing bridges when open, the platform covers ground or waterway of its own dimensions, which may not in many cases be easily given up for this purpose, as at the crowded docks of London. Draw bridges are, therefore, still being adopted there, for besides the large one erected at the Commercial Docks in 1853, already referred to, and which has since worked perfectly satisfactorily, another wrought-iron draw bridge, 34 feet span, has been opened for traffic two weeks ago by the same engineers at the same docks. A similar bridge was also erected over the harbour of Great Yarmouth, 50 feet span, in 1854.

Several cast-iron lift bridges were erected over the entrances to the Hull docks forty-five years ago, and are still in good working order. At many other places they have been adopted with advantage. Their adaptability to dock purposes is worthy of consideration by engineers, where a large portion of the traffic, as in London, consists of barges passing out and in, in which case it is only necessary to raise the bridge a little to allow the barge to pass; whereas in a swing bridge, the leaf would require to be turned nearly full round, occupying much time.

However, in many cases, draw bridges are now being superseded by swing bridges. The principal advantages of the latter are the simplicity of their construction, the working parts being all above the abutments, and readily got at, and consequently more easily kept in repair; and their suitability for railway purposes, for draw bridges being nearly always in two leaves, it is difficult to make them rigid enough for a passing train; and for roads over canals or other inland navigations they are not so convenient or so economically worked.

At present on inland navigations where draw bridges are in use, as on the Forth and Clyde canal, one permanent bridge keeper is sufficient for each bridge, the leaf on the towing-path side being raised by the horse driver; but when steam-power on canals becomes universal, as is likely to be the case, two bridge keepers will be needed to work each of the draw bridges, otherwise a man from the steamboat must leap ashore at every bridge for the purpose of raising one half of it; a practice which will both cause delay and be dangerous.

The equilibrium of a draw bridge is often interfered with by surface water running into the counterbalance wells, and by the wooden platforms becoming soaked with rain or dried by the sun's rays. In a swing bridge the exact equilibrium is not of so much consequence, for any small over-weight on one end is easily borne by the wheels.

It may, therefore, be expected that the day is not far distant when swing bridges will take the place of draw bridges on all inland navigations on which movable bridges are required; and even for harbours they are generally found to be better suited for crossing locks and entrances to docks and basins.

This subject has been brought forward so that the merits and demerits of swing and draw bridges may be considered and discussed, and not without the hope

* Read before the Institution of Engineers in Scotland, by Mr. D. McCALL.

that the engineering knowledge and skill of many of the members of this Institution may suggest to them improvements which may still further simplify and economise their construction.

In the course of the discussion which followed,

Dr. RANKINE said there was another class of bridges, on the telescope principle, of which he had seen no account published in detail. In 1847 he had examined one on the South Coast Railway, near Arundel, which worked satisfactorily. It was designed by the late Mr. Rastrick. The clear span of the bridge across the river Arun is 60 feet. The main platform, carrying a single track of rails, is 140 feet long and 15 feet broad, and is supported by suspension from a pair of timber trussed girders of the design shown in the figure. The whole of the timber framework is in scantlings of 1 foot by 1 foot, except the smaller uprights, which are 8 inches by 8 inches. Each of the four sloping tiebeams, by which the end of the platform are hung from the central standards, has a pair of flat wrought-iron bars running along its sides. These bars measure 3 inches by $\frac{1}{2}$ inch, and are the true ties, the timber beam serving only to stiffen them. In like manner, each of the smaller uprights, A, has alongside it a pair of iron strops, measuring 2 inches by $\frac{1}{2}$ inch, and these are the true suspending-pieces by which the platform is hung from the trusses, the timber uprights serving only to stiffen them. On the other side of the longitudinal timber sole-beams are a pair of inverted rails, which rest upon seven pair of wheels 5 feet in diameter. Those wheels are supported by fixed timber framework, not shown in the sketch. Under the centre line of the platform is a fixed longitudinal rack, teeth upwards, supported by a timber frame. Into that rack there gears a pinion on a transverse shaft, carried by a platform. That shaft is driven through two trains of wheelwork by two winches, one at each side of the middle of the platform. The side platform, for filling up the space between the main platform and the fixed track when the bridge is shut, is carried by ten wheels 3 feet 6 inches in diameter, which run upon fixed transverse rails. To the best of his remembrance it took two men about twenty minutes to open and shut the bridge. The framework appeared to him to have excess of strength, and consequently of weight, above what was necessary for safety.

RIPON DIOCESAN CHURCH BUILDING SOCIETY.

THE annual meeting of this Society was held on Thursday week, in the Town Hall, Richmond.

The EARL OF ZETLAND, who took the chair, said he was perfectly certain that the Church Building Society had already effected great good in the diocese of Ripon, and he trusted, from the accounts he had heard, that the Society was progressing, although it still required additional support to fulfil its legitimate purposes, and produce all the benefits which should be derived from it. As an instance of the benefit conferred by the Society his lordship mentioned that ninety-six grants had been made towards new churches, containing free sittings for 43,842 persons. The estimated cost of these new churches was 199,000, of which amount the Society had paid £31,798, and there was £2,215 yet to be paid. The Society had also effected an increase in the number of free sittings to the extent of 6,742, independent of those set apart in new churches which have been opened. He did not know the exact number of parsonage-houses which had been provided by the Society, but not less than £22,658 had been paid on that account.

The Rev. Canon CURT then read the report. The income during 1861 had been £2,219, or £78 below the average for the last twenty-one years. During the past year the legacy, left by Mr. Uppley, of £1,000, was received, and also one of £500; but, notwithstanding these considerable sums, it appears from the cash account that the charge on the income of the current year is no less than £4,661 9s. 10d.

Since the establishment of this Society in 1838 it has granted	
in donations for building new churches	£35,353
For restoring, improving, and enlarging old ones.....	6,266
For purchasing buildings for worship	500
For adding to poor endowments	13,460
For building parsonage houses	24,748

Total

£80,527

But the whole sum expended in carrying out these objects has been £403,130, so that no less than £322,603 has been raised chiefly by private charity. The result of this outlay appears in the form of ninety-nine new churches built, thirty-six enlarged or improved, upwards of 50,000 free sittings, besides children's seats, obtained, sixty-five poor benefices aided, and 127 parsonage houses erected.

MASTER'S COURT, TRINITY COLLEGE, CAMBRIDGE.

THE ground-plan, given on another page, will complete our illustrations of this building; a view appeared in our last volume. Mr. Salvin, as there mentioned, is the architect.

THE LATE FALL OF HOUSES AT HACKNEY.—The Metropolitan Board of Works have instituted an inquiry into the causes which led to the late fall of houses in Hackney, by which it will be remembered several lives were lost. Mr. Vulliamy, the superintending architect, has presented to that Board a report, in which he states:—"I have made inquiries into the circumstances of the case, and a personal survey of the buildings themselves. After giving careful attention to the several points for consideration, in order to determine, if possible, the cause of the failure in the stability of the buildings in question, I considered the effect to have been produced by several causes, viz., inattentive supervision on the part of the builder's foremen, and undue haste in executing works in such a critical situation. From the majority of the bricks used being of a very inferior description, and quite unfit for the purposes to which they were applied, the mortar also being of a very inferior sand and imperfectly mixed, from the incomplete state of the roofs at the time of the accident, and the want of a proper tie between the front and back walls at the level of the several floors and in the roof—the above-stated causes, combined with the vibration of the trains passing so constantly day and night, and acting upon hardly executed works, the brickwork being no doubt affected by the sudden changes of the temperature, and the scaffolds and roof being over-weighted with men and materials—all created a movement, and caused the front wall to bulge and fall."

THE CIVIL SERVICE ESTIMATES.

IN the House of Commons, on Monday, on the first vote of £33,503, for the maintenance of the royal palaces for one year.—Mr. Ewart suggested the removal of the pictures at Hampton Court to London, for greater safety and accessibility; and, in reply to a question, Mr. Cowper said that it was not the practice of the Government to insure any of its property, but special care was taken to prevent and extinguish fires. He also explained that the paintings were to be cleaned and varnished under the care of Mr. Redgrave, superintendent of the royal pictures; and the rest of the cartoons were to be enclosed with glass, as some of them had been. He agreed in what had been said respecting the bringing the cartoons to London; but this could not be done till there should be a building provided to put them in.—Mr. Coningham said that if the Royal Academy were removed from the National Gallery there would be plenty of room for national pictures. He was sorry to hear that more of the pictures were about to be put into the hands of the cleaners, seeing that they had so greatly injured those of the National Gallery on which they had been permitted to operate. He was convinced that art would be greatly advantaged by the abolition of picture cleaners.—The vote was agreed to.

On the vote of £89,510 for public buildings, Sir M. Peto drew attention to the enormous amount paid annually by way of rent for public buildings.—Mr. Cowper said the advantage of hiring buildings for public purposes was, that they were speedily available for use, and need not be occupied longer than was necessary.—Sir S. Northcote then inquired what steps would be taken to improve the fountains in Trafalgar-square?—Mr. Cowper, in answer, said he quite agreed that the fountains were such as Englishmen might well be ashamed of. At the same time, he ventured to say that by the month of May they would be such as every Englishman would be proud of. As the House had been good enough last year to vote a sum of money for increasing the supply of water, works were now in progress that would make them very ornamental and much to be admired. At present the water used in them, and which it was complained was charged with vapour immediately it came into contact with the air, was the hot water from the engines which was passed through the fountains for cooling purposes; but that arrangement was only temporary.—Mr. Hunt inquired why rent was being paid for the old Stationery Office when there was a new one now built?—Sir H. Willoughby complained that the New State Paper Office, which had been built at a cost of £40,000 or £50,000, was about to be pulled down.—Mr. Cowper said that he exceedingly deplored the necessity for pulling down the New State Paper Office. It unfortunately, however, stood upon a portion of the site which had been obtained at great expense for the New Foreign Office and India Office, and if it was allowed to remain would seriously injure the effect of the architectural elevations. Although it was true that it originally cost £40,000, it was not worth nearly that sum, as a very considerable expense was incurred in consequence of the foundations having been sunk in a troublesome quicksand. The new India Office was to be placed on the spot on which the State Paper Office had stood. The old Stationery Offices would be given up when their leases lapsed.—Sir H. Verney complained of the unsafe state of the houses in Chancery-lane in which the records were placed. One of them had fallen down a few weeks ago.—Sir M. Peto repeated his inquiry with respect to the desirability of erecting a building, modest in its elevation, which would accommodate the various offices which were now scattered throughout the west end of the metropolis, at an annual cost of £27,000; and Mr. S. Booth wished to know the intentions of the Government with respect to the houses in New-street, upon the owners of which they had served notices that their site would be required for the erection of the new Admiralty Offices?—Mr. Cowper said that the question of providing offices for the various commissions should have his best attention. He thought that probably a portion of the site in Downing-street might be appropriated to that purpose; and that the plan for the enlargement of the Admiralty Offices had not been abandoned, but had been postponed till next year. The plan had not been fully matured. With regard to the National Gallery, it was able to contain the pictures that were required to be put into it now; but he did not think the present building would suffice for long. When it was found that it was not spacious enough, some proposition would have to be made, but at present no proposition had been made.—The vote was then agreed to.

It was proposed that £86,664 should be voted for the Royal parks and pleasure grounds.—Mr. Ewart remarked that a certain portion of Hyde-park had been enclosed for the deputy ranger's cows, and when an opportunity occurred he trusted it would be thrown open to the public.—Mr. P. O'Brien reminded the house that they were asked to vote £7,000 for Battersea-park, which they were told was to pay itself. He wanted to know whether the charge was to be permanent?—Sir J. Shelley believed that the reason Battersea-park was not self-supporting was that the toll upon the bridge prevented people from building on the sites in the hands of the public. With regard to Hyde-park, he had endeavoured to persuade the Government to purify the Serpentine by pouring water from St. James's-park; but they thought right to dig a well instead. The well, he believed, was now dug, the fountains were erected, but no water was forthcoming.—Mr. Ayrton believed that the metropolis would have no objection to take over those parks, not royal parks, from the Government, and keep them up. If the Government handed them over to the municipality, they would be taken care of without any charge upon the national revenue.—Mr. Cowper thought the hon. gentleman was far from representing the feelings of the people of the metropolis. He (Mr. Cowper) should like to know what the hon. gentleman meant when he spoke of municipality? Did he mean the vestries? The question of a municipality was a sort of dream of the hon. gentleman. He fancied he was conjuring up something grand and noble in the name of a municipality, and he perhaps imagined that he was going to be the head of that municipality. Seriously, to invite the Government to give over these parks to the ratepayers, with a charge on the ratepayers, was, he ventured to think, a proposition that would not be ratified by the metropolis. There could be no doubt that these parks must be maintained, and he considered it was as well-spent money as any that they were accustomed to vote. They not only afforded enjoyment to numbers of persons coming from all parts of London, but he believed that the mortality of London would be greatly increased if they had not the parks. With regard to Battersea, he thought that, as soon as the great sewer, which was in progress, was completed, the land there would be taken for building on. It was not desirable that houses should be built until there was a proper main drain to carry off the refuse of any houses that might be built there.—The vote was agreed to.

ON LAND AND BUILDING SOCIETIES.

MR. W. CHAMBERS lately delivered an address before the Architectural Institute of Scotland, on "Land and Building Societies as conducted in England." The demands on our space from every quarter does not allow us to give the address in full; the material points, are, however, subjoined.

Mr. CHAMBERS said building societies began forty years ago in Scotland, and, spreading to England, became the subject of a statute, 6 and 7 William IV., cap. 32; but they were of little avail until freehold land societies were commenced about 16 years ago. The primary objects of these land societies was to buy freehold lands and retail them out in lots sufficient to confer a forty-shilling franchise; but this has, to all appearances, sunk into secondary importance. The land societies are registered under the same Act as the building societies, and are conducted on the principle of raising money by shares payable by instalments. Devoting their funds to the purchase of real or leasehold estate, they dispose of allotments to members at only a fair profit above cost price, receiving payments on certain convenient terms. As the two kinds of societies—land and building—act in unison, their operations for facilitating the purchase of houses by workmen have at length attained to the character of a stupendous system. In Birmingham the success of these societies is most marvellous. It appears there are now from 8,000 to 9,000 houses with gardens so allotted, and either already paid for, or in the course of being so. Fully 90 per cent. of the members of the Birmingham societies are mechanics, whose wages average from 21s. to 30s. weekly, out of which the annual average investment of each person is about £18. One group of societies with 6,000 members, receive in the aggregate £100,000 per annum; and another group, with from 3,500 to 4,000 members, receive in the aggregate not less than £50,000—total, £150,000—a surprisingly large sum to be collected in a few shillings a week from a body of workmen, and indicating the fervour with which they are generally animated. The houses are of brick, but neat and attractive, and are provided with gardens and all proper conveniences. The greater number of these dwellings are situated in the environs on land bought for the purpose. The question he (Mr. Chambers) had constantly before him was—what sort of a house can a workman with from 20s. to 30s. a week contrive to purchase? The result of his inquiry was to place beyond a doubt that many with wages of that amount have been able to become proprietors of very neat and comfortable dwellings. In none did he see any squalor or disorder, or what would be likely to injure health. On the contrary, the wish and the capacity to be cleanly and even tasteful were everywhere conspicuous.

On the subject of land and its prices, Mr. Chambers gave some facts.

The land, mostly freehold, is bought by land societies, and divided into allotments for members. The latest purchase was that of the Aston Park Estate, measuring 26 acres, which cost £23,000. It has a frontage of two miles, and is divided into 333 allotments, which have been taken up in a spirited manner. The strange thing is the comparatively high price of allotments. Prices vary, but it is not unusual to charge £40 to £50 for a piece of ground for a house and small garden. For example, it is seen by a list of prices that a lot consisting of 114 square yards cost £44, being at the rate of 7s. 8½d. per square yard, or £1,865 per acre. Some lots are as high as at the rate of £5,898 per acre. Compared with land sold near Edinburgh at £20 to £30 per acre, these prices are perfectly astounding, and conclusively demonstrate that it is not cheapness of land that produces the universal desire to be purchasers. The allotments are awarded to those who offer the highest premium, the amount of which, however, is restored if the mortgage is paid off within ten years. On procuring their title, members make their will, bequeathing their property to their families. For this purpose they fill in blank forms of will, kept at the office of the society; and simply effected, the thing costs them nothing. Ordinarily, the price of land and house, amounting from £120 to £180, but sometimes more, is paid up in from ten to fourteen years; the amount of the whole instalments being sometimes not more than would have had to be paid for rent to a landlord during that period. The whole cost of a title to a property is £1 18s. 6d.; and in the case of heirs, it requires no renewal. Many are able to pay up more promptly than others, not only from having better wages, but by having begun to deposit years before they required a house. Commencing to pay in from 2s. to 3s. a fortnight just when out of their apprenticeship, they in time accumulate a considerable sum; and when the period arrives for them to be married and begin housekeeping, they can almost liquidate one-half the price of a property. A comparatively small sum being thus to be borrowed from the society, the instalments to redeem the mortgage are speedily got rid of, and before middle life, when the burden of a family presses most severely, a man finds himself in the enviable position of being rent-free, besides having a property which he can bequeath to his wife and children. Inspired by the hope of realising a property, and so far securing independence, the workman scarcely needs any incentive to shrink from all kinds of expenditure not absolutely necessary. Old indulgences are relinquished, economic habits are formed, and devoting every spare sixpence to the liquidation of the debt on his property, he looks with absolute derision on the weakness of consuming even so much as a quart of beer in the public-house. Never was there such an auxiliary to the cause of temperance as these land and building societies. It can easily be supposed that with the prevalence of these sentiments, a very considerable improvement has taken place in the social aspects of Birmingham. For that town the land and building societies have done very much what the co-operative societies have effected for Rochdale. They have infused a higher tone among the general body of operatives. I have stated that this is essentially a movement of the working classes, who receive but very slight assistance from those who usually take a lead in public matters. The higher orders, however, who now understand and appreciate the nature of the societies, give them every sort of encouragement. Members of Parliament, magistrates, clergymen, merchants, and others—and I should not omit the esteemed Recorder of Birmingham—all give their approval, and frequently attend the soires and public meetings of the societies. In Wolverhampton, the busy seat of the iron trade, the working classes have been quite as eager in joining building societies as they are in Birmingham. I learned this morning that the land and building societies of Wolverhampton now number 4,794 members, have purchased 150 acres of land, made 1,343 allotments for houses, nearly 900 of which are built, and that their gross receipts up till this time amount to £173,989. In Coventry, with a population of ribbon-weavers, there was less expectation of success in these undertakings; but in that town also I saw many rows of dwellings which had been acquired by operatives. The progress of the societies had, however, been brought to a complete stop by the unforeseen and unfortunate dulness in the ribbon trade. Many of the operatives had sold their dwellings, and with the proceeds had gone off to a new field of exertion. In Manchester,

although the land is mostly leasehold, and held in perpetuity on paying chief rent, the land and building societies have been equally successful, and are, I believe, between forty and fifty in number. In Liverpool there are now more than 180 societies, but they are generally smaller than those in Birmingham and Manchester. In London, as is well known, there are numerous societies. Latterly these institutions have been introduced into South Wales, between which and the borders of Scotland there are now few towns without them. Throughout England and Wales there are said to be 2,000 land and building societies, comprehending more than 200,000 members. The money paid into the societies now amounts to above eleven millions, of which upwards of eight millions have been invested in property, part of the overplus having been repaid with interest. It will be understood that many calls have been made on account of want of employment, sickness, and death, removal, emigration, and other unforeseen events.

Having given a brief account of the land and building societies of England, and their generally beneficial influence, my occupation (continued Mr. Chambers) may be said to be at an end. I am not here for the purpose of arguing whether, in all circumstances, it would be preferable for workmen to rent, instead of buying houses, or whether in particular cases it might not be proper for associations of benevolently-disposed capitalists to get up houses for the working classes. My only object has been to make you acquainted with the remarkable fact that throughout a large part of England there has lately sprung up a practice among the operative body of providing houses for themselves. It will be observed that at Birmingham and elsewhere the question is not one of mere house accommodation. Something more is realised. The obligation, or it may be the fancy, to purchase a small and enduring property, obviously cultivates habits of prudent forethought and frugality, along with that sentiment of independence and self-respect which we can scarcely expect to see evoked under any plan of fostering benevolence. My wish, of course, would be to see the working classes of Scotland emulate their brethren in the south; nor do I know of anything that should seriously obstruct them. No doubt there exist some peculiar difficulties in the costliness and cumbersome of few charters, which we may hope in time to see cheapened and simplified. We are not, however, to forget that the substitution of an annual fee-duty of at most a few shillings for a payment outright of £40 to £50, is in itself an advantage to the less opulent classes. Our fee-duty, in fact, is only another name for chief or ground rent, such as is paid by large numbers in England who have built houses on leasehold property. Benefit building societies, which began in Scotland, now exist very generally in this country. Differing, it may be, in a few minor details from the English societies, they are registered under the same Act of Parliament, and enjoy the same immunities. Sometimes known as investment societies, all pursue the plan of advancing money on house property, and of taking payment by instalments to suit members. I am sorry that there are within my knowledge two instances of Scottish building societies having been broken up with loss on account of mismanagement; but, generally speaking, the institutions are conducted on a sound footing. In this city there are several societies of this kind, in which I believe every confidence may be placed. So far, then, there is already an effective mechanism for facilitating the purchase of houses; but, unfortunately, the members of our building societies are restricted in their operations by the want of land societies. Therein consists the weakness of the Scottish system. The advances of the building or investment societies are to a considerable extent on houses built it may be fifty or eighty years ago; prices are accordingly run up, property rises to a fictitious value, and the dearth of house accommodation is constantly increased. These societies must begin to see that, unless they widen their basis, so as in some measure to comprehend the qualities of a land society, they may easily become a public injury instead of a benefit. It would be foreign to the purport of this address to refer at any length to what we are all fully aware of—the lamentably defective house accommodation in the Old Town of Edinburgh, the condition of which, when compared with what I have described at Birmingham, might well stimulate the most lethargic. But, indeed, the state of this ancient city, with its foul and unwholesome dens,

"Where misery pours his hopeless groan,
And lonely wretches retire to die."

is to us all something of a misfortune and disgrace; and surely the time cannot be distant when, on public grounds, an effort will be made to render it fit for human residence. I should be glad if this were done in a manner to offering building ground at a reasonable price for workmen's houses; for the draining away of the more respectable operative body to the suburbs would only tend to the still further degradation of the city. That, however, is not a private but a public question, and as such it must be treated. Failing any speedy measure to clear the ground, the working classes, if earnestly disposed to follow the examples I have narrated, will look towards the environs, and, as in the case of the Co-operative Building Society, trust to themselves. Far be it from me to speak disrespectfully of the efforts of associated capitalists to meet the emergency, but independently of such endeavours being necessarily inadequate, I repeat that this is not alone a question of better house accommodation, but points to better habits and tastes, the self-respect and sense of responsibility incidental to the possession of property, and, in short, social and moral elevation. More I need not say. If the imperfect explanations I have offered chance to incite the working men of Edinburgh to follow in the footsteps of their English brethren, it will be to me, whatever it be to others, a matter of unspeakable satisfaction.

SIR JOHN SOANE'S MUSEUM BILL.

THIS bill has been read a second time without opposition.—Mr. Tite, in the House of Commons, consented, on the part of the trustees of the Museum, very unwillingly to the passing of this bill. Their only object in consenting was to lend to the National Exhibition the series of Hogarth's pictures in their possession, known as the "Rake's Progress," without which it was believed the collection of works by that admirable artist would be incomplete.

RE-OPENING OF THE SOANE MUSEUM.—On Wednesday the Soane Museum, at 13, Lincoln's-inn-fields, was opened to the public, and will continue open from ten to four o'clock every Wednesday, Thursday, and Friday, for such period as the Trustees may hereafter determine. In addition to the Museum being now open three days a week instead of two, as formerly, tickets of admission may be obtained with less formality, by all persons who may apply and enter their names in the book kept in the hall for that purpose.

CHURCH, CHAPEL, AND SCHOOL BUILDING.

Ketton.—A local journal says—The village church of St. Mary, at Ketton, near Stamford, was re-opened on Tuesday se'nnight. The cost of the work just completed is about £2,300. Owing to the want of more funds, the restoration has been confined to the nave, aisles, and transepts; but it is hoped that, at no distant day, the chancel will receive the attention it is so much in need of. Those familiar with the former neglected state of the church, and who had not seen the improvement effected until the opening day, must have been pleased with the metamorphose the interior has undergone. In the nave and aisles were square box pews, and there was an unsightly gallery at the west end. The last has been removed altogether, and inexpensive low seats, with open backs, have been introduced. All the floors have been taken up, and the surface lowered; and under the whole of the seating is a bed of concrete nine inches thick, with a hollow space of nearly a foot between this and the floors. The waistcoat pulpit is octagonal in form, and exhibits a good specimen of carving, by Irving, of Leicester. Each face of the pulpit is divided into two compartments, and in each division is a cross carved within a circle of nail-heads. The base of the pulpit consists of a central and eight smaller octagonal shafts, of Ketton stone, each capital having a band of nail-heads; the steps are of Mansfield red stone. The reading-desks and open seats in the choir were also carved at Leicester. The roofs have been entirely restored, of oak. The clerestory windows, arcade arches, basements, and the stonework generally, have been renovated. The basements of the pillars were much mutilated, the stone having been cut away to fit in the old high pews. In taking down the old fittings at the east end of the south aisle a portion of the old rood-screen was discovered, but none of the loft was left. Mr. Scott has directed the mediæval fragment to be restored and replaced where it was found. On removing the soil on the outside, the foundations and basement of the turret staircase that led to the rood-loft were found, and on the site another turret staircase, of Clipsham stone, has been erected to the belfry. A portion of the south wall has been rebuilt, and the parapet repaired; the window in the south transept has had cusping inserted; the window east of the porch has been restored, and that west of the porch has had new tracery inserted. The greater portion of the north wall has been rebuilt, retaining the old buttresses, north door, junks, &c. Two new windows have been inserted here, the same size as the former ones. The north parapet has been entirely renewed, excepting the lower course, which is the original corbel table restored. The earth has been removed from the foundation walls two feet below the floor line, and the footings underpinned. It was intended to extend the transepts north and south, and plans were prepared by Mr. Scott for this purpose, but sufficient funds could not be obtained to carry them to their original depth. The whole of the work has been carried out by Halliday, of Greetham, and Cave, of Oakham. The north and south aisles are lighted at the west end by lancets, filled with stained glass, each containing four pictures. One contains the figures of the four prophets, Isaiah, Jeremiah, Ezekiel, and Daniel; the other window contains the figures of the four evangelists, Matthew, Mark, Luke, and John. The designs for both windows were supplied by Mr. Sutton, as lately mentioned by us. As before stated, Mr. Scott is the architect.

Wickham, Hunts.—The parish church (St. Nicholas) of this village, which has long been in a state of decay and dilapidation, has just undergone repairs and restoration at a cost of nearly £1,500. The works were commenced in June last, and consisted of the rebuilding of the north transept, which was in an insecure condition, the substitution of new open timber roofs to nave and chancel, instead of the lath and plaster ceiling, the introduction of new stone windows in correspondence with the old throughout, and new seating of uniform design in place of the irregular pewing which formerly existed. Care has been taken to preserve intact every feature of interest, and in no way to seek to modernise the church. The walls throughout have been faced with "hopped" flints set in lias cement, with Bath stone dressings. New internal arches of Bath stone have been inserted to the north and south transepts, in lieu of plain semicircular plaster arches before existing, and a new chancel arch has been added, with shafts, bases, and carved capitals, representing the passion-flower, grapes, and wheat. There is a new pulpit of Bath stone, with serpentine marble shafts and glazed encaustic tiles. The chancel has been fitted up with plain stalls, and the vestry (formerly a chapel) has been separated from the chancel by an open parclose or screen. No decoration has been attempted in the chancel, the funds not allowing this to be done. It was not originally contemplated to interfere with a belfry at the west end, which was a modern structure. The weight, however, of the peal and the vibration attending the ringing had so seriously damaged this part of the work, that it was at length determined to take it down, and a small tower has been added at the west end, terminating in a wooden belfry stage and broach spire covered with shingles. Several memorial windows by Gibbs have been inserted in the church, and another is about to be placed in the east window. The works have been executed by Messrs. Chinnock, builders, of Highfield, Southampton, under the superintendence of Messrs. Francis, architects. The church was re-opened for divine worship on Tuesday the 25th ult.

Frome.—At a recent public vestry the vicar laid before the meeting the plans for the proposed restoration of the church, and entered at some length into the details. He said the object was to endeavour to restore the building as nearly as possible to its original state; and to effect this it was estimated that £4,000 would be required. Having nearly £2,400 in hand, it was proposed to proceed with the work at once, by commencing with the north side, the roof of which was not in a safe state. The organ would be removed to St. Andrew's Chapel, the west galleries removed, and the west window thrown open. The Lady Chapel, the property of Lord Cork, would be restored at the expense of his lordship and his family. To the vestry it was intended to add a vestibule. Eventually, it was hoped, the entire church would be commemorative of St. John the Baptist, it being intended to make all the windows illustrative of the saint's life. Six of the windows had already been promised. A resolution was adopted approving of the plans.

Sittingbourne.—For some time past it has been in contemplation to restore and improve the parish church, and a committee has now been formed for carrying out the work. A survey of the building was made some time since by Mr. Slater, architect, and it is proposed that the church be repewed, additional sittings made, new windows substituted for the present ones (some of which are in a very dilapidated state), and the building generally restored. The estimated cost of these improvements is upwards of £1,000.

Bollington, near Macclesfield.—It has been decided to erect a congregational chapel and schools in this place, designs for which have been prepared by Mr. Williamson, architect, of Bollington. The plan shows a chapel 57 feet 6 inches

by 36 feet, to accommodate, with gallery at one end, 480 persons. The school building is 52 feet 6 inches by 24 feet, in two stories, and is intended to be built so that whenever it may become desirable to extend the chapel, it will only be necessary to remove the partition wall to form commodious transepts thereto. The building has a tower and spire 80 feet high, the style adopted is early English. The estimated total cost is £1,800, all the stone being obtainable close to the intended site.

THE EXHIBITION BAZAAR.

A CONTEMPORARY says that the scheme of the Supplementary Exhibition has finally collapsed; but a more likely, though a less pretending enterprise has appeared in its room. Mr. Freaque, the owner of property abutting on the Exhibition-road, who conceived the idea of building a bazaar on the vacant ground, lost no time in carrying out his purpose; and a timber edifice lighted from the roof, as well as by side windows, is now nearly completed. M. Eugène Delessert, of Paris, decorator to the Emperor and Empress of the French, is the architect. The building is 400 feet long, 110 feet in width, and about 60 feet high. Persons who have been unable to obtain space in the larger building opposite, or who, having space allotted, may be desirous of selling articles of a similar description, can have space upon payment of a rental. A refreshment-room will be formed beneath the ground-floor.

THE WORKS AT WORCESTER CATHEDRAL.

WE have been asked to publish the following letters:—

Sir,—Our attention having been called to a tissue of unfair and untruthful remarks copied from the *Athenæum*, we respectfully request that you will find room for our reply. We are the contractors for the stonework in question, and we shall confine our remarks to those portions of the paragraph which refer to ourselves, leaving the rest to be answered by others, who also are unsparingly censured by this unscrupulous and anonymous writer. Having been extensively engaged in business for nearly thirty years, during which period, in addition to numerous private residences, we have been engaged under architects of acknowledged eminence in the erection and restoration of churches, colleges, and public schools, some of which are amongst the noblest in the midland counties, we might afford to bear with silent contempt the futile efforts of a scribbler, who, with a few dashes of his pen, seeks to rob us of our well-earned and highly-valued reputation; but these attacks from the London papers upon country workmen are now much too frequent to be allowed to pass by without a reply. To fair and candid criticism we hold ourselves at all times amenable, but we will not suffer any one, much less a writer who withholds his name, to traduce the character of our work, without our challenging him to make good his statements; and we now tell the writer of the paragraph that his remarks about the beautiful works filling up the spandrels having been retouched with a "ruthless chisel" is a gratuitous falsehood, inasmuch as these parts have only had the whitewash carefully taken off by competent persons. Some of the gildings and colourings are still visible. The new arcade under the east window has been executed in strict conformity with the style and character of the work. The carver and sculptor, Mr. R. Boulton—not Forsyth and Boulton—is a person of acknowledged ability, of which ample testimonials could be produced, if necessary; but on this head, perhaps, it will be sufficient to observe that, in addition to his works at Hereford and Lichfield Cathedrals, his sculpture has more than once been favourably spoken of by the *Art Journal* and *Building News*. We, too, have a cherished and reverential love for the beautiful forms which distinguish the best ages of Gothic architecture; and, feeling honoured by the task assigned us, which we have ever regarded as a labour of love, we respectfully submit to competent judges whether the work we have executed at Worcester Cathedral will not bear fair comparison with the ancient work. Had the writer's knowledge been equal to his ill-nature, he would have known that time alone can give to the oolite limestone that beautiful tint which is observable in the older carvings.

JAS. BENNETT AND SON.

Sir,—I trust you will allow me space for a few words on the subject of a paragraph which appeared in your paper last week. It is there stated, in speaking of the carvings of the spandrels in the arcade of the east end of Worcester Cathedral, that "they have been retouched with so ruthless a chisel, that all their former beauty of execution has been destroyed;" "as now mutilated, it is lamentable to see them; every sweet and thoughtful curve and delicate line of loving study has been scraped down to the poor form of a Birmingham metal casting. All richness of surface has, of course, vanished." As the sculptor and carver employed in the restoration alluded to, I beg to state that not one single portion of the old carving has been recut, or chiselled, or mutilated, in any way whatever, either by me or any person in my employment.

The accumulated whitewash only has been carefully removed. It is well known that oolite limestones, after having been quarried some months, and worked to a surface, become encrusted with a kind of hard skin on the surface—of a brownish colour. These old carvings are executed in Painswick oolite, and this brown skin or crust is still visible to any one who wishes truthfully to investigate the matter; even the old gilding and colouring in many places are to be seen. All the new work which I have executed there has been done in strict conformity with the style and character of the old, and has only been placed where the old had entirely disappeared, and under the strictest investigation of the architect.

I wish to say that I have executed sculpture for Hereford and Lichfield Cathedrals as well as Worcester, and also have works in hand for the same.

RICHARD BOULTON, Sculptor and Carver.

PRESERVATION OF PICTURES.—A contemporary says, some very simple but valuable practical hints for the preservation of pictures have recently been promulgated by the Belgian Minister of the Interior, and we commend them to the notice of the Commissioners of the International Exhibition, and others who may have the custody of valuable paintings. In the first place, the greatest enemy to pictures—damp—is referred to. In order to ward off its attacks it is recommended that "air should always be allowed to circulate behind the entire picture." In order to accomplish this a light framework of wood is to be placed at its back. The action of the sun upon paintings is rapid and fatal. This may be guarded against "by affixing blinds to those windows which are exposed to the sun's influence, or by covering the glass with a dead whitish colour." As far as possible, the placing of candles near pictures should be avoided, "the greasy smoke of the candles mingling with the dust and damp on the picture forms a glutinous matter which mars the beauty of the colouring." Other evils and accidents, too, arise from the proximity of lighted candles. "Dust and traces of damp should frequently be removed, and with extreme delicacy of touch." For this purpose it is best to employ an old linen rag or silk handkerchief. "Above all, the use of oil for giving a temporary brightness to the picture must be avoided." When this pernicious practice is followed the oil is absorbed by the colouring and the canvas or panel, and the picture will inevitably become blacker day by day. "In fact, nothing can be more disastrous in its effects than the use of oil in such cases."

Correspondence.

JOINERS IN LONDON AND LANCASHIRE.

SIR,—A few months back a large building firm in Lancashire advertised for a managing foreman, and I was selected to fill the situation, but after I had held it a few weeks I found the system, &c., so very inferior that I presented the following report, and was immediately requested to resign.

As it is a comparison between the London and Lancashire systems, and will explain the cause of a complaint made by Mr. Melley, the great promoter of drinking fountains and gymnasia, a short time back on the occasion of the opening of a gymnasium at Liverpool by Lord Stanley, to the effect that the joiners of the present day are not progressing with the age, I think you will find that the statements and remarks possess an interest worthy of your influential columns.

Liverpool, March, 1862.

COSMOPOLITAN.

* * * * * Omitting some few passages of a private nature, we give the communication referred to as sent to us.—ED.

* * * * * It is absolutely necessary that those who wish to trade successfully should have a thorough knowledge of the article they have to deal with. They should be well acquainted with its ingredients, more especially if it is labour, which is an article of the most dangerous description. Man constitutes the article labour, therefore those who deal in labour should thoroughly understand him. He may be said to be the best piece of mechanism from the hands of nature. The poet says, "An honest man's the noblest work of God." The part that makes him dangerous to deal in is his mind, as every other part is governed by it; hence employers of labour should always keep this important fact in view, and their object must be to employ the minds as well as the bodies of their men, for if the two are not employed simultaneously, neither will be employed profitably as far as labour is concerned. This being the case, a system which employs both must be superior to one that employs each separately. It is an undeniable fact that every man has a mind capable of expansion, and it is also an undeniable fact that education tends to expand it; therefore, as there are more facilities for education now than there were twenty or thirty years ago, it follows that the people are better educated and have larger minds, which consequently require more employment. It must, then, be admitted that a system which would answer twenty years since will not answer so well now; in fact, so great has been the change during these last thirty years, that a system which would be recognised then would not be tolerated in London now; but while the men have been almost metamorphosed, the systems in Liverpool have remained stationary. They are almost the same now as they were a quarter of a century back, as far as joiners are concerned. I might almost say that they are in direct opposition to the changes in other respects; for twenty years ago, when men's minds were less, they were better employed than they are now with larger minds. That is to say, the existence of minds in the men was more recognised then than it is now. When the mind of a man is employed about his work he does more, because he feels an interest in it, and the motions of his body are in keeping with the action of his mind—the former are urged on by the latter, the action of which is quick. Such a thing as loitering or skulking is unknown to it, and such a word as idleness cannot be found in its vocabulary. On the other hand, if the body is employed without it, or if the nature of the work ignores its existence nothing in the world will prevent the body from doing as little as it possibly can. The powers of the body are exhausted in half the time that they would be if the mind were employed upon the same object. If you give a man such work as will employ his mental and his physical machinery conjointly, you may leave him from "early morn till dewy eve" without the slightest alarm; but if the latter only is occupied upon the work you must not leave him an hour. Except during sleep, the former is never idle, and it follows that the latter must be the same when the same object occupies both at the same time; but where such is not the case the man is only kept to his work by the idea or the advice of the mind, which appears to be the body. "If you do not keep on with your work you will suffer some pain—you will get discharged, and suffer hunger, &c." In the case of the slave labour of the United States of America it would end by saying, "You will get the overseer's whip." The presence of some such fear as this is always necessary to keep him at work, for rest assured that when this fear ceases to exist his body ceases to labour.

The Lancashire systems appear to me to ignore the existence of mental faculties, in at least three-fourths of the men, whilst the cosmopolitan systems recognise in every man that noblest gift of nature to man. It is everywhere admitted that in that city may be found the greatest amount of talent and the first of systems. Properly speaking, there all joiners are considered equal, and one is never put over another, "gangers" are unknown, and the employer's aim is to create an interest in the mind of every man for his work, by giving him the alpha and omega of his job, for which he is responsible; that is to say, responsible for its being to the drawing with which he is provided by an efficient draughtsman. It is needless for me to say that they succeed, for they soon make a "man" a good workman. Many have I seen come into a shop who were unmistakably bad workmen, and go out first-class tradesmen, and intelligent men.

Now I come to a very grave part of my subject, which is, "the influence the occupation has upon the mind." It is everywhere admitted that it has a very great influence upon it—so great that it is second only to the schooling period of life. The trade which a youth has to learn, and the period of life in which he learns it, ought to be well considered by his parents, as well as by those who undertake to teach him that trade, for they also undertake to develop his mind. They ought not only to consider what sort of a workman they are going to turn out, but what sort of a man as well. To a very great extent it depends upon them what sort of a member of society he will be, and how he will act his part in the place of life. It is my painful duty to say that I can conceive no system more calculated to render an apprentice unprofitable to his master, imperfect in his trade, idle in his habits, and gorilla like in his mind, than that which appears to be recognised in Lancashire.

The writer proceeds to say, that with the view of introducing a system in the shops to enable his employers to secure and retain a better class of men than hitherto, and to ascertain the cost of producing work in detail, which would give a great advantage over contemporary builders:—

I should have made myself acquainted with what would be required first, and I will suppose that it was the first-pair floor windows for Mr. Brown's building, and that in the three fronts there were ten different widths. I should have made ten proper drawings, each of which would be a separate job, known by a fixed signal, viz., signal 1 would be six window fittings, 2 feet 6 inches wide; signal 2 would be four window fittings, 3 feet 3 inches wide, and so forth. The drawings for the ten jobs would then pass into the hands of the chalkline foreman, who would cut off every piece of wood required to complete the window fittings, including the frames, sashes, casings, and architraves. Every piece would be marked with its proper signal, so that mistakes were impossible. All the wood would then be placed in the stove, and after it had been there a week I should then set on ten pairs of men. To one pair and one boy I should give job 1, to another pair and a boy job 2, and so on. Everything possible I should have done in the shop, such as hanging the casements, fanlights, &c., and I should take care that every part and piece was marked with its proper signal.

Now, the work all being allotted out according to size in this manner, each man and boy would feel interested in his job, as there would not be that treadmill kind of monotony of planing-up stuff from 7 a.m. on Monday to 4 p.m. on Saturday, which kills man's spirits, destroys his intellect, and renders his life burdensome. Moreover, the foreman would have so many facilities for detecting idleness, inefficiency, and "scamping." Another important fact is that there would not be half the present waste of material. The cost per foot also could be speedily obtained, the most profitable and best men discovered, and the cost of any building, as far as labour is concerned, easily ascertained, and any loss could be instantly detected and rectified. A good basis, which might be depended upon, would likewise be established, and a great advantage obtained. A knowledge of drawing is now considered one of the principal branches of education, but twenty years ago it was considered a superfluity.

An argument will be that the 'jobbing' will frustrate the working of my system; but I can assure you that it does not, for I have seen it carried out in shops where quite as much

jobbing is done as you do here, and it is preferable on that account, as it is much better for a jobbing-hand to have a job of his own to fly to than to poke his assistance into another man's job—in which he feels no interest—and thereby lessen the interest the other man feels in it, to say nothing of the excuse it furnishes, for an undue length of time spent over it.

You will then urge that it is better, where there is a large quantity of the same description of work, that the whole should be done as one job, than to divide them into several jobs—that they will thus be executed at less per foot; but I give it as my decided opinion that, by the former system, the work will cost more per foot than by the latter system. I am acquainted with a man who made a four-pannelled door in 24 hours; but he could not make ninety-six like it in a month, twenty-four in a week, nor four in a day. I also know another that can make four pairs of sashes in a day; but he cannot make ninety-six pairs in a month, nor twenty-four pairs in a week. If that same man had a job consisting of four window fittings—that is to say, four sash-frames, four pairs of sashes, four sets of boxing shutters, and four sets of architraves, the four pairs of sashes would be made in a day; but if he had twenty-four pairs of sashes instead, with three or four men to assist him, those sashes would not be made in less than a fortnight; or, if he had twenty-four pairs to himself, they would not be made in less than nine or ten days, because of the monotony of the work. We will suppose that he was going to make four pairs in a day, and that it took him four hours to plane up the wood; is it at all likely that he will plane up the wood for ninety-six pairs in ninety-six hours, or for twenty-four pairs in twenty-four hours? No, it would be as reasonable to expect a prisoner to make the treadmill revolve as many times in a week as it does in a fortnight. To argue that five pairs of sashes will cost 3d. per foot, ten pairs 2d., twenty pairs 2d., and forty pairs 1d., is almost ridiculous, because, if you keep on at the same ratio, you can have 160 pairs made for 1d. per foot, and 320 made for nothing; and of course the men would give 1d. per foot to be allowed to make 640 pairs.

Perhaps the next argument will be that it is better to pass a great number through a machine when it is set than a few. To this I can only say that the saving effected in this way is so trifling that it is scarcely worth taking into consideration. The tools require sharpening every two doors and every four pairs of sashes, and the most modern and improved machinery is made so that it can be set with the greatest facility. The strongest argument, however, will be that the division of labour is universally recognised, which is true as regards a proper division. The only one recognised amongst joiners in London is preparers and fixers. The extensive division practised in Lancashire is a popular error which is rapidly dying out, and nothing has tended more towards the encouragement of the number of strikes which have taken place in this part of the country during these last few years. It has been the principal agent in destroying the good feeling which forty years ago existed between masters and workmen. At that period they felt that their interests were identical, and that they were bound to each other by other ties than £ s. d. I am happy to say that I believe that those good times are approaching again. The London builders are doing everything to restore that essential good feeling by founding institutions, establishing schools upon their premises for instructing the sons of the men in that which they consider the most important branch of their education, drawing, and by giving suppers, holidays, cricket matches, and donations to clubs.

One of the principal reasons why I consider the Lancashire divisions of labour an error is because it makes life, which loves variety, monotonous—converts human beings into machines. In our trade some would be sash-making machines, some doormaking machines, some shutter ditto, some casing ditto, and a great many poor fellows would be mere planing machines; but few, very few would ever have to put that sublime piece of machinery with which man is endowed by nature—the brain—into operation. The result is, that man abhors that which does not employ the mind as well as the body; he is reduced by it to the level of a lower animal, and, like the hounds in the hunt, they require the presence of a huntsman, whose duty it is to lash any lazy hound that lags behind. Men thus employed may be likened to a flock of sheep proceeding along a road, and the foreman to the dog that drives the sheep, for the moment the dog leaves off barking the sheep make a dead stop, and will not budge one inch till they hear his bark again. To get work done expeditiously you must create an interest in the man's mind for the work, or the job, and the London systems are in every way calculated to do that. Experience has taught us that men who are kept at monotonous labour never display any powers of invention, but men whose labour is various, ever changing, and thereby giving exercise to their mental faculties, which consequently become expanded, are the men who invent. If a man commences making sashes on the 1st of January, and keeps on till the 31st of December, it is questionable whether he would not be a worse sash maker when he left off than when he began, but it is quite certain that he would be no better, if he were so good, as a man who had at intervals during the year been making them twenty or thirty days. A boy at school who is kept at one particular branch of education will not master it so well as one who is kept at four or five branches.

We will, however, suppose that the occupation of the mind is not to be taken into consideration, and that a joiner, with his tools, is a planing, &c., machine. Can he not plane up wood as well for a sash as for a door? Can he not put his wood afterwards to the drawing and mark upon it the places where a mortice or a tenon, &c., is shown as well for a sash as for a door, for a skylight as for a shutter? My experience and careful observations answer yes.

The cosmopolitan definition of a joiner is a man who can produce in wood anything properly represented in a drawing. He can cut, shape, and form every detail to the shape, size, and proportions shown upon the drawings, and having done that he can put the whole in the relative positions shown upon the drawing, and having put his mental faculties into operation, and worked strictly to the drawing, the whole goes together as if it were a puzzle, and is a complete job, an harmonious whole. The man is delighted with the result of his labour, is a better workman afterwards, and his value to his employer is increased. From the moment he began that job to the instant he finished it, his whole soul and mind, as well as body, was intensely engaged upon it, and the silence of death is preserved in a shop where all are similarly employed. So intent is each one that the calls of nature are often unheeded, and "are you going to dinner mate?" "Is it so late as that?" "I didn't notice the bell," is often heard. Such a workman's life is one continual round of excitement. He does not count the minutes and think every one as long as an hour, nor does he, when he leaves, dread the resumption of his labour, and regard the workshop as a species of prison. He does not seek excitement, and muddle his brain with brutalising liquid at pouthouses. No, his whole soul is centred in his occupation, and he may be heard speaking of his achievements to his wife or his brothers. He will take her to the building on Sunday where the work is to be fixed, or when it is fixed he will point out his own productions with a feeling of exaltation. At eve, when he reaches his family he is not like an enraged tiger, and ill at ease with everything, and ready to curse his Maker; nor is he utterly worn out with the monotony of his labour. If he hears of other work and better pay he heeds it not, for it does not tempt him, for he feels wedded to his firm.

Now, I will trouble you with a few remarks upon the economy of space, and I have done. You will not deny that it is a subject worthy of consideration, in the centre of a town where every inch of space or ground ought to produce so much per annum. Such an important subject is this 'considered in London, that if a man were to keep his bench idle two and a half hours in the morning he would run serious risks of being dismissed. The Lancashire systems demand more space, and yet each man and each bench produces at least one-third less in the same amount of time than it does in London.

In conclusion, allow me to say that I cannot conceive a system more calculated to encourage strikes and advance the theories of the leaders of the unionists, than the one I complain of. They themselves could not possibly design better; but, on the other hand, the one I advocate is in every respect calculated to discourage these disastrous occurrences, and to frustrate many of the absurd theories of the unionists. The former enables them to do the least amount of work for the greatest amount of money. It places the masters wholly at their mercy, for if the "gangers" strike what use are the others? If the engine-driver ceases to work, what use is the engine? Mark the difference in the results of the London and the Lancashire strikes against the hour system. In the former it is firmly established, but in the latter, all hope of its establishment is banished. The difference in the systems alone account for this.

I have now stated the principal reasons why I consider that reform in labour, as far as regards joiners' work, is necessary in Lancashire.

In the course of these arguments I have spoken of ordinary men and boys, neither of which I have supposed to be above nor below the average in intellect. I have also used

the word system as regards Lancashire, more for the sake of brevity than anything else, because, strictly speaking, it is not a system at all. I might define it as an unsystematic confusion, or a combination of heterogeneous operations in which there is no rule, no check, nor anything positive or certain, but appears to be a reckless, hazardous, endless something leading to no reliable results. It may be described as a something which grasps at the shadow and loses the substance, and it resembles an army without discipline, a nation without laws, and a ship during a mutiny. Never was organisation more essentially necessary.

THE ALBERT OBELISK.

SIR.—It is not very easy to understand the reasoning of Mr. T. Roger Smith when he asserts the difference between a constructive and monolithic obelisk to be "the same in its nature as that between a plastic cast and a marble statue; between Portland stone and Portland cement."

Surely, if the material employed in a constructive and monolithic obelisk be the same, the one cannot be made, by any reasoning, a full size model of the other. It is not to be assumed that the designer of a constructive column will so use his material that any person viewing it will be deceived into believing it other than constructive. Thinking people, like Mr. Smith, would be horrified at such an exhibition of want of taste. But, on the other hand, the contemplation of a monolith, *per se*, can only be gratifying to the minds of the least educated portion of the public. Wonder would be excited, no doubt, but then it would be only that proverbially known as of nine days' duration, because the public prints will fully explain the means adapted for quarrying, carrying, and raising the monster, and with such means of estimating the value of the monument, the correlative will be, how in this age such a sacrifice, at the expense of judgment and taste, could have been made?

Of "sacrifice," I admit there would be more than enough, because the means, however large, must be limited; and if a large proportion be expended upon brute, or mechanical, force, there must be the less to spend upon educated taste.

The idea of a monolithic obelisk is essentially Egyptian, and it should not be forgotten that the Egyptian obelisks were always erected in pairs; and though it may be granted one of them formed an appropriate trophy when brought from its original site and erected by the conquerors of the land from whence it was removed, it was incomplete; and is anything but a fit model for our use.

Her Most Gracious Majesty may or may not have fixed notions thereon; and though to her expressed opinions we, as loyal subjects, should, doubtless, submit, I am convinced modern artists may be found who can produce a work that shall far transcend the Egyptian form, and that even without the sacrificial quality a monolith is assumed to express.

F. I. B. A.

TENDERS.

DWELLING-HOUSES, &c., TWICKENHAM.

For building eight small houses and doing sundry repairs to a house in Church-street, Twickenham, for Mr. George Scovell. Mr. Henry McCalla, C.E., architect.			
Todd	£2,800	James and Ashton	£1,493
Wright	1,934	Pugh and Wallis	1,425
Gydmann	1,925	Wingfield	1,250
Greenwood	1,760	Hill	1,162
London Building Company	1,500	Hill (without repairs)	1,082

CHURCH, STRETFORD.

For erecting the church of St. Humphrey de Trafford, at Stretford, near Man. E. Welby Pugin, architect.			
Easton	£5,650	Glaister	£4,770
Patterson	5,413	Simpson	4,502
Southend	5,040	Watts	4,350
<i>Presbytery.</i>			
Easton	£1,563	Glaister	£1,445
Patterson	1,095	Simpson	1,448
Southend	1,572	Watts	1,320

CONVENT, HEREFORD.

For the first portion of a new convent to be built at Hagley, near Hereford, for R. Bidolph Philipps, Esq. Mr. E. Welby Pugin, architect. Quantities supplied by Mr. M. S. Sharples.			
Simpson	£7,180	Smith	£6,435
Perkins	6,890	Houghton	6,275
Glaister	6,670		

SCHOOLS, ESSEX.

For new school-room for the Trustees of the Felstead Grammar School, at Felstead, Essex. Mr. Frederick Chancellor, architect, Pinner's Hall, Old Broad-street, London, and Chelmsford, Essex. Quantities supplied by Mr. Bartlett.			
Macey	£3,650	Emor	£3,220
Todd	3,357	Wood	3,073
Burrell	3,312	Palmer	2,763
Cushing	3,300	Rider	2,680
Corder	3,265	Brown	2,450

NEW BOW-BRIDGE, LEICESTER.

For the ironwork in the construction of the new bridge for the Highway and Sewerage Commissioners. Quantities supplied by the architect.			
Windsor Bridge Company	£828	Haywood	£555
Cochrayne	765	Pegg	420
Swingler	705	Pegg and Co	400
Stapp	643	Glasdon and Son	398
Handyside	630	Cliffe	392
Head and Company	600	Law and Sons (accepted)	360

BANK ALTERATIONS, STRATFORD.

The tender of Mr. Perry, builder, the Grove, Stratford, has been accepted for altering the premises on Stratford Broadway, for the branch bank of the London and County Banking Company. The front, we are informed, will be of white Suffolk malmes, with Portland stone dressings, and the bank will be opened for business on the 1st of May.

COMPETITIONS OPEN.

CHAPEL.

LEICESTER.—A premium of ten guineas is offered for the best design for a Wesleyan chapel, to be built in Leicester, capable of holding 900 persons. Architects wishing to compete may, upon application to Mr. H. Wale, 56, New-walk, Leicester, receive a plan of the site, and instructions and any other information required. The plans to be forwarded, carriage free, addressed to Mr. H. Wale, on or before the 1st May, accompanied with a sealed envelope, containing the architect's name, and bearing a motto corresponding with one to be placed on his design.

CONTRACTS OPEN.

BANK.

IRELAND.—For the erection of a bank house at Trim, for the Ulster Banking Company. Plans, &c., at Mr. W. G. Murray's office, 68, Lower Gardiner-street, Dublin. Tenders to be forwarded to the secretary of the Ulster Bank, Belfast, not later than 14th April.

CLUB HOUSE.

DUBLIN.—For intended alterations and additions to the Stephen's-green Club House,

according to plans and specifications prepared by John S. Butler, Esq., architect. To be inspected at his office, No. 16, Hume-street, Dublin, up to the 23rd of April, on which day proposals are to be furnished.

ASSEMBLY ROOMS.

STAFFORDSHIRE.—For the erection of the Silverdale Assembly-rooms. Drawings, &c., at the Silverdale offices, Newcastle-under-Lyne, size of room 60 feet by 38 feet. Tenders post-paid, to the secretary, on or before the 21st April, 1862, sealed and endorsed "Tender for Assembly-room."

ALMSHOUSES, &c.

KENT.—For the erection of thirty almshouses and a chapel for 240 persons, for the trustees of the Faversham Charities. Plans, &c., at the office of B. A. C. Erring, Esq., 1, Danes Inn, Strand, London; or also at the office of the architects, Messrs. Hooker and Wheeler, Breckley, Kent, from whom further information may be obtained. Sealed tenders to the office of Francis F. Giraud, clerk to the Trustees, South House, Faversham, on or before 10th April.

WORKHOUSE.

BIRKENHEAD.—For the erection and completion of the New Union Workhouse to be built at Higher Tranmer, Cheshire. Separate and distinct tenders will be required to be delivered for the building of the Receiving and Vagrant Wards, and also for the completion of the cellage under the main building. Drawing, &c., at the office of Mr. Thomas Layland, architect, 20, Castle-street, Liverpool. Sealed tenders to be delivered to Peter Gregory, clerk to the Guardians of the Birkenhead Union, 60, Lord-street, Birkenhead, endorsed "Tender for Workhouse," on or before the 12th April.

OFFICES.

STAFFORDSHIRE.—For the erection of offices in Queen-street, Newcastle-under-Lyne, for Mr. W. H. Dutton. Plans, &c., at the office of the said W. H. Dutton. Tenders to be delivered there on or before the 11th April.

BRIDGES.

SURREY.—For the erection of Flanchford bridge, over the river Mole, on the road from Reigate to Leigh. Plan, &c., at the office of Mr. Grantham, 7, Great Scotland-yard, London, S.W.; and at Mr. John Lee's, Reigate, Surrey; and the tenders, forms of which can be had, must be sent to Mr. Lee's office on or before April 11.

CHURCHES.

READING.—For the carpenter's and tiler's work to the roof of the Grey-friar's Church, Reading, and for the plumber's work, gutters, water-pipes, and for the drainage. Drawings, &c., with Ponton and Woolman, architects, 1, Grey-friars-road, Reading. Tenders to be delivered to the architects on April 14th, at 12 o'clock.

PARSONAGE.

SURREY.—For the erection of a parsonage, at Thursley, Surrey. Plans, &c., on application to the Rev. H. Branker, Thursley, near Godalming, Surrey, or to Mr. J. W. Pinfold, architect, 2, Charlotte-row, Mansion-house, E.C., of whom the quantities may be obtained, price 15s. each. Tenders (on a printed form), to be sent on or before 12th April, to the Rev. Henry Branker.

SCHOOLS, &c.

NORTHAMPTON.—For the erection of a school-house and residence, at Northampton. Plans, &c., at the office of the secretary, Mr. Fulford Vicary, at the Factory, Northampton. Sealed tenders, endorsed "Tender for Northampton School," to be sent to the secretary, on or before the 16th April.

DWELLING HOUSES, &c.

KENT.—For the performance of certain alterations and additions, including the erection of a new shop front, Bank-street, Maidstone. Plans, &c., with Mr. Henry Blandford, architect, Maidstone. Tenders sealed and endorsed "Tenders for Works," to Mr. Corke, on or before April 14th.

IRELAND.—For the erection of a dwelling-house, near the town of Bawnboy, co. of Cavan, according to plans and specification at the office of Mr. William Doolin, building surveyor, 27, Talbot-street, Dublin (where detailed bills of quantities may be obtained) up to the 14th April, when the proposals are to be forwarded, sealed and prepaid, to Mr. William Hague, Jun., architect, Cavan.

FARM BUILDINGS.

CUPAR FIFE (N.B.).—For the several works required in erecting and finishing a farm standing at Todhall, near Cupar Fife, the property of G. C. Cheape, Esq., of Strathgrym. Plans, &c., with Mr. J. Hall, 90, South-street, St. Andrew's; and tenders must be lodged with Stuart Grace, Esq., writer, St. Andrew's, on or before the 12th April. Contractors may offer for the whole works (which are extensive), or for any portion thereof. If the former, the sums for the different departments must be stated separately.

SALOP.—For the erection of a farm-house, farm buildings, and three cottages, at Walton, near Much Wenlock, in the county of Salop, for the Right Hon. Lord Forester. Plans, &c., with Mr. Robert Griffiths, architect, Bridgport, until the 19th April, on which day tenders must be delivered to the architect by 12 o'clock. Persons intending to tender to send their names either to the architect, or to his lordship's agent, William Thursfield, Esq., Barrow, near Broseley, Salop, so that a time may be appointed for viewing the site and plans.

RAILWAY WORKS.

LEVEN AND EAST OF FIFE RAILWAY.—For the construction of the extension of the East of Fife Railway, from the Kilmouchar Station to the town of Anstruther, either as a whole or in the following sections:—1. The Elie Contract, extending from the commencement of the extension near Kilmouchar Station to a point near Ardross Farm-house, and to about 4,325 yards in length. 2. The St. Monan's Contract, extending from the termination of Contract No. 1 to a point near the west boundary of the parish of Pittenweem, and to about 3,109 yards in length. 3. The Pittenweem Contract, extending from the point where Contract No. 2 terminates, to a point near the milestone at the west end of Anstruther-Wester, and to about 3,750 yards in length. The rails, chairs, sleepers, keys, and spikes will be furnished by the Company. Plans, &c., with the Secretary of the Company, at Leven, and the line is duly marked and staked out for inspection. Sealed tenders, either for the whole work or for one or more of the separate sections, distinguished by a marking on the envelope, must be lodged with the Secretary of the Company on or before 16th April.

MORAYSHIRE RAILWAY.—For the following contracts in connection with the Craigellachie Junction:—1st. Embankment Contract, commencing from Peg 0, at the Craigellachie Passenger Platform, and extending to Peg 33, being a length of 726 yards, or thereby, and comprising earthwork, fencing, permanent way-laying, ballasting, &c. 2nd. Spey Viaduct Contract, consisting of cast-iron cylindrical foundations, masonry, piers, and abutments, for one span of 200 feet, and three spans of 57 feet. The rails, sleepers, fangspikes, fishes, and bolts, will be supplied by the Railway Company. Drawings, &c., at the secretary's office, Elgin, from whom duplicate schedules and specifications may be obtained at 10s. each. The line is staked out at distances of every 66 feet. Sealed tenders addressed to the secretary, and marked "Tender for Embankment Contract," or "Tender for Spey Contract," as the case may be, must be lodged at his office on or before the 11th April, at noon.

CALEDONIAN RAILWAY.—For the construction of the Stonehouse Branch, about 4 miles 38 chains in length. Plans, &c., at the office, in Glasgow, of Mr. George Graham, the Company's engineer, where duplicate schedules and blank forms of tender may be had, price one guinea. An assistant engineer will attend at Stonehouse, on Friday, the 11th, at 12 o'clock, to accompany any intending offerers over the line. Sealed tenders, addressed to the secretary, at Glasgow, must be lodged with him on or before 28th April.

CAISSON.

FALMOUTH.—For the construction and delivery of a wrought-iron Caisson, for No. 2, Graving dock, Falmouth. Drawings, &c., at the offices of the Docks Company, at Falmouth, or of James Abernethy, Esq., M.P.C.E., 3, Parliament-street, Westminster. A printed form of tender will be supplied, which must be filled in and delivered at the offices of the Company, on or before the 18th April.

CHAMBERS' WORK ON CIVIL ARCHITECTURE.

SUBSCRIBERS to the BUILDING NEWS are requested to apply, by letter only, to our publisher, who will forward to them, free of charge, the remainder of the "Chambers' Supplement," with index and title-page.

THE ESTATE OF THE ROYAL COMMISSIONERS FOR THE EXHIBITION OF 1851.

THE disproportion between projected plans and what is actually accomplished is everywhere written on the pages of history. Nations and rulers from time to time essay great things. Seldom is it that they are not forced in the end to content themselves with a mere fraction of what they desired, and ruefully to count the cost at which that medium even has been obtained. There are few men of middle age but

will confess that the realisation of their pet schemes has fallen lamentably below the height to which their sanguine hopes once ardently soared. Not only is this the experience of individuals in the narrow details of private life, but, more strikingly so, of those who would fain have elevated the people, but have found that their words have been wasted on cold and inattentive hearers. Non-success, while probable enough in questions concerning social and political matters, is the almost certain result of all efforts which demand cultivation of the mind. If the multitude would slide into the groove so temptingly laid before their very feet, if they had eyes for what we, who wish to be regarded as their

teachers, insist upon, is their true interest, society would undergo a transformation hard even to imagine. Whether it be that this assumption of superiority on our part repels instead of attracting, or that the majority find an unconquerable dryness in all that relates to science and art, and are, consequently, slow to appreciate the advantages held out to them, or that the daily struggle for daily bread leaves little time and less relish for mental provision; certain it is that schemes which aim at the intellectual improvement of the mass, are too frequently miserable failures. Their birth-throes are separated by a brief interval from the moment of dissolution. Sometimes, if longer-lived, and fairly launched with favouring wind and tide, they founder in sight of shore, and sink to a depth far beyond all soundings.

Who, that hears the name of South Kensington, and looks on what was, within half-a-dozen years, fields and lanes, can fail to be reminded of the swelling project that emanated from the councils of the Royal Commissioners for the Exhibition of 1851? Who, that sees those bran-new stucco palaces, can help comparing this picture with that—the evidences of a brilliant commercial speculation with the proposal for concentrating all public institutions in one grand focus?

Not that the Royal Commissioners have, even now, altogether abandoned their first love; but, by little and little, their heart-hold has grown fainter and fainter, till, at last, they retain only fifteen acres applicable to a scheme that once appeared so vast and important as to demand ten times this extent of land. They may, perhaps, persuade themselves into the belief (as would seem to be the case) that, in one way or other, they really have done something towards carrying into effect the magniloquent design, which was conceived by them in the heated flush kindled by the success of the Exhibition in Hyde-park. They may point to the South Kensington Museum, and connect its existence and the creation of the Department of Science and Art with the animated aspirations that found a voice in their second report. Unhappily, the facts are against this view. The various art-schools and industrial institutions had a being, quite independent of the South Kensington Museum, which was added to them—not they to it—the whole being fused into a Governmental Department.

What are main features of management at Brompton? The purchase of objects of ornamental art, and a system of circulation. Both these methods of imparting public instruction were suggested by a Committee of the House of Commons in 1836. As far back as 1840 a considerable sum in one grant (£10,000) was voted to purchase examples of art for the Schools of Design. Improvements have, it is true, been grafted on the tree of knowledge that grows at Brompton. What wonder if its branches shoot out with vigour, when its roots are watered with £100,000 a-year!

However, let us do no less than justice to the Royal Commissioners, and hasten to admit that this illustrious body, in conjunction with the Society of Arts, formed an "Animal Produce Museum" on which large sums were spent; that they erected, at their own cost, the refreshment and retiring rooms, of which, when completed, they made a free gift to the Department; and that they also provided fittings for various sections of

the Museum.* But, in making this concession, little beyond providing a building site seems to have been added to the opportunities before enjoyed by the public—little, that is to say, as proceeding directly from the Commissioners.

To be told that the general taste has improved within the last ten years is to be told that England has not been standing still, but has marched on with the rest of Europe. What has this decennial period not done for architecture? Both schools, Classic and Gothic, will agree on this point at all events—that there has been progress of a decidedly hopeful character. Still, it would be difficult as well as invidious to point out any one in the profession who could be said to be the leader in the onward movement. Happy he who is content to share with others his renown, and thus attain the summit of dignity within reach of the true artist—humility!

It boots little to recur to what was once thought of and has now well nigh vanished, except that the threatened removal of the British Museum Collections has brought the Kensington Gore Estate prominently forward, and may, even at the eleventh hour, give a body to the will-o'-the-wisp that has eternally danced away from the feet of those who followed in its track. For this reason, then, we believe that it will be not uninteresting to pass in review the history of the Royal Commissioners' proceedings, and to learn the terms on which the nation may obtain a part of their estate for public purposes.

The year following that of the Great Exhibition, the green sward grew again over the area which the building had covered, and of its existence no trace was left but a pump and two blighted elms. The Commissioners found themselves embarrassed with a considerable surplus fund. Then it was that ambitious promptings stirred their minds, and they put forth a notable proposition, which was lacking in one most important requirement—that medium, by the aid of which alone is there any hope of erecting structures of a description more substantial than castles-in-the-air. They conceived a most comprehensive plan, which was nothing less than founding an institution that should extend over the British Empire the influence of science and art upon productive industry. This institution was to be established in the metropolis, and to be rendered, by various means, capable of affiliating local establishments in this country, in India, and throughout our colonies, for the purpose of spreading, as widely as possible, the benefits of its labours, and keeping up a constant interchange of information between the parent institution and the various bodies with which it was associated. Not only our own people and dependencies were to share in the advantages conferred, but, with true cosmopolitan spirit, it was laid down that the citizens of foreign countries should enjoy equal facilities.

In the midst of their sounding periods, misgivings appear to have shaken the minds of the Commissioners, and they expressed themselves sensible of the fact, that the sum at their disposal was altogether inadequate to the execution of such a plan as they were contemplating. The aid of the State, and of the public at large was absolutely necessary for its development and completion.

The first want was, necessarily, land on which to build, and this was found without much difficulty. It happened that a Commission,† appointed "to consider the question of a site for a new National Gallery," had reported in favour of the neighbourhood of Hyde-park and Kensington, and the Government had made some overtures for a piece of ground, situated at Kensington Gore. The negotiation was broken off, and the Commissioners (through the instrumentality of Mr. Kelk) obtained possession of the land for which the Government had been treating. This was known as the "Gore House Estate," and consisted of 21½ acres, with a frontage to Kensington-road of between 500 and 600 feet. The sum paid for it was £60,000.

Availing themselves of the ample powers conferred by the Crown in a supplemental charter, dated 2nd December, 1851, which allowed them to invest the surplus fund "in such manner as they might think fit," and to "hold lands and hereditaments in any part of her Majesty's dominions, and to apply or dispose of them" at their own pleasure, the Commissioners passed a resolution authorizing the outlay of a sum not exceeding £150,000 in the purchase of land (including their first purchase), on condition that the Government would engage to recommend to Parliament the contribution of a similar amount, for a separate, or joint account, or for division, as might afterwards be determined.

Having obtained an assurance of support from the Government, the Commissioners next turned their attention to the land adjoining the Gore House Estate, and bought 48 acres of the Baron de Villars for £153,500, paying down a deposit of £15,000.

In fulfilment of the promise given by the Government, the Chancellor of the Exchequer (Mr. Disraeli), brought the subject before the House of Commons (6th December, 1852), and Parliament granted £150,000. Eventually the Commissioners obtained a private Act to enable them to stop certain roads and make new ones on their property; and they resolved to advance a further sum of £15,000, retaining in their hands a balance of £21,000‡ for current expenses and contingencies. Application was made to Parliament for a contribution, supplemental to the original vote, and a grant was made of £25,000, which was subsequently increased to £27,500. Thus a total fund of £342,500 was raised, of which £177,500 was voted by Parliament, and £165,000 supplied by the Commissioners.

* Museum Building and Collection of Animal Produce presented to the Government, £7,476 12s.—Appendix N, Fourth Report.

† Lord Seymour, Lord Colborne, Sir Charles Eastlake, Mr. Ewart, and Sir Richard Westmacott.

‡ The Exhibition surplus was £186,436 18s. 6d.—Third Report.

The extent of land secured was 86 acres.

Gore House Estate....	21	£60,834 7 8	£2,900
Villars do.....	48	155,793 11 0	3,250
Harrington Estate and houses in Gore- lane.....	17	—	—
Total.....	86	—	—

Inconvenience having arisen from the joint tenancy as well as from inaction, the partnership between the Government and the Commissioners (in whom the legal title had been vested), was dissolved with mutual consent by means of a Bill, brought in by the Chancellor of the Exchequer and Mr. Spooner, and which received the Royal Assent, 12th July, 1858. Under this Act the lands of the Commissioners were released upon repayment by them of the monies granted in aid of their funds.

The monies set forth in the Act as due consisted of the Parliamentary grants before mentioned, together with a moiety of the net rents received up to 31st March, 1858, amounting to £3,879 4s. 2d., and made altogether the sum of £181,379 4s. 2d. Under clause 2 of the said Act the Government retained the piece of land, containing 12 acres, in the occupation of the Department of Science and Art, together with the buildings thereon, known as the South Kensington Museum. The value set on these twelve acres was £60,000, and the Royal Commissioners repaid the difference, or £121,379 4s. 2d., with a loan from the Commissioners of Greenwich Hospital of £120,000 at 4 per cent., on mortgage of their estate. In order to defray the yearly interest, the outlying portions of the property, four in number, and containing about 12 acres, in lots of, respectively, $3\frac{1}{4}$ *, $2\frac{1}{2}$, $5\frac{1}{4}$, and $1\frac{1}{4}$ acres, were let on building leases.

The estate is thus distributed:—

	Acres.
Retained by the Government for the Department of Science and Art.....	about 12
Lent to Horticultural Society.....	22
Lent to the Society of Arts for the International Exhibition of 1862.....	16†
Outlying pieces let for building purposes.....	12
Devoted to roads.....	9
Unappropriated.....	15
Total.....	86

The space which remains at the disposal of the Commissioners lies partly along Prince Albert's-road on the west, Kensington-road on the north, and Exhibition-road on the east of the main square. At the corner of Kensington and Exhibition-roads a small property of two acres, belonging to Lord Anekland, called Eden Lodge, intervenes.

The acreage of the unappropriated land is as follows:—

	Frontage.	Acres.
Prince Albert's-road.....	W. (about)	$6\frac{1}{2}$
Kensington-road.....	N. "	5
Exhibition-road.....	E. "	$3\frac{1}{4}$
Over the entrance to the Horticultural gardens, which would have to be arched over.....	W. "	$\frac{1}{2}$
Total.....		15

In a Parliamentary paper, ordered by the House of Commons to be printed February 15, 1860, is a report from a Special Committee of the Trustees of the British Museum. It is there assumed that a site can be had at South Kensington for £5,000 an acre. The joint ownership was cancelled in January, 1859, and from that time the Commissioners have had an absolute right to dispose of this land on any terms they please. When their attention was drawn to the above-given statement,† they considered what sum they would be prepared to take for these (or any portion of these) 15 acres, if application were made to them, and they decided to ask £10,000 an acre, and £5,000 per acre for that part—a quarter of an acre—where the necessity of arching over the ground under the agreement with the Horticultural Society would leave no ground floor space available. The marketable value of the land would, it is believed, be understated at £20,000 an acre; for a piece of about $2\frac{1}{2}$ acres, on the west side of Prince Albert's-road and south of Gore-road, is let on lease for 99 years at a ground rent equivalent to £20,000. Here the frontage was valued at £3 per foot by a depth of about 200 feet, and that on the east side of Prince Albert's-road is considered to be also worth £3, whereas the frontage to Kensington-road cannot be put at less than £4 a foot by 200 feet deep; so that, adopting the same proportion, the value per acre would actually be £26,000 or £27,000; and this for land which was bought ten years ago at £3,000.

The main square of the estate, bounded by the four great roads, contains about 55 or 56 acres, of which 53 belong to the Commissioners. The remainder, about 2 acres, is (as already stated) the property of Lord Auckland, and situate at the north-east corner, fronting to Kensington-road.

The property is laid out upon the principle of erecting buildings round the border only of the square, leaving the centre unbuild upon. The latter, to the amount of $22\frac{1}{2}$ acres, is let to the Horticultural Society on a lease of 31 years from the 1st of June, 1861, at a contingent rental if they earn profits. The lease is renewable for a further period of 31 years, on application being made two years previous to the expiry of the

first term. In case the Commissioners decline to renew the lease they are to pay to the Society, by way of compensation, a sum of not less than £15,000, and which, in certain contingencies, may be greater. The Commissioners, having undertaken to erect arcades and execute earthworks at a cost of £50,000, raised this amount by a second mortgage loan from Greenwich Hospital, at the rate of $4\frac{1}{2}$ per cent. interest.

The 16 acres lent to the Society of Arts for the International Exhibition, are granted, rent free, up to the 31st of December, 1862, and will be reserved for another Exhibition in 1872, on payment of £10,000. A plot, on which stand the picture galleries facing Cromwell-road, is let on lease for 99 years to the Society, on condition that the permanent buildings shall be used solely for holding exhibitions, that they do not cover more than an acre of ground, and that they have a sum expended on them at first of not less than £20,000, to be increased, if required, by the Commissioners, to £50,000, at the close of the Exhibition, in order to give the façade a suitable architectural character, and to avoid any disfigurement of the estate. The Trustees of the Exhibition subsequently obtained four more acres between the Horticultural Gardens and Prince Albert's-road, with the stipulation that they should build permanent walls to two arcades and a roof to the south arcades in place of the temporary structures which the Commissioners had agreed to erect. In consideration of the saving effected, the latter have agreed to credit the Trustees with a sum of £1,300, if the Exhibition of 1862 should yield no profit.

Mr. Bowring, in his evidence before the Committee on the British Museum, speaks of the cost of the estate as £5,000 an acre. It will be seen, from the items already given relating to the Gore House and Villars estates, that 69 acres were bought at rather more than an average rate of £3,000 an acre. With the plan before one, it is impossible to be blind to the fact that it is precisely the two just mentioned properties with which the public will have to deal, if at all. The nation could have had—indeed, did own—the Gore estate at £3,000 an acre. Granting that from first to last the cost has exceeded £5,000 on the average over the whole property; still, here is an advance of price to double the amount. We are to pay £10,000, and this (as we have seen) is half, or less than half, the marketable value.

The Commissioners say that they "offer the land at a lower price than the market value, because they consider the British Museum to be an important national institution. If Parliament wish to remove any part of the collections to Kensington, the Commissioners are anxious to afford every facility in their power, and feel that they should not deal with the question as a purely mercantile transaction." Yet the sum asked has something exceedingly like a "mercantile" look of 100 per cent. profit. The Government can most certainly be alleged to be perfectly free from any commercial taint, for they have evidently, somehow or other, made rather a dubious bargain in the public interest.

It should be borne in mind that the money spent on the Commissioners' estate has been applied in the most extraordinarily profitable manner. The outlying land is let on building leases for ground-rents which pay the interest of the loan from Greenwich Hospital. It is calculated that the fee simple of them would, if sold, produce £120,000. The main square is valued at £500,000. Here, then, we have the enormous amount of £620,000, exclusive of the 12 acres retained by the Government, and which are now supposed to be worth £100,000. The utmost penny that the estate has cost has been £382,051 13s. 9d.*

* We have been at some trouble to prepare the following:—

Account of the Receipts and Expenditure of Her Majesty's Commissioners for the Exhibition of 1851, from 29th February, 1852, to 31st December, 1860.

[Vide third and fourth Reports.]

		RECEIPTS.		£	s.	d.
1852.	February 29.	Balance from general account being surplus fund carried to estate account		186,436	18	6
1859.	January 12.	Value fixed by the Lords of the Treasury for the land retained by the Department of Science and Art		60,000	0	0

				6,970	15	7
		For museum building and collection of animal produce presented to the Government		7,476	12	0
		For printing, office expenses, salaries, wages, &c.		4,877	3	1
		For repairs to houses	£ 323	16	8	
		For taxes on houses	1,417	16	3	
				1,741	12	11
		For outlay on arcades on account of contracts.....		24,300	0	0
				382,051	13	9
		By balance, cash, and securities		42,450	0	10
				£424,501	14	7

* A portion of this land (on which the houses called Queen's-gate-terrace are built), is exchanged for land belonging to Mr. Aldridge, in Kensington-road, eastward of Gore-lane.

† Four more acres were afterwards allowed to be temporarily taken for the annex.

‡ Founded evidently on the price allowed by the Lords of the Treasury for the space in the occupation of the Science and Art Department.

§ Probably this decision applies only to five acres, or thereabouts, which are talked of as required for the British Museum.

Our opinion as to the removal of any portion of the British Museum Collections to South Kensington has been so recently given that we need not here repeat our objections. It is very possible that we have been looking at the silver-side of the shield—from the point of the shilling public. Truly, to pass over to the golden-side—shall we say with the guinea folk?—is to be sensible of a decided change in the effect produced on the mind. What can be more agreeable and delightful than to drive from the Park to the Horticultural Gardens, and stroll through the grounds in genial summer weather, of which, in the budding leaves, we begin to recognise the promise? When satiated with the gardens to lounge and eat ices in the arcades, and thence to pass to the picture galleries in Cromwell-road; or, if the Natural History Collections shall be transferred to Kensington-gore, to gratify yet another taste: how very pleasant is all this! Let us not omit the South Kensington Museum, with its multifarious objects. Then, if the National Gallery can be moved to the same spot, and present towards the Park its (undesigned) grandiose front, we know of no aristocracy that would be so well provided as our own with all that appeals to the finer and more cultivated feelings of a humanity, which (we could almost doubt that) they share with the toilers and workers of London.

Be it so. But let us make no pretence about consulting public convenience. Why not boldly confess that we held a Great Exhibition; that a large surplus fund was built up of the contributions of the people; that we talked and pottered, pottered and talked, till, at last, we contrived the most charming places of recreation for the idle and the wealthy within the closest neighbourhood of their usual gay haunts; that we went to Parliament and charmed to sleep the senators, who, though they arrogate to themselves the title of the people's champions, yet raise their bold voices in any and every place but the right one; that we moved our national collections of pictures and natural history; and, more than all, that we actually succeeded in making everybody believe that we could do and did all these things for their benefit, not in the interest of a section, but in that of the whole public?

Our columns may yet have to record the successful, though gradual, prosecution of these schemes which appear to be ripening. When we remember the weighty names and high influence that can and will infallibly be brought to bear, the issue seems no longer doubtful. Well, we shall have had the satisfaction of having uttered one protest, and shall enjoy the consolation of knowing that, to the last, we denied and denounced the *invention* of the centre of London.

NOTES FROM THE PROVINCES.

Hereford.—The Corn Exchange of this City has just received the addition of a clock turret, fitted up with illuminated dials. The upper portion of the turret contains the bell, and is surmounted by a figure of "Ceres." The total cost of the works is about £250. Messrs. Elmslie, Franey, and Haddon, architects, designed and superintended the works, which were executed by Mr. Beavan.

The Mersey Docks.—On the recommendation of a special committee the Mersey Dock Board on Thursday agreed to construct new warehouse for the corn trade, and new graving docks on the Merenlaneum estate, at a total cost of £261,000.

Nottingham.—The directors of the Ancient Order of Odd Fellows, some time since, determined on erecting an Imperial Hall for the purposes of their Order in Nottingham; the building to be also available for musical concerts and public assemblages. The site selected is at the junction of Sheep-lane and Upper Parliament-street. The frontage to Parliament-street will be upwards of 140 feet, and to Sheep-lane 160 feet. A by no means inconsiderable advantage which the building of the hall holds out, is the opportunity of improving the approach to the Market place. The building is to be Italian in character, having pavilion-roofed turrets at the corners, enclosing the staircases—of which there will be four. The principal front will have on the ground story an arched entrance of three openings, leading to a vestibule, given access to the two principal staircases. In the east front, there will be eleven shops, divided by rusticated piers, from which spring semicircular arches. The division between the ground and upper story, is marked by a Doric cornice, with carved consoles, and triglyphs. There is a series of eight Corinthian pilasters and columns on the upper story of the Parliament-street front. The towers rise somewhat higher than the adjoining balustrading. The roof will be a conspicuous feature. The ridging of the main roof having open iron work, partly gilt. The whole exterior will be faced with the best pressed bricks and Hollington stone, the latter predominating. This stone has been decided upon as being not affected by the acids of the atmosphere of towns, and as being very durable. As to the interior: on the ground floor, occupying the space not devoted to the shops, will be a room capable of accommodating four hundred persons, and not less than seventeen feet high. The rest of the space not occupied by staircases will be divided into rooms available for the purposes of the order. The accommodation in the upper story will consist of a large room, capable of seating 2,500 persons, and about 140 feet long by 60 feet wide. At the south side there will be a recess for the organ; but the orchestra will not be recessed. On each side of the hall there will be a gallery which, at the Parliament-street, or north end, will extend over the entrances from the staircases. The front of the gallery will be curved. The orchestra, instead of being entered from below, will have the approach from the gallery staircase, at the south end. The ceiling will be slightly coved at the sides and ends, and deep panels and projecting mouldings will be avoided, "so that nothing will impede the transmission of sound in smooth unbroken volume to the furthest parts of the hall." Mr. Bakewell is the architect.

THE ALBERT STATUE AT LIVERPOOL.—We mentioned some time ago that the Corporation of Liverpool had voted a sum for an equestrian statue to the late Prince Consort. The commission to execute this work has been given to Mr. Thornycroft.

MEDIEVALISM AND BEAUTY.

BEAUTIFUL, undoubtedly, are the Medieval works. There is beauty in their plans and general forms; there is beauty in the most characteristic and prominent features, such as the pointed form of their arches and the intersection of the ribs of their vaulted roofs. Springing from the stem-like vaulting shafts, and gracefully bending, like the leaf-laden boughs of a tree, to meet each other half-way, beautiful are the leafy bosses which adorn the union of these meeting members; beautiful are the tiles that lie beneath our feet as we solemnly enter the church; beautiful is the glass, saint enriched, that fills the windows above the stalls; beautiful, on the whole, is the carved foliage that adorns the capitals and other parts of these wonderful buildings; beautiful is the expression and religious sentiment of the sculptured figures. That all these things are beautiful, no one can feel more than I do; but yet in this present age it is useful to point out that, in taking old work or old principles as examples, we may have Medievalism without beauty, and that in designing a Gothic building we have a choice to make. And what is that choice?

A few years ago we necessarily were bound not to design any building so as to use any ornaments in the details for which we could not find a precedent, for we were then learning the true spirit and feeling of the style. We now, having accomplished a great degree of perfection in copying or reproduction, have arrived at taking rather the principles than the actual ornaments. We design, *i.e.*, really originate, new forms of buildings with new forms of ornaments in the Gothic manner; this is our present position. What is, then, the choice which each of us, in designing such buildings, has to make? It is in the property or qualification that the building shall possess when it is finished. Will our end be fully accomplished when our building is finished, when the last scaffold is removed from above the spire, if that building is in every respect, as regards its spirit, its kind of ornament, its general effect, its proportions, a Gothic building? Or shall we be not satisfied unless every form, every detail, every sculptured figure, every carved leaf, pleases us as artists; every colour not according to some ancient rule, but in accordance with the very latest investigation of the harmonies of colour, and the laws which cause beauties of colour in nature? Or, in other words, our choice lies between Medievalism and Beauty.

Are we such strict antiquaries that the style of ornament that pleased the architects of the thirteenth century necessarily pleases us? or are we so keenly alive to the beautiful that we quickly see that in designing a similar building to those that have been built before, beautiful as they are, that there is yet room for improvement? And so, wherever the two things—correct Medievalism and artistic beauty—seem to clash, we should instinctively throw over the Medievalism to obtain the beauty.

In visiting some of our best nineteenth-century Gothic buildings, I think few unprejudiced observers can come to any other conclusion than that in many beauty is certainly sacrificed to Medievalism, and that even in the most beautiful and the most original of such works that great improvement would have been seen if many of the ornaments had been submitted by the designer to the test of his own unbiassed taste and artistic genius as to whether they were really beautiful, and not at once admitted into his building without examination because strictly in accordance with Medieval principles. To explain, perhaps, more clearly what I mean, let us take a few of those architectural features that are more particularly open to the loss of the beauty they might possess, on account of either the habit, or the deliberate choice of Medieval example in their forms, in negligence, or in defiance of the pursuit of beauty.

Take the capital of a column or pier, even in so important a position as supporting the chancel arch. Artistic feeling would say, choose the most beautiful, the most pure, the most holy forms in earth or heaven for such a position, and, indeed, in many great examples Medievalism says and does so too; but in other instances Medievalism says, put two ugly monsters entwined together, singularly ugly and inappropriate for ornaments to capitals at all, especially in the place that I have mentioned, yet in some modern cases beauty and feeling have been rejected and the quaintest Medievalism chosen.

Is it window tracery—an architectural feature unusually capable of beautiful treatment, and affording wonderful opportunity for original and artistic design? How often do we see buildings, otherwise beautiful, disfigured by forms of window tracery having no artistic beauty at all, and no merit at all, except being similar in actual form, or else in principle, to those in some inferior Medieval building, for we cannot shut our eyes to the fact that Medieval buildings were liable to be good and bad in some degree, even if by the traditions or means of handing down the art the varieties of work were not so great as they are at present.

In plate tracery especially the artistic feeling for beauty of outline is more particularly called into play; the forms of the bright flowerets, or stars, filled with many-coloured glass, are very important when seen from within the church; and the form of the dark stars or flowers, as seen from the exterior, require all the careful and experienced skill of the artist. I do not say that you will not find some of the very best and most beautiful forms for these purposes in Medieval work, but I do say that if you are in the habit of taking any form from old examples, without sufficiently considering whether they are beautiful, or have sufficiently determined to make beauty your object in the selection, you are very likely, owing to your antiquarian prejudices, to produce a result which will be quite the reverse.

Then, with figure sculpture, no doubt that Medieval expression as found in the sculpture of those times is good; no doubt but that it is, in its deep religious feeling and purpose, a thousand times better than that of the

later Renaissance; when it became the fashion in all works of art, as Ruskin truly says, to deny Christianity. No doubt but that sculpture, like that of old, with all its crudeness and faultiness of proportion, was a thousand times better than the most refined works of sculpture of a few years ago, when pagan subjects were still the fashion, and the denial of Christianity in all matters of art was equally apparent.

No doubt we ought to welcome with joy, not only the revival of Gothic architecture, but the revival of the good old habit of offering our best gifts of art and of skill to the service of religion. We now once more have begun to give to that service our most precious materials, our deepest thought, our most careful study of old works, and our greatest genius in the designing of new buildings in the olden manner. Can we not, then, bring our very highest powers into this service, our imagination, our highest appreciation of natural and artistic beauty.

During the time that Gothic, or purely Christian, architecture slumbered, there is no doubt, that in spite of the true end and purpose of art having been lost, that great perfection was attained in painting and sculpture by the diligent study of the antique. Can we, now that our minds are again set in the old paths, gain nothing of beauty and perfection of figure design from those intervening ages? When the Romans became Christians, they cast their eyes around the imperial architecture of Rome to see whether anything could be consecrated to the service of their new faith. They rejected the temples that had been used for heathen worship, but they chose the beautiful basilicas and converted them to their own use. So, then, in Gothic sculpture, let us firmly retain the religious expression—let us, in painting and sculpture, more than we ever have before, consecrate our talents to sacred subjects. But why our apostles and saints should not be as correctly and naturally proportioned, why they should not be as beautiful in form or countenance as Apollo and Venus; why they should not engross the time, attention, and talents of our greatest sculptors and painters, I know not. Let us reject the pagan subjects, but not the pagan knowledge of form; let us leave the Greek poets, but not the Greek love for poetry and poetic feeling; let other subjects but the Goddess of Beauty engage our chisels and our pencils; but let us not lose the ancient love for beauty. Grasp firmly Christian feeling, Christian expression; let us hold firmly the love of truth; but surely it does not show our love of nature, or of the great Author of it, to imply—as much of our art at the present time seems to do—that, to be true to nature, we must reject the beautiful. Singular is it, in the sister art of painting, that a rejection of the highest forms of beauty and imagination should have come in simultaneously with the greater love and closer study of nature. It seems to me that it is because the painters of the reforming school base their principles too much, even to a blind imitation, on the old manner of the masters before Raffaele, instead of merely introducing as a reform a more genuine and careful study of nature, without mixing up the pre-Raffaeleite masters in the matter, and so giving scope for the error of introducing many of their shortcomings along with the increased study from nature. Certain it is that a great and blind antiquarian love of any bygone style is always destructive to the artistic and progressive development of any art. A love that will not brook any alteration—a love that is sure to think any design beautiful simply because it belongs to that style, without any careful analysis of its own individual merits, must necessarily make us put much into a design that the old designers themselves, very probably, were not satisfied with, and which they would not, probably, repeat, if they had the opportunity of designing it again. It is, indeed, very well to study and be perfectly acquainted with all the styles that have prevailed before our time; it is better still, in my opinion, to be still more perfectly acquainted with one particular style or section of a style, and to practise in it; but we should take care that our being antiquaries does not interfere with our being artists, and that our power of discriminating at a glance whether this or that detail belongs to this or that style, or whether it is correct to use it, does not bias our artistic judgment as to whether or not it really looks well and pleasing in its place when we have used it—or, in other words, whether, while it is in correct accordance with the chosen Mediæval style, it is really beautiful.

For, although granting that Mediæval work of the best periods is mostly beautiful, I cannot give in to the dictum that, because it is old, it must be beautiful. Let us lay hold of the leading principles, because, when used before, they certainly produced beauty, and therefore will, if artistically followed, produce it again. But let us use our individual talent and judgment, so that progress and development may be the result, and that each building raised may be more beautiful than the last. And, as one source of great beauty that is much neglected, I would ask why, in so many of our modern buildings—although the Oxford Museum is an honourable exception—while the style of Mediæval art in which the window traceries and many other details are most beautiful, is more followed at the present time than any other, the Mediæval example of that style is not followed of decorating the carved portion of the building with natural foliage instead of a quaint conventional form.

In our English buildings of the time alluded to most beautiful examples of natural foliage may be seen, so that it would seem that, where Mediævalism and undeniable beauty go hand in hand together, then, and then only, it is departed from. The truth and honesty of purpose in the material of our best buildings at the present time is highly commendable. The purest style of Mediæval art is, for the most part, selected. So far, again, it is well. We have begun to produce buildings differing greatly from all that have been built before, and essentially our own. That, again, is good. We are now introducing much both of painting and sculpture into our buildings. That is a subject for congratulation; but still many a building is undoubtedly marred by the severe and hard conventionalism

in figures, drawing of coloured decoration, painted glass, and carved foliage, and we still have in many instances to regret that in these particulars much of the beauty of the building is often sacrificed to Mediævalism. R. D.

RAILWAY EMBANKMENT TO FRANCE.

"NEPTUNE," writing to the *Whitehaven Herald*, proposes—"An embankment carried across the Channel, formed of rocky and rubble materials, obtainable in plentiful abundance on the coasts of England and France, adjacent to the site for the work, appears to me the soundest scheme; and as the surplus labour available in the Western States of Europe and of all Great Britain would be forthcoming for such an undertaking, the cost of constructing it, though a mighty work, would not be so serious a matter as may at first appear. The sectional form of the embankment should not be exactly that of ordinary railway embankments. It would have a level flat surface for the various lines of rails of different companies, which would be about 30 feet above the level of the sea at high water, and having a mound of rock on each side (their use being obvious) 20 feet high, and 40 to 50 feet at the base, and angular, or parabolic shaped. The level flat surface for the railways would be a mile across, from inside of mound to inside. The sides of the embankment would slope down into the sea at an angle of 45 degrees at level of high water, and, spreading out as they approach the bottom, would afford ample space for the raging billows rolling along the Channel during a winter storm to expend their fury. There would have to be a lofty lighthouse, either in the centre of the embankment, showing a revolving brilliant light, or a lighthouse on each side, one showing a red and the other a green light, stationary. The site for the embankment would be chosen as nearly opposite to the boldest points of the rocky acclivities of the two coasts as practicable, with the object of carrying a cutting through for the lines of rail, which operation would be the commencement of the undertaking, as it would afford a large amount of rocky material with which to start the embankment. I am bold to say that if the French and English Governments once granted their approval and consent to the scheme, and would further proffer their assistance of the most skillful engineers and sappers and miners, together with a troop of the most reliable and energetic portion of their unoccupied armies, in conjunction with a small army of labourers collected out of the various states and provinces of Western Europe and Great Britain, and further, if the two Governments would engage to provide the requisite appliances and an unlimited supply of powder out of the stocks lying in their various arsenals, I am prepared to say this important undertaking would be carried out to a successful issue at comparatively a very moderate cost in the short space of six or seven years from its commencement. The arrangements, of course, should be all made under the guidance and management of eminent civil engineers of this country and France. After carrying the cuttings through, say two miles to three miles wide, until they find a proper level inland for joining the various lines of rail on the continent, and within certain limits, and calculating how far the operation of quarrying and exploding the rock would be required to obtain a sufficiency of material to complete the work—the solid contents of the rock required to make the whole embankment being known—the measurements would then be easily taken of the adjacent cliffs to find out the extent it would be required to prosecute the quarry operations to furnish the material. The next operation would be quarrying laterally to the direction of the embankment upon the edge and parallel with the two sea coasts, and until the embankment was finished. It is a very simple calculation to ascertain to what limit these quarrying operations should be extended, knowing the solid contents of the material required to complete the undertaking. The iron rails now in use on the lines of this country and the continent are not of sufficient strength and substance to convey the weights that they would be required to bear; and it would be, therefore, necessary to have manufactured rails of, say fifty to seventy-five per cent. larger sectional area. The tilt waggons and locomotive engines would have to be of a ponderous description in size, strength and power, to convey the immense weights they would be required to carry over the embankment. Powerful cranes would also be required to lift the immense masses of rock that would have to be conveyed along the line to the sea coast and along the embankment to be deposited on the bed of the channel.

As far as I have gone, the first thought that will strike the reader is the fact that the passage of the channel for shipping is completely blocked up. To obviate the inconvenience thus occasioned to the free navigation of shipping through Dover Straits, I have next to propose that we make what I shall for my present purpose designate double harbours of refuge on both sides of the channel, the sites of which should be at the extremities of the embankment somewhat inland. The harbours would consist of a basin on each side of the embankment, for admitting the vessels arriving from the Atlantic or the North Sea side of the channel, until they gain admittance into the floating dock. The latter would be made inside of the basins, and at each side of the embankment, say about one mile apart, or in a line with the mounds, and being joined by a lock of sufficient width to allow shipping to pass of the largest tonnage. The use and object of these harbours is then explained. To further develop the idea, the writer says, a Grand Trunk Railway would be the next operation, carrying it across Europe, through Belgium and the southern districts of Germany, making a boring through the Alps range of mountains, and crossing Turkey in Europe, passing the Bosphorus, through Turkey in Asia, across Persia, Cabool, and, going near the southern base of the Himalaya mountains, continued on to China as far as Peking. The amount of wealth required to work out this vast scheme no doubt may be a great obstacle to its present achievement, but the day is not so very far distant when it will be a work of sheer necessity from the force of circumstances now arising.

THE NEW STREET IN SOUTHWARK.—A return has been issued showing the date of all purchases made by the Metropolitan Board of Works of property required for the purposes of the new street from High-street, Southwark, to Stamford-street, and the sum spent, together with many other particulars relating to the purchases. The aggregate amount of purchase money paid is £372,954. The sums paid for land tax amount to £339. The aggregate amount of interest paid by the Board on money borrowed for the purposes of the new street is £31,892.

MARC ISAMBARD BRUNEL.*

MARC ISAMBARD BRUNEL was born at Haequeville, in Normandy, on the 25th of April, 1769. The name, says his biographer, is found at every period in the ancient records of the province, and the privilege of *Maitre des Postes* of the district seems to have been an inheritance of the family. At eight years of age, and shortly after his mother's death, he was sent to the College of Gisors, it being intended that he should succeed to a living in the gift of the family; but his evident dislike of this life, and the predilection he always evinced for mechanics and construction induced his father, most unwillingly, however, to send him to a friend, M. F. Carpentier, at Rouen, under whose directions he then first studied drawing and hydrography with the view of qualifying him to enter the navy. We learn nothing of Brunel's life from 1786 to 1792, except that he "seems to have been actively engaged in his profession;" but in 1793, when the reign of terror commenced, he with difficulty obtained a passport to America, and sailed from Havre on the 7th of July, landing at New York on the 6th of September. Finding here the French squadron, he joined the company of M. Pharoux, an architect and surveyor, and M. Desjardins, who were then organising, on the part of a French company, the survey of a tract of land near Lake Ontario, of over 220,000 acres. These three, supplied with a few axes and fowling-pieces, and accompanied by four Indians only, set out to explore and map a region previously scarcely known.

Mr. Beamish has been unable to furnish us with any correspondence or notes relating to the undertaking, and we next meet with young Brunel on his return to Albany and New York. During the return journey the three travellers made the acquaintance of a Mr. Thurman, an American loyalist, who engaged them to survey a line for a canal to connect the river Hudson with Lake Champlain. This, says his biographer, became the turning point of Brunel's life. He had intended to return to his own country should tranquillity be restored and a constitutional government be established; but fortuitous connection with Mr. Thurman determined his destiny—"France and her brilliant naval service was abandoned for America, and the humble profession of a civil engineer."

The direction of operations devolved on M. Pharoux, but that gentleman soon resigned in favour of Brunel, who, in his new capacity of director, turned his attention to the improvement of the navigation of rivers. Here his natural bent of mind greatly aided him, and "his ingenuity soon suggested the means of freeing their beds from masses of rock and embedded trees, and, by lateral cuts, of evading falls and cataracts which rendered navigation not only dangerous but often impracticable." He may, therefore, continue Mr. Beamish, be considered as the pioneer of those great inland communications which have tended so largely to promote the commercial prosperity of the States.

Having thus, "in less than twelve months, achieved a name and secured an independence," Brunel prepared drawings in competition for new council buildings, and his designs were accepted, but, owing to the cost of carrying them into execution, the scheme was abandoned; soon after plans were required for a theatre in New York, and, with considerable modifications of the former design, Brunel's were accepted. The work, however, failed to procure him any direct pecuniary benefit, and the building was destroyed by fire in 1821.

Brunel was next appointed Chief Engineer of New York. There exists no record of his practice in that city, but it is said that he received but inadequate reward for his services, notwithstanding which he declined to accede to invitations to return to his own country. Among the subjects to which he first directed his attention during his stay in America was the manufacture of ships' blocks by machinery.

On January 20, 1799, Brunel sailed from the American shores bound for England, landing at Falmouth in March following, here, soon after, he married Miss Sophia Kingdom.

Brunel took out his first patent in England in May, 1799, for a "duplicate writing and drawing apparatus"—what is now termed a manifold writer; in principle it resembled the pantograph. Soon after he invented a machine for twisting cotton threads and winding it into balls. It was very generally adopted, but as it was not protected by a patent, the inventor received but little remuneration. He also, about this time, devised a little machine for the use of indolent whist players, by which the cards were, by simply turning a handle, effectually mixed, divided into four equal parts, and presented to the players. This machine was given to Lady Spencer.

Mr. Beamish next advances, at some length, Brunel's claim to be the author of block machinery,—an honour which has been claimed for Sir Samuel Bentham. To this point the author devotes some forty-five pages in vindication of his hero's rights. He says "Where fifty men were necessary to complete the shells of blocks previous to the erection of Brunel's machinery, four men only are now required; and that to prepare the sheaves, six men can now do the work which formerly demanded the labour of sixty. So that ten men can accomplish with uniformity, celerity, and ease, that which formerly required the uncertain labour of one hundred and ten."

In 1805 Brunel suggested an apparatus for bending timber, and took out a patent for sawing timber in an easy and expeditious manner. The improvement consisted in the modes of laying and holding the piece of wood in the carriage or drag; in the facility of shifting the saw from one cut to another; and in the practicability of sawing both ways, either

towards or from the saw. In the following year he patented a machine for cutting veneers, and in 1808 a circular saw.

In the same year he received a grant of £4,500 for services rendered to the Royal Arsenal, Woolwich, and removed to Lindsey-row, Chelsea, having erected at Battersea saw mills, in which he invested all his available money, with the hope that he had thereby secured a provision for his family and his own declining years. This hope, however, was not to be realised.

Brunel next took out a patent, 1810, for improvements in obtaining motive power, and in 1811 submitted a comparative statement to the Navy Board, which exhibited the importance of substituting machinery in the dockyards for the handwork then employed. We next find him actively and successfully employed in superintending works at Chatham; then in the development of a scheme for making shoes for the army, in which he invested large sums of money, the greater part of which was lost, owing to a reprehensible want of decision on the part of Government and the conclusion of peace.

In 1814 he made his first experiment on the Thames, with a double-acting marine steam-engine. Having accomplished his voyage to Margate he was desirous of obtaining accommodation for the night, but this was not so easy. So strong was the prejudice which the new mode of transit excited in the minds of the inhabitants, particularly those connected with the sailing packets, that, blind to their future interest, they threatened personal injury to Brunel, and the landlord of the hotel absolutely refused to provide him with a bed. Twenty-two years later, on visiting Ramsgate on business connected with the proposed railway, he wrote to Mr. Beamish:—"If they knew at this moment that I come to carry off the cargoes of the steamers to Ramsgate, I might probably share the same fate."

Brunel seems to have been always devising and inventing, and we next find him engaged in designs for a bridge over the Neva, at St. Petersburg, in which he proposed to construct a framing of carpentry capable of forming an arch 880 feet span. The condition of the Imperial treasury, however, prevented its being carried into execution. The design is shown by Mr. Beamish in a plan and elevation.

By this time the sawing establishment at Battersea had fallen into inextricable confusion as regards financial matters, and in August, 1814, a fire broke out, which in two hours nearly destroyed works which had been valued at £24,000. Brunel's resources, however, seldom failed to assist him, and the right wing of the building and the steam-engine having been saved, he at once sought for means to repair his great loss; this was not so readily obtained, for out of a capital of £10,000 in October, in June following there remained but £865. But "still relying," says Brunel, "upon the pecuniary aid I could bring in, I pushed the enterprise without interruption. Availing myself of the experience I had acquired, I directed my attention to all the improvements that could be introduced consistent with our scanty means." But many a "sad to-morrow came and went" before he received substantial relief, which at last came in a grant of £5,000 from Government.

Restored to his home, says Mr. Beamish, with a heart grateful for the liberality which had been accorded him, we find him resuming the general supervision of the works at Chatham, and in designing, under the authority of Government, saw-mills for the Island of Trinidad. Soon after, 1821-22, a commission was issued by the French Government to obtain designs for suspension bridges, to be erected on the Island of Bourbon, and Brunel was applied to. The span to be crossed was only 122 feet, but the locality was subject to "hurricanes moving with a velocity of 120 to 150 feet in a second, to resist which his ingenuity, in the absence of authority, was sufficiently taxed. The designs were accepted by the French Government, and a contract was concluded between Brunel and the French Minister for £7,000, the work to be executed in four months. But here the same fatality which had already marred Brunel's commercial prosperity was found still to cling to him. From various causes the work was delayed, and Brunel, in December, 1822, entered a formal protest against the breach of contract, "thereby," he says, "subjecting me to great loss and injury, and to have the bridge, when completed, rejected." Brunel records in his journal, 15th January, 1823—"The cold so intense that cast iron 15 inches by 10 inches was broken."

Passing over several years, during which Brunel was as actively employed as ever in devising various contrivances, we come to the "great and final effort of his ingenuity and skill"—the Thames Tunnel. In 1818 he took out a patent for a machine of iron, forming anger-like cells for the miners, and which should be forced forward with a rotary motion by hydraulic presses, displacing only so much ground as the machine would occupy in its place; and in 1824 the first general meeting of the promoters of the tunnel was held in the London Tavern, when 2,128 shares of £50 each were taken up. Brunel was appointed engineer to the company, with the salary of £1,000 per annum for three years, the period which it was considered the work would take to complete; and in addition to his salary he was to receive £5,000 when the body of the tunnel was carried sixty feet beyond each side of the river, and a further sum of £5,000 when the first public toll under the Act of Parliament was received for the use of the proprietors. Mr. Beamish, who assisted Brunel in the work, gives a detailed account of the progress of the work, with all its successes and failures, from its commencement until it was opened to the public on the 25th March, 1843. Within fifteen weeks from that date "upwards of one million of visitors had done homage to the directing spirit of the Thames Tunnel." Brunel had, however, succumbed to the long and uninterrupted strain on his faculties; paralysis had already exhibited itself; and although he was able to be present at the opening ceremony, and lived until the 21st

* Memoir of the Life of Sir Marc Isambard Brunel, Civil Engineer, Vice-President of the Royal Society, corresponding member of the Institute of France, &c., &c. By RICHARD BEAMISH, F.R.S. 8vo, pp. 359. Longman and Co.

December, 1849, his professional labours terminated with the completion of his greatest work.

There are some pages in Mr. Beamish's volume which we would rather see expunged in a future edition, but he has given us many interesting details of Brunel as an engineer.

ON RETAINING WALLS.

At a meeting of the Civil and Mechanical Engineers' Society on the 27th of March, 1862, Mr. WALTER RUTT read a paper on Retaining Walls, in the course of which he said a retaining wall may yield bodily in three ways:—

- 1st. It may turn over, revolving forward upon the foremost point of its base.
- 2nd. It may slip forward, while still retaining its erect position.
- 3rd. The earth may yield to the pressure of the superincumbent weight.

The same three things may occur within the substance of the wall itself, viz.:—

- 1st. A portion of the wall may break loose from the lower part and fall forward.
- 2nd. The upper part may slide upon the course below it.
- 3rd. The material of which the wall is composed may be crushed by the pressure.

The effect of the earth upon the wall was then treated of, it being considered that the prism of earth between the wall and the line of rupture had a tendency to slide down the line of rupture, as down an inclined plane, thus exerting a pressure upon the wall at one-third of its height parallel to the line of rupture. By setting off a length in this direction to represent the pressure, and a vertical length to represent the weight of the wall, the resultant pressure upon the base is found. If the centre of pressure fall within about three-eighths of the width of the base from its foremost edge, it may be considered a safe proportion. The farther back the centre of gravity of the wall lies the farther back will be the centre of pressure, thus showing the advantage of giving a batter, and especially a curved batter, to the wall. By considering each point in the height of the wall as the base of a distinct wall, it will be seen that the wall may taper off to a point at the top, giving a triangular profile.

To prevent the courses sliding upon one another it is best to lay them square with the batter, sloping slightly downwards towards the back; an inclined base will also prevent the foot of the wall from being pushed forward upon the earth below it. The yielding of the earth below the foundations is a frequent cause of failure, which should be guarded against by extended footings, or, in bad ground, by the use of piles. A very good example of this is seen in the quay wall at Rouen, which stands on a bank of soft mud, the river deepening rapidly in front, and is supported upon a system of piles braced together by transverse timbers.

Thus far walls of uniform section only have been considered; but, by the use of counterforts, the centre of gravity may be thrown further back, and an increased strength be obtained with the same materials. Care must be taken to insure a perfect bond between them and the body of the wall; or, as in the case of the Old Hunger Dock, the latter may be forced forward, leaving the counterforts some feet behind. A still greater advantage is gained by placing the buttresses in front, or by building deep piers at intervals with vertical arches between them, which system has been adopted upon the Hampstead Junction and the Metropolitan Railways.

Another point requiring great attention is drainage. Earth saturated with water not only being heavier, but its natural slope being greatly flattened, its action approximates to that of a dense column of fluid. On the Euston incline of the North-Western Railway the sides of a cutting through the London clay are supported by retaining walls about 25 feet high, having a curved batter; the wall upon one side bulged considerably, in consequence of the accumulation of water behind it; the other one stood firm, the inclination of the strata acting as a natural drain. The failing wall was operated upon by boring through it and inserting drain-pipes, reaching 10 feet into the clay, which had the desired effect of letting off the water and preventing any further bulging. To make all sure, cast iron struts were thrown across from one wall to the other. Iron struts are used with great advantage on the North London Railway, and also on the Metropolitan Railway. In the latter case the walls are constructed on the principle of deep piers of brickwork at intervals of 11 feet, having vertical brick arches turned between them backed with concrete. They are carried up straight to a height of 15 feet above the rails, where the struts are placed; above this point the face has a batter of 1 in 8, the back being still vertical. The struts are made in two lengths, bolted together in the centre, and stayed with T-irons, which run longitudinally from one to the other. The feet of the piers are retained in position by brick inverts, backed with concrete.

The material employed in retaining walls must necessarily depend upon local consideration, the necessary qualifications being weight and resistance to crushing. Where stone is very abundant dry walls may be used, as is the case in a wall at Rowsley, sustaining an embankment of the Midland Railway extension to Buxton, about 25 ft. high. There being a quarry in the immediate neighbourhood, it was built dry, of sandstone grit, 11 feet thick at the bottom, 5 ft. 6 in. at the top, and with a batter of 1 in 4. Where mortar or cement is used the work must not be exposed to great pressure until it is well set. In the late extension of the Surrey Docks, owing to the sudden lowering of the water, portions of one of the walls (although 20 ft. thick in brick and concrete) bulged to such an extent as to necessitate reconstruction.

Concrete, from its cheapness and monolithic character, is a first-rate material for retaining walls; but, as it disintegrates upon exposure to the weather, it should be protected with a facing of brick or stone (good care being taken to insure a perfect bond), as in the extension of the London Docks, at Shadwell, or by iron piling and plates, as in the Brunswick Wharf, at Blackwall. Mr. Mallet's buckled plates are well adapted for this purpose.

THE LEONINE CITY, VATICAN.*

ROME may be considered as three distinct cities, each enclosed by its own walls of as many distinct ages; the largest of these, including the great bulk of the population, occupies what was in olden time the Campus Martius, and the Seven Hills; its walls, beginning at the Tiber, near the Flaminian gate, and ending again with the river below the Porta Ostiensis, date from the period of the division of the empire between Arcadius and Honorius, towards the close of the fourth century. I remember some years ago to have read a paper on the walls and gates of this seven-hilled city, and I have no intention now to recur to anything on that side of the Tiber. Let us call this *Urbs Roma*, or "the city."

The next portion, the Trastevere, is the Southwark of the metropolis. The walls of Honorius originally enclosed little more than the space covered by the Arx Janiculensis. They are now partly demolished and partly in ruins, being rendered useless by the modern enclosure of Urban VIII., A.D. 1630. Those Barberini walls begin near the Porta S. Spirito, and run up to the long ridge of the Janiculum, enclosing the extensive villas Lanti and Corsini, culminating at the Porta S. Pancrazio, and descending again to the Porta Portese. They very well parried the siege of Rome by the French army in 1848, and are now prepared for another in case of necessity; but neither do I intend to speak of the Transiberine city which is defended by the walls of Pope Urban VIII. But there is yet a third city which has its own walls and gates, and claims a history of its own, belongs especially to the Popes, monopolises the Vatican Mount, contains the great temple of Christendom and the palace of the sovereign pontiff, and, though not more than three miles in circuit, may yet be destined to become an empire of itself. This is the city to which now all eyes are turned, and on which the eyes of Victor Emmanuel are fixed. I propose to offer you a history and description of this papal or Vatican City.

The appellation of Janiculum may be applied to the whole range of hills extending from the Montorio to the Monte Mario, inclusive; but the "Vaticani Loci" do not properly reach beyond the vineyard of S. Oafrizio; the heights which rise behind the basilica of St. Peter and above the pontifical palace form the "Collis Vaticanus." In the days of Imperial Rome, this hill was covered with vineyards, producing a very bad wine, which they called Vappa. If etymologists may be trusted, it would seem that the spirit-rappers and table-turners held their happy mediums here, for both Aulus Gilleus and Sextus Pompeius combine to persuade us that the hill derived its name from *Vates* or *Vaticinia*, which just means the fortune-tellers and necromancers of ancient days, whose progeny will never die out as long as credulity and ignorance survive to feed them. The hill of prophecy, however, was accounted the most unhealthy district beyond the Tiber, where, as Tacitus tells us, the mortality was the greatest. The tradition that St. Peter was both crucified and buried in the Vatican, invested this once sickly region with a sanctity which we need not seek to disparage. As early as the age of Constantine, a large temple in the form of a basilica was erected where Anaclethus, Bishop of Rome, had constructed his oratory over the traditional sepulchre of St. Peter, A.D. 306.

But this basilica stood alone, and was not enclosed, nor any part of the Vatican hill, until the year 848; and I am now to tell you how this most magnificent suburb of Rome first became a city. After the dominion of the Goths and the ravages of the Lombards had ceased to keep Rome in terror, a new danger arose in an unexpected quarter. The Saracens, who had established themselves in Sicily, infested the coasts of Italy, and, ascending the Tiber, plundered the basilicas of St. Paul and St. Peter, which lay open and exposed to their depredations. Leo III. began, in his pontificate, to build walls about St. Peter's, but it remained for the magnanimous Leo IV. to effectually fortify Rome against the incursions of the infidels. About the year 731, we find something like a republic established under the influence of the Bishop of Rome. It was entitled the Roman Duchy. France, in the persons of Charles Martel and Pepin successively, saved Rome, and established the Popes Stephen II. and Gregory III. in their temporal power; and from that time the Popes began to act for themselves as sovereigns, until they were overpowered by the successors of Charlemagne. The first great and independent work of a secular kind executed by papal power was the city I am about to describe, and which the Pepin of the present day still defends, with all it contains, against the Lintprands and Garibaldis of the nineteenth century. In the year 848, then, Leo IV. resolved to restore the walls of Rome, especially on the right bank of the Tiber. He rebuilt fifteen of the ruined towers, and that the work might be done speedily he himself visited the walls sometimes on horseback, sometimes on foot, and after putting the old walls in a proper state of defence, turned his attention to fortifying the Vatican Basilica. The revenues of the Duchy of Rome were not sufficient. He applied to the Emperor Lotharius for help, and his majesty responded, not by sending him an army to take care of him, but ordering many pounds of silver to be paid to the enterprising pontiff. Not knowing how soon the Saracens might renew their destructive invasions, he pushed on his works; sent for labourers from every city, farm, and monastery within the Roman duchy, and in four years the walls were complete, and this was very properly called the Leonine City, a name which was preserved until the sixteenth century, and is still used to designate the city of the Pope. I will not stop to describe the ceremonies with which the walls and bulwarks of this new city were inaugurated. Bishops and priests, and all orders of the clergy, with bare feet, and their heads sprinkled with ashes, made the circuit of the walls, singing litanies, psalms and hymns, and canticles, while the cardinal bishops sprinkled the walls with holy water. Anastasius, who lived near that time, has preserved a record of the solemnities, and has told us of three gates. One was called S. Peregrino, because it faced the church of that name; the other towards the Fort S. Angelo, was called Posterula, or Little Gate S. Angelo; the third was also a posterula, called Saxonum. The ceremony of inauguration ended in a liberal distribution to the Romans and strangers who were present on the great occasion. This passage of Anastasius is valuable as furnishing an example of the ceremonies which were observed in the dedication of cities in the ninth century. Now, of those original walls dedicated in the year 852-3, two sides of the quadrilateral figure remain almost entire, and with the aid of Bufalino's plan of Rome, published in 1551, we can see what the Leonine City was before it came into the hands of Sangallo, under Pope Pius IV. The first side, one of the long ones, is almost entire, except where it is broken by the Pontifical palace; the portion of it which runs from the Fort S. Angelo to the

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post*. Gold watches, 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enable persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 & 34, Ludgate-hill, 46 & 47, Cornhill, London, E.C. Established 1749.

* Read by the Rev. R. Burgess, D.D., before the Institute of British Architects, on the 31st ult.

palace, was transformed by Alexander VI. (Borgia), into a corridor of communication between the Vatican and the Castle. Here we place the first angular points of the Leonine City. Resuming the line of wall after its interruption by the invasion of the Vatican staircases and corridors, it runs up to the summit of the hill, and terminates in the round picturesque tower, called the Torre dei Venti, which is now enclosed within the enlarged circuit of Pius IV., which we will soon describe. The whole length of this first side is 916 geometrical paces. From the tower the walls turn at a right angle, and continue in a straight line until they are joined by the modern walls of the Porta Pertusa, where another round tower, not so conspicuous as the former, rises, and indicates the third angle. This western side of the quadrilateral is only 1,000 feet in length, equal to 250 geometrical paces. The third side, nearly parallel with the first, is now, in a great measure, thrown down, but there remain vestiges of it which may be traced for about 250 feet from the Porta Pertusa; and again at the Porta Cavalleggeri, where the walls coincide, and, in fact, form part of the present circuit. The construction called Saracenic is immediately recognised as being similar to all the rest of these Leonine walls. The Saracens impressed their hated name upon a kind of masonry which really existed long before these fierce warriors were heard of. Specimens now exist in Hadrian's Villa, near Tivoli; it consists of small parallelopipedons of stone. In the Leonine walls the stone is granular, and was no doubt taken from some of the quarries in the neighbourhood. Another specimen of this *opus saracenicum* is to be found near S. Sabina, on the Aventine Mount, the work of Pope Onorius III., in the thirteenth century. This is a considerable improvement upon the *opus mixtum* of which I exhibit two specimens; the one is taken from the interior of a sepulchre on the Via Nomentana, near the bridge over the Arrio, the other from the Circus on the Via Appia, to which I hardly venture to give a name lest some disputatious antiquary may rise up and contend for the traditional name of Caracalla. We now pursue our wall, rendered invisible by more modern works, until we come to the Tiber, behind the church of S. Spirito, and at the bridge now destroyed to its foundations, commonly called the "Pons Triumphalis," but which is marked in Bufalino as "Pons Vaticanus;" and if ever it should be rebuilt for the mutual convenience of the King of Italy and the Pope to confer together on secular matters I hope the name "Pons Vaticanus" will prevail: and no triumph for either King or Pontiff. The length of this third side measures 4,000 feet, or 1,000 geometrical paces, and is, therefore, longer than its parallel by 334. Here, however, must be found the third angle of the city of 852, and the fourth side, which completes the figure, measures, like its parallel, 1,000 feet. The result of these measurements will give to the first Papal city a circuit of nearly two miles, and within this space nearly 105 popes in succession were content to live before Pius III. began to think of enlarging the tent to make more room for St. Peter's shrine, and for the comfort and splendour of his successors.

The Leonine City had originally, like the City of Romulus, three gates; and if I should attempt to fix their several positions, and insist upon names, it would be as weary a chase as it has been after the gates of the original imperial city. It is remarkable how antiquaries and topographers get puzzled about the entrances into old cities. What battles have been fought over the gates of Servius Tullius! Who can reconcile the walls of Honorius with the walls of Aurelian? The common-sense solution of the question seems to be this, that when the number of inhabitants increased there wanted more accommodation for going out and coming in. On the return of the Popes from Avignon the Leonine City received continual accessions of inhabitants, they settled in the part nearest the river, and beyond the ditches of the fort; the three old gates were insufficient, and one of them, at least, inconvenient. More were added with new names until the old nomenclature, which seems to have little meaning, was swamped; it cannot be of much consequence to investigate this dry subject which no ingenuity can make moist, but by reference to Bufalino's plan of Rome, we can with comfort see all the gates as they then existed, that is before the Papal City assumed the outlines it has now preserved since the days of Pope Pius IV., 1562, at that period when Pope Paul III., (Farnese), had done his part, there were six gates and two posterns in use, and all that part of the city which lay between the Forts Angelo and the Piazza S. Pietro was thickly inhabited; but it still remained as a separate city. The Porta S. Spirito, which led out into the Lungara, was a full mile distant from the P. Settimiana in the walls of Aurelian, and all that lay between was unenclosed, whatever alterations or additions were made by the popes, from Alexander VI. (Borgia), to Clement VII. (Medici), they were all confined to the old Leonine City, until at length Paul III. commenced and Pius IV. completed the present walls and bastions, and Sixtus V., 1588, erected the whole into a 14th Ward or Rione of Rome, called until this day the Borgo.

The Leonine City, from the very strength of its bulwarks, seems to have attracted the besiegers. Only forty-four years after their erection Arnolfus, Emperor of Germany, came against the city, and took it by assault. Pope Formosus was obliged to comply with the Emperor's demand, which was that he would crown him as Charlemagne had been crowned nearly a century before, and, having obtained that blessing, which other emperors of the present day would like to have, Arnolfus returned home after a residence of fifteen days in Rome. A second capture of the city took place in 1063, effected by a nocturnal assault of the Anti-Pope Cadolo. Henry IV. and the ferocious Robert Guiscard, in 1084, did much damage to the Leonine City. Frederick Barbarossa did not improve it. In 1157 the Roman Senate found it necessary to make a general reparation, which lasted until Pope Nicolas V., 1452; but the last and most disastrous attack upon this ill-fated city was that of the Constable Bourbon, in 1527. The Colonnas, with the aid of the Viceroy of Naples, got possession of the city on the 22nd of September, 1526, and sacked the palace and Vatican Basilica, and a considerable portion of the Borgo, as fiercely as either Vandal, Goth, or Saracen. This war was caused by Pope Clement VII. having allied himself with the French against Charles V. The Duke of Bourbon was the *condottiero* of the armies of that emperor. Having marched against Rome, he assaulted the Leonine City on the 6th of May, 1527, and, in attempting to scale the wall near the Porta S. Spirito, he was killed by a ball from an arquebus, on the spot; the troops turned towards the main city, passing the Ponte Xysto; they plundered the houses of the inhabitants, putting to death several thousands of them, and committing the most unheard-of atrocities. The booty was said to amount to the value of six million pieces of gold. This was the most calamitous event that ever happened to Rome. Its horrors are described by Guicciardini and others, and the details of the assault upon the Leonine City acquire additional interest from the quaint but lively description of Benvenuto Cellini. He was an eye-witness of the siege, and it is even said that the ball which struck the Bourbon

was shot from the hand-gun of Benvenuto Cellini. He ended by believing the story. This was the last siege and sack of Rome until 1848, when the proceedings were milder, and the defenders properly killed, according to modern improvements; and it is not a little remarkable that those two calamities, separated from each other by more than 300 years, should both have arisen from the French assisting the Pope; but there is yet a Bourbon in Rome to renew the sorrows of 1527.

When Sir Walter Scott was in Rome, a little time before his death, it was observed that he took little interest in the ruins of ancient Rome, but was delighted with his visit to the Bracciano Castle; but that which most excited his curiosity was to find out the spot where the Duke of Bourbon was killed in scaling the walls. I believe they took him altogether to a wrong place, and, instead of showing him the Porta S. Spirito, led him to the corridor of Alexander Borgia, near the fort S. Angelo.

We are now prepared to contemplate an extension of the Leonine City, which, properly speaking, should cease now to be called by that name, because all that remains of those old Saracenic walls is found within the subsequent works of Sangallo, and, having lost their original use, are now become the dusky but picturesque ornaments of the Papal gardens.

Paul III. was pope from 1534 to 1549. He resolved to surround the Leonine City and the Vatican with new walls, and he committed the great work to Antonio da Sangallo; he commenced the fortifications on the side of the Porta S. Spirito, but a dispute having arisen between the engineer and the architect, Michel Angelo, the work was interrupted, and was not completed until the reign of Pius IV.; indeed, the Porta S. Spirito still remains unfinished, *in memoriam*, as if it was meant to immortalise the proverb—"Every man to his trade." Vasari, who was, of course, on the side of his master, Buonarroti, in the quarrel, has narrated all the circumstances in his "Life of Michel Angelo." (Volume XIV. of his works.)

"Pope Paul," he says, "had made a beginning to fortify Borgo, and he brought together many signori to meet Antonio da Sangallo, and desired Michel Angelo also to be present, for he was aware that the fortifications made about the Mount St. Miniato, at Florence, had been planned by Michel Angelo. After much disputation he was asked to give his views, and although he was of a contrary opinion to Sangallo and several others, he frankly told them all that he thought. Upon this Sangallo said to him that his business was sculpture and painting, not fortification. Michel Angelo replied that he knew very little of the art of sculpture and painting, but as to fortification he had made it a study for a long time, and that, added to his practical experience, led him to think he knew more about it than Sangallo and all his friends put together. At the same time he pointed out, in presence of the whole meeting, several mistakes in Sangallo's plans; and the alteration got to such a height that the Pope was obliged to impose silence upon them both. And not long after, Michel Angelo brought his designs for the fortifications of the whole Borgo, and took care of all that was already planned and done after, and this was the reason why the bastion and great gate of S. Spirito, which was near the commencement, remained unfinished. As far as we can learn from this, it would appear that the dispute was as to the merit of the invention; the science of modern fortification was then in its infancy; none had been created since the invention of gunpowder; the upright towers connected by curtain walls were no longer able to resist the new engines of war; and although the quarrel between the two great geniuses of the day had suspended the works in the Vatican, Pope Paul III. recompensed Sangallo by employing him to raise the splendid Bastion which now exists between the Porto Appia and the Ostiensis, to which Sangallo gave his name. Engineers of course repair to study this first specimen of modern fortifications, and not the less all that portion of the city walls which defend the south part of the Aventine Mount, and secure the gate of St. Paul. The bastion of S. Gallo is worth a sketch. Sangallo died in 1546, leaving Michel Angelo a clear coast, who lived until 1563. We may infer from subsequent events, that these two first-rate men were reconciled before the final separation; they were both employed about the Farnese Palace. Nevertheless the fortifications round the Leonine City stood still for near a quarter of a century, and Sangallo had no more to do with them. Pius IV. took up the suspended work of his predecessor, impelled thereto by the incursions of the Turks, who had at that time begun to ravage some parts of Europe, and threatened destruction to Rome itself. On the 8th of May, 1561, the Pope laid the first stone of his new walls, and adopted the plans of Michel Angelo, now near the end of his career. It may not be uninteresting if we pause here for a few moments to look at the modern distinctions of kindred professions,—distinctions from which no doubt the arts and sciences have gained greatly. It is evident that in the revival of the fine arts of the Cinque Cento, great masters often invaded the provinces of each other. Raffaele is put down among the architects, so is Peruzzi of Siena; several others figure in the lists of both painters and sculptors. Michel Angelo, as we have seen, planned the fortifications of the city of Pius IV., and Sangallo designed the Palazzo Farnese, but neither of them carried their own plans into execution. Neither of them was the right man in the right place; but there can be little doubt that if the two great rivals in civil engineering (before the art was well understood both of them equally engaged by Paul III., as architects), had lived at this day, I have no doubt Michel Angelo would have had the Great Exhibition, and Sangallo would have got Portsmouth; but, as I have said, professional distinctions were not then very much defined, and we must admit that Michel Angelo was a striking instance of an Engineer and an Architect in one. But this anomaly in professional services comes down much later than you imagine. Lord Macaulay tells us that as late as 1685 most of the ships that were afloat were commanded by men who had not been bred to the sea. No state, he says, ancient or modern, had before that time made a complete separation between the naval and military services. Pompey and Agrippa fought battles by sea as well as by land. At Flodden the right wing of the victorious army was led by the Admiral of England; and even after the Restoration the same system was followed. Great fleets were entrusted to Rupert, a daring cavalry officer; and when General Monk once wished his ship to change her course, he moved the mirth of the crew by calling out, "Wheel to the left." There were naturally some professional blunders when men undertook too much. These were days in which neither the art of war nor the art of navigation made it so necessary to draw a line between two professions which had hitherto been confounded; but now one, at once and for all, is enough to occupy a single mind. The arts of peace as well as the arts of war now claim an undivided attention for their respective departments, and the only way to succeed in these days is to stick to one's text. There may be a comprehensive genius who may rear with equal success a Palladian palace or a Russian

fort; but it happens to few, and, as a general rule, it is safe to be warned by the venerable axiom, *Ne sutor ultra crepidam*.

Paul IV. died in 1556—that is, five years after resuming the left-off walls of his predecessors; but the work was not completed until Pius V. He employed in the finishing a number of Turkish captives taken at the battle of Lepanto, 1571, but the circuit never went beyond the gate of the S. Spirito. As it stands now, firm and unshaken, it is three miles round. The gate near the Fort S. Angelo is closed. The Porta Angelica gives access to the Borgo from the roots of Monte Mario and the north. The Porta Pertusa—called also the Viridaria, because it led into the papal gardens—is now shut up. The Porta Fabrica, so called because it was convenient for approaching on the southern side of the Basilica, and the Cavalleggeri, because it was near the quarters of the Pope's body-guard. Such is the present circuit of that magnificent city, marked out with admirable prescience just three centuries ago to be the seat of an empire which none can envy, and an abode of splendour which all must admire. The city I have described is complete in itself; it has thirteen principal streets, besides lanes and alleys, and open spaces; it contains twenty churches or chapels, independent of sisterhoods, fraternities, and charitable institutions; it has eleven palaces, ample and sufficient for foreign ambassadors. It contains the never-ending compartments of the great museum, the Pontifical Palace and gardens—

"The dome, the vast and wondrous dome,
To which Diana's Temple was a cell."

It may still have its Girandola and two fountains, with the courts and offices of the Holy Inquisition, and the magnificent colonnade, in the centre of which stands the monolith we want to imitate; and there is a peaceable and devoted population of more than 3,000 souls loving to dwell under the shadow of the Loggia Vaticana for an occasional benediction. Who, after having known the vicissitudes of all the Puses up to the eighth, would not desire to be the ninth. Pius the Third, Fourth, and Fifth consumed their days in building walls and fortifications. Brasci Pius VI. was driven, for protection, to Vienna; Pius VII. was a captive in the hands of the first Napoleon; Pius VIII. was in Paradise in two years; but the last of the name has had the offer of a city and vast revenues, and no one to interfere with the canonizations of twenty-five Japanese martyrs; but these matters do not belong to us, who do not come here for building walls against which to run our hands, but to draw a line of ancient fortifications which will secure all contending parties within their own limits.

There stands within this city, of which we have now given the history and description, an object which, like others of its kind, has recently acquired additional interest; of course, I mean the obelisk in front of St. Peter's. As we are, by favour of the Institute and its generous President, to have a reprint of a paper, and discussion thereupon, with regard to obelisks at Rome, it would be unpardonable in me if I were now to inflict upon you a dissertation by way of appendix to my *Leone City*. But a few words, perhaps, will be allowed me in collecting all the information we can as to the mode of erecting those monoliths which are now standing. Perhaps the Vatican obelisk affords most for our purpose. First, it is the largest mass of granite at Rome, except one, that of the Lateran; its weight was calculated at 331 tons. The length of the shaft is 80 feet 9 inches, the width at the base 8 feet 4 inches, contracting to 5 feet 8 inches at the pyramidion; if the basement and ornament at the top be included, the entire height is 127 feet 6 inches, which, I presume, will be about our affair. In the next place, it is no a genuine Egyptian obelisk; it has no hieroglyphics upon it; and we are not aware of the existence of any unsculptured obelisk ever erected in Egypt. The reading of Pliny is not received by critics; the text is manifestly corrupt, and there can be little doubt but this monolith was cut by order of Caligula, in the quarries of Syene, and dedicated to the memory of Augustus, but actually set up on the Spina of the Circus of Nero. From that destination it was never moved until Sextus V. had it conveyed to where it now stands; four months were consumed in moving it 300 yards; you all know how and by whom the great work was effected. We shall want a Fontana and a vast quantity of ropes, when we have found the granite mass. We cannot hope to reach the large grained red quarries of Syene, in upper Egypt. You are aware that Syenite is distinguished from common granite by having hornblende in the place of mica; it will be impossible, perhaps, to obtain the warm red granite which we generally associate with the idea of an obelisk, but if any of our native quarries can produce a fair specimen of the obelisk material, and any of our native geniuses set it up in its place as a memorial to all generations, we shall be proud of the achievement, and successive generations will learn in that stone that "the memory of the just is blessed."

STONE-CUTTING MACHINE.—The *Arbroath Guide* describes a machine, which is to put an end to masons' strikes and nine hours' movements:—There is now in process of completion in the establishment of the Messrs. Munro, founders and engineers, Arbroath, a machine which, it is believed, will entirely revolutionise the mason work of the present day. It is to perform with speed, accuracy, and regularity of finish nearly the whole of the mason work—hewing, dressing, &c.—now executed by hand. It will dress and polish stones, and do almost everything appertaining to plain masonry, "giving to ashlar work an ornamentation quite unique." This machine is an amplification and completion of the inventor's idea that seven years ago found expression in the ridge-dressing machine, which was then patented; but only two of which were made, as Mr. Hunter saw and has been working out this new and greater scheme.

STAINED GLASS.—ST. STEPHEN'S, WALDBROOK.—Four of the larger and fourteen small windows in the church have recently been filled with stained glass by Mr. Gibbs. The four large windows consist of two at the west end, on each side of the organ loft and entrance, and two on each side of the communion-table. The smaller ones fill up the oval windows. The subjects of the new windows are illustrative of the chief acts and sayings of the Saviour. The large windows have the Nativity, the Baptism, the Crucifixion, and the Ascension, and contain figures the size of life. The smaller pictures in the ovals represent, on the south wall, the Miracles, and on the north the Parables, and include Turning the Water into Wine at the Marriage-feast, the Raising of Jairus's Daughter, the Resurrection of Lazarus, the Miracle of the Loaves and Fishes, the Healing the Sick, Walking on the Water, the Prodigal Son, the Pharisee and the Publican, and the Good Shepherd.

ROOD-LOFT, ST. DAVID'S CATHEDRAL.

THE Cathedral of St. David's, though not equal in size to many of the others, and comparatively little known, is equal to most of them in interest, though, perhaps, of a melancholy kind.

Few scenes can be more solemnly interesting than this on an autumnal evening, when the sun is just setting, and the traveller, having passed through the humble village, dignified with the name of a "city," finds himself on the brow of a rugged hill, and sees suddenly close below him a mass of buildings such as he has never seen around any other cathedral, and of which his imagination never dreamt, but all of which appear to be struck by the hand of time, and to be fast mouldering into decay.

In the centre rises the massive tower of the cathedral, but with the eastern portion of the building unroofed, and its aisles and walls open to the wind and rain. On the left, and surrounding the whole precincts, is the wall of the close, with its solid gateway still entire. On the right is another building, entirely in ruins. This is the College of St. Mary; and still further is seen what must once have been a magnificent pile, the Episcopal Palace, but now, like all the rest, entirely in ruins. Beyond all this are the rugged and sterile hills stretching towards St. David's Head, and over all the ocean itself.

It is melancholy to look on so much ruin, and one naturally feels inclined to inquire into the history of the rise and fall of edifices reared at so much cost on so desolate a spot, and standing, as they do, on the very confines of cultivation.

We have not space here to enter into this history, and we only give an illustration of a small portion of the building as a specimen of the architectural interest which attaches to it.

The rood-loft, which, as usual, divides the nave from the choir, is of two different dates, the principal portion—i.e., the central archway and the southern wing—being the work of Bishop Gower, between 1328 and 1347. This is very rich and beautiful decorated work. The *skeleton* tracery under the central arch is very remarkable. The tomb of the bishop stands within the southern arches. The northern portion is of much plainer character, and of earlier date, and is, no doubt, a part of the original screen as it stood before Bishop Gower's alterations.

The costume of the heads in the cornice under the arcade is of thirteenth-century date. The screen is surmounted by a cornice of oak, which was added in 1847; but the panels, which are filled with Perpendicular tracery, are the remains of older work, and the springings for fan tracery between them show that it must have originally been far different to what it now is. It is, however, suggested that this woodwork may have been brought from elsewhere.

A very careful and minute description of the rood-loft will be found in Messrs. Jones and Freeman's "History of St. David's," one of the most complete and valuable histories of a single cathedral which has ever been published.

PROGRESS OF THE METROPOLITAN MAIN DRAINAGE WORKS.

AT the ordinary meeting of the Metropolitan Board of Works, held at the offices, Spring-gardens, on Friday last, Mr. BAZALGETTE, the Engineer-in-Chief of the Board, reported that the continued and heavy rains which have occurred during the past month have been very unfavourable for the execution of the Main Drainage Works. The progress made by Mr. Furness upon the Northern Outfall Contract has, notwithstanding, been considerable, about £22,000 of work having been executed under this contract since the last monthly report made to the Board. The iron girders are in course of construction over the river Lea at Bow and Barking, and the North Woolwich Railways and the plates are being riveted for some of the other bridges. The cutting through the Eastern Counties Railway embankment, the difficulty of which work is increased by the almost continuous passing of the heavy traffic over it, progresses slowly but safely, and the two outside permanent brick piers are now carried up to the requisite height for the support of the rails, which now rest upon temporary timbers. The contractor's railway by the side of the permanent work has been extended on from Plaistow to the Stratford-road, and the concrete embankment has been thereby pushed forward between those points. The brickwork in the intercepting sewers and the foundation piers and arches through the marshes and peat subsoil, have made considerable progress, and the total value of the work now executed is about £232,000. The general character and management of this work is very creditable. The Northern High-level Sewer, which has been some time finished and in operation, continues to perform its duty satisfactorily, and the engineer has recently settled the accounts for extras and deductions on this work. Messrs. Brassey and Co. have now completed about 25,300 feet of the Middle-level Sewer, varying in size from 4 feet by 6 feet to 12 feet by 9 feet in diameter. They have also completed about half the sewer under the Regent's Canal, and, from the precautions adopted and the care taken in the execution of the work, there is every reason to expect that they will complete this difficult portion of their contract without any further accident. They have, moreover, made good progress with the tunnel under Oxford-street, and are now preparing to remove their shafts and observatories so as to leave the thoroughfare free from obstruction during the summer months. The total value of the work done by them is about £116,000. The weirs, overflows, and connections of the junction of the Ranelagh Storm Overflow with the Middle Level Sewer in the Uxbridge-road, for the reasons stated in the engineer's last report, progresses slowly, but the work is of a very substantial character, and amounts to about £28,300 in value. All obstructions have been removed from Hyde-park and Kensington-gardens, and the ground has been levelled and grass sown. On the Southern High-level Sewer, Messrs. Lee and Bowles have constructed about 8½ miles of sewer, at an estimated cost of £154,000, but this contract has suffered considerably from the effects of the heavy rains, both by floods in the Broadway, Deptford, and by the falling in of the bricks of the trenches, at Dulwich, and at the junction of the south branch with the main line, but it is probable the

ROOD-LOFT, ST. DAVID'S CATHEDRAL.

experience thus gained will lead to the adoption by the contractors of precautions which may for the future prevent the repetition of similar disasters. On the Southern High-level Sewer Extension, Mr. Pearson has constructed 1,035 feet of sewer, at an estimated cost of £1,531. Mr. Webster will shortly complete the Southern Outfall Sewer, and as he had finished all the difficult portions of the work, there was little to be reported respecting it beyond the fact that it had been executed in a manner which has given general satisfaction in the localities through which it passes, and reflects credit upon the contractor. The total value of the work executed is about £284,000. Messrs. Aird and Soa have made fair progress with the Deptford Pumping station, and the engine-house, and hoists have been raised from 3 to 4 feet above Trinity high-water mark; the cross sewers and penstock chamber are completed, and the penstock gratings fixed. About 4,000 feet of iron pipe connections under the creek are laid on 566 feet of double line of the Low-level Sewer, constructed each 7 feet in diameter. These works, together with the river wall, coal sheds, and other works in connection therewith, amount to about £68,500 in value. The progress of the Southwark new street is now more satisfactory, some of the property which formerly obstructed the works having been removed, and the paving near to the High-street is progressing.

METROPOLITAN BOARD OF WORKS.

Improvements.—The Board at its last meeting, held on Friday, received a report from the Works and Improvements Committee, recommending that the Board do contribute one-third of the cost of effecting a public improvement in the Grauge, Bermondsey, to be carried out by the Vestry of Bermondsey, by the widening of Cow-alley, as shown upon the plan produced to the Committee, estimated at £265 11s. 4d., exclusive of professional charges; such contribution not to exceed £88 10s. 5d., and that such amount be paid to the Vestry of Bermondsey, on a certificate from the architect of this Board of the completion of the work.—Agreed to.

Also recommending that the Board do contribute one-half of the cost of effecting a public improvement in Purim-place, Cambridge-road, to be carried out by the Vestry of Bethnal-green, as shown on the plan produced to the Committee, estimated at £270, exclusive of professional charges; such contribution not to exceed £135, and that such amount be paid to the Vestry of Bethnal-green, on a certificate from the architect of this Board of the completion of the work.—Agreed to.

The Building Act and General Purposes Committee recommended that the application of Messrs. Morris and Soa, for the consent of the Board to the erection of an addition to an existing closed porch at No. 6, Manor-terrace, East India-road, Poplar, as shown upon the plan accompanying the application, be not granted.—Agreed to.

Fireproof Construction of Stairs.—Amongst the items in the agenda paper of the superintending architect was the following:—"St. James's Parish.—Her Majesty's Theatre.—Reference by Mr. Lee, architect, and Mr. Kerr, district surveyor, as to fireproof construction of stairs and accesses to concert-room."—This case came before the Board by way of reference. It appeared that the proprietor of Her Majesty's Theatre was desirous of making an additional (wooden) staircase to the concert rooms, but the district surveyor required that it should be made of fireproof materials. The superintending architect agreed with the district surveyor. Mr. Lee said that if fireproof construction of the proposed staircase was insisted upon, it would probably not be made at all, owing to difficulties in the way and the additional expense involved. The Board, however, adopted the report of the superintending architect, that the staircase, if made, must be made of fireproof materials.

BENNETT'S SOLUTION FOR CEMENTS.

WE have received a specimen of Portland cement treated with Bennett's "indurating and quickening solution for Portland and other cements." Without some experience of its use it is not possible to form a just idea of its value, but if what is said of it be true, it cannot fail to become largely used.

The inventor says that it produces effects upon cements generally, and Portland cement in particular, most remarkable and invaluable in its results, and that the objection that after the lapse of a certain period from the time of manufacture cement becomes unfit for use, or "dead," as it is termed, is overcome by the patented solution, which restores to the cement its virtue and to the owner its value. This solution, moreover, possesses qualities for hardening the cement when set, and bringing out castings with sharper outline than is effected by the ordinary methods. But of all cements to which it may be applied, to Portland it appears to render the most important aid, for with this cement it entirely does away with (providing the cement be of good quality and colour) the only objection that can be urged against it, namely, the length of time it takes setting, for by mixing the solution according to the directions given, in varying proportions with the water used, the cement can be made to set in any required time at the option of the user. The patentee reckons the saving of time by the use of his invention to be not overrated at 100 per cent.

For assisting the hydraulic properties of cements this solution is said to be extremely efficacious, setting cement under water in fifteen minutes if needed.

For plastering purposes 1 quart of the solution is mixed with 40 gallons of water; for hydraulic works, 1 quart of the solution to 20 gallons of water; and for castings and artificial stone, 1 quart of the solution to 30 gallons of water is recommended.

PREVENTION OF ROTTING OF WOOD.—*Herapath's Railway Journal* prints the following:—"To prevent posts and piles from rotting, the following coating has been recommended, which is the more suitable since it is economical, impermeable to water, and nearly as hard as stone. Take 50 parts of resin, 40 of finely powdered chalk, 300 parts, or less, of fine white sharp sand, 4 parts of linseed oil, 1 part of native red oxide of copper, and 1 part of sulphuric acid. First heat the resin, chalk, sand, and oil in an iron boiler; then add the oxide, and with care the acid; stir the composition carefully, and apply the coat while it is still hot. If it be not liquid enough, add a little more oil. This coating, when it is cold and dry, forms a varnish which is as hard as stone."

HOUSE OF COMMONS.

THAMES EMBANKMENT.

SIR J. SHELLEY having moved for a return of the estimated expenditure for carrying into effect the provisions of the Thames Embankment Bill, distinguishing the cost of the filling-in and the masonry of the embankment, the gross amount of the compensation for wharfage and river frontage, the cost of each approach to the embankment, and of each of the other streets and improvements mentioned in the Bill, including compensation, and all other expenses; also the cost of the low-level sewer, the length of the embankment and of each street, together with a plan of the embankments, streets, and improvements, the hon. baronet contended that the inhabitants of the metropolis ought to have fuller details than they now possessed with regard to a scheme which was estimated to cost a million and a half of money.—Mr. Cowper said the Bill would be referred to a select committee, and the information which the hon. baronet wished for would be best ascertained from the evidence to be given before that committee.—On the motion that this Bill be read a second time on Monday, Sir J. Shelley said he had hoped the Chief Commissioner of Works would have given the House some details as to this Bill. It is proposed to tax the people of the metropolis to the extent of £1,500,000, and he thought there ought to be a good reason shown for the carrying out of the proposition. The subject had been under the consideration of a select committee which made certain recommendations that he thought worthy of consideration. But after Parliament had been prorogued there appeared a Royal Commission to inquire into the matter. That Commission advertised for plans, and fifty-eight were sent in. He (Sir J. Shelley) did not think the composition of the Commission was such as to entitle its recommendations to great weight. The plan which was suggested for adoption proposed to do away with the whole of the wharfage trade of Westminster; but the moment it approached the precincts of the city an entirely different spirit came over it. Perhaps that was owing to the influence of the Lord Mayor. But he contended that it was a most unfair proposal. The effect of the removal of the wharves would be that his constituents would have to pay 2s. to 3s. per ton more than at present for their coals. His constituents were to be asked to pay £300,000 or £400,000 for the filling up of these wharves, and then be mulcted 2s. to 3s. a ton on the price of their coals for, having done so. With reference to the plan itself, he contended that it was a very bad one. It was not one of those reported upon by the Commission, but a plan brought forward by one Royal Commissioner. It was his belief that although the Commission advertised for plans from civil engineers, yet that all the time the one now proposed was ready cut and dried in the office of the Commissioners themselves. That on the face of it was extremely suspicious. Seeing that the plan was entirely contrary to every plan which had been before them hitherto, and all of which went as far down as Queenhithe, and there communicated with Cannon-street, instead of stopping at Blackfriars, and leaving the wharfage untouched; and seeing that this plan did away with the wharfage property down to the Temple, treated with great respect the wharves of the City as far as Blackfriars, and conveniently turned there, giving the city of London a most magnificent street to which the Corporation did not contribute a farthing; considering further the Lord Mayor of the City was at the head of the Commission, he (Sir John Shelley) had a right to ask for further explanation, and to inquire how much of the £1,500,000 was to be wasted in filling up wharves and in making a fine lengthy street through the middle of the City, which street he believed to be entirely unnecessary. His constituents would gladly see the embankment made, because the main drainage scheme could never be carried out without it. The returns which he had previously asked for had been placed in his hands by the First Commissioner but only that day; and under all the circumstances he felt justified in moving, as an amendment, that the House would not proceed further with the Bill until the estimated cost of the works authorised thereby was laid on the table.—Mr. Cowper said that he had no objection to the printing of such a return. The substance of that return he could, however, state to the hon. member in a few words. The estimate for the entire work was £1,500,000—of which £500,000 was for the works of the embankment, the roadway, and the new streets—£500,000 for compensation to wharfingers and others; and the remaining £500,000 for losses arising from the construction of the new street to the Mansion House from Blackfriars-bridge. The length of the embankment would be 1 mile 17 chains and 90 links; of the short streets going into Whitehall, 1½ chains; of the street running from the embankment to opposite Somerset House, near Waterloo-bridge, 34 chains; and of the street from Blackfriars bridge to the Mansion House, 58 chains. With regard to the details of compensation, it would not be fair to the engineer who had estimated that expense to make public all his calculations upon the subject. The Bill would be treated in this respect as a private bill, and the parties interested would have a right to appear by counsel before the select committee. The House would have an opportunity in committee of the house of sifting every detail. With regard to the composition of the commission, two military engineers, Captain Galton and Sir Joshua Jebb, and one civil engineer, Mr. McLean had been selected because of their freedom from any bias, or tendency to bias, in favour of any particular plan; Captain Birstal for his intimate acquaintance with the navigation of the river, and Mr. Henry Arthur Hutt for his skill and experience in the valuation of property. It was also thought desirable to have two gentlemen on the commission to represent the metropolis. The Chairman of the Metropolitan Board had been elected as the representative of the ratepayers, and the Lord Mayor, because it was well known he was particularly well qualified to form an opinion upon the subject. He thought that any decision arrived at by such a commission was far more likely to be satisfactory than one which he (Mr. Cowper) might have recommended the Crown and Parliament to adopt. Under these circumstances he hoped the House would consent to the second reading of the Bill. It was of great importance that no unnecessary delay should take place. The second reading of the Bill did not pledge the House to any details; it would simply affirm the general principle that the produce of the coal duties was to go for the purpose of making the embankment.—Mr. Ayrton said that the object of the hon. baronet the member for Westminster was simply this, that before going into committee upon the Bill the inhabitants of the metropolis should be in possession of the nature of the scheme proposed, about which they had hitherto been kept in perfect ignorance. As now explained by the right hon. gentleman it was not a new scheme, having been proposed two-and-twenty years ago, and rejected by a very distinguished commission, comprising among others the present Duke of Newcastle, Mr. Herries, Sir Robert Inglis, the Lord Mayor, Sir James Knight, and Sir Charles Barry, who called to their assistance Sir W. Cubitt, Sir George Rennie, Sir John McNeill, and other celebrated engineers. The proposed street

to the Mansion House was also an old one, and it was condemned on the ground of the expense being greater than the utility, for it was estimated by Mr. Bunning, the city architect, to cost £1,000,000. He was anxious for the embankment of the Thames, but wished the work to be gone about with economy, judgment, and discretion.—Mr. Locke could not understand why the City part of the embankment should require viaducts, and the Westminster part not. He supposed that the scheme had been planned in the interest of the City Gas Companies; but hoped that the committee would so alter the Bill as to make the embankment the same all the way. As to the proposed street, it ought to be made by the City out of the portion of the coal-tax which it still retained, and which had already built Cannon-street; and a street from thence to Blackfriars-bridge had been begun out of the same fund.—Mr. Cox said if this were a proposition which simply proposed the embankment of the Thames, he should not offer any opposition to it; but the Bill went further, and proposed to make a street from Blackfriars-bridge to the Mansion-house, which he believed would cost a million of money. The object was to obtain a good continuous thoroughfare from east to west, and he believed that object might be better attained than in the manner proposed. Supposing they started from Charing-cross, the first impediment which was encountered was Temple-bar. But why not pull down Temple-bar, then continue the route along Fleet-street, widening one portion of Ludgate-hill, and then they had a fine opening into Cannon-street? Or they might take the through thoroughfare from Oxford-street through Holborn, pulling down Middle-row, Holborn.—The Bill was then read a second time, and referred to a select committee.

THE WELLINGTON MONUMENT.

Lord Lovaine asked the First Commissioner of Works how soon it was expected that the monument of the late Duke of Wellington, in St. Paul's Cathedral, would be finished, and whether the surplus of the sum voted for the Duke's funeral would be sufficient to defray the whole cost of the work.—Mr. Cowper said the artist to whom the commission had been given to prepare the model had received his instructions on the subject in November, 1858. Three years and a half had, therefore, elapsed since the order had been given. The model, however, was not yet completed. He was sorry that so long a delay should have occurred in the matter, but he presumed the time had not been wasted, and that the artist was preparing himself by preliminary study for the better execution of his design. He was not able to inform the House when the model would be ready, while he had no doubt that the sum voted was sufficient for the purpose for which it was intended.

WESTMINSTER PALACE.

On Thursday se'nnight, in Committee of Supply, £32,647 was proposed for the Houses of Parliament.—Sir H. Willoughby asked whether the building account was closed, and whether they must expect to find a sum of £32,000 charged every year for keeping up the building?—Mr. Cowper said the vote was for ordinary expenses, and he did not see how that sum could be materially reduced in future years.—Mr. Kendall said that there were in or about the building some 5,000 gaslights and about 200 argand lamps. Nevertheless, while the expense of the former (which was equal to 7,000 argand lamps) was only £2,500, the 200 oil lamps actually cost £2,000.—Mr. Ayrton said that four statues to sovereigns of this country had already been erected. The four selected had been Charles I., George I., George IV., and William IV. This year two new ones were to be added, and he wished to know to whom the statues were to be erected?—Mr. Cowper said the item of £6,108 for gas and oil was divided between the two. Oil was in use in some of the offices under a contract of old standing, but by the end of the present session of Parliament a new contract would be made, which he hoped would be more economical and substitute gas for oil. Last year the House voted four statues out of a chronological series of twelve. The present vote included two of these statues out of the twelve. He believed the statues to which the present vote applied were the statues of William III., and of Queen Mary.—Sir M. Peto suggested that there should be executed by one of the first artists of the day, and placed in the most prominent position, a statue of the late Prince Consort. He believed the House would gladly vote a sufficient sum in order to obtain the best work of art that could be procured. The country would like to see so fitting a tribute paid to that virtue which has so signally distinguished the present reign.—Sir M. Ridley said that the statues of Pitt, Grattan, and Burke, placed in the hall, were about as bad specimens of works of art as were ever perpetrated. There was no mind, no speech, no thought in them, and he considered that the money paid for them had been thrown away.—Sir J. Paxton inquired whether the sum of £3,000 charged for racks for public records in the Victoria Tower was a concluding vote, or whether it was to be continued.—Mr. Cowper explained that room was required for the records of the House of Lords, and two rooms out of sixty-four in the Victoria Tower had been fitted up for that purpose.

THE NELSON MONUMENT.

Admiral Walcott on Friday drew the attention of the Chief Commissioner of the Board of Works to the incomplete state in which the base of the Nelson Monument was suffered to remain, and in doing so stated that nearly four years had elapsed since the monument had been left in its present incomplete state, though the then Chancellor of the Exchequer obtained a vote of £6,000 for its completion, which had been entrusted to a sculptor, but to a highly eminent artist. There could be no doubt that foreigners visiting London during the forthcoming International Exhibition would consider the state of the monument to be a national disgrace. He regretted that a statue which was intended as a matter of respect and admiration for Lord Nelson, and one which might quicken in his successor a desire to emulate his glorious career, had not attained even its present condition without the aid and munificence of a foreign nation. England might not have buildings as splendid or galleries as rich as some continental nations, but she should show that she possessed the power and the desire to regard with reverence the memory of those who deserved well of their country. It was most discreditable to see in the grand square of this capital, in this great thoroughfare, leading to the wealth of the metropolis and the chambers of the Legislature, an incomplete memorial of one of their greatest naval heroes and admirals.—Mr. Cowper in reply greatly deplored that that monument was unfinished. The order for the execution of the lions was given in 1858 to Sir E. Landseer, a man of great genius, quite competent for the task. But genius, he supposed, was not always to be commanded, and Sir E. Landseer had not yet been able to satisfy himself as to the work of art which he was to place upon

that monument, and could not yet name any time when the lions, which were now in hand, would be completed. All he could say was that Sir E. Landseer was now very accurately studying the habits of lions, and was to be seen in the Zoological Gardens, making himself thoroughly acquainted with their attitudes. It was to be hoped that all this delay would secure our ultimately having a work of art of still greater perfection than if it had been executed as rapidly as had been expected. Sir E. Landseer was quite aware that a great monument was in a very imperfect state while the portion of the work entrusted to him remained unfinished.

CHURCH BUILDING.

Kent.—*St. Mary Cray Parish Church.*—This church, which has been closed about nine months for the purpose of undergoing a general reparation, was reopened on Thursday se'nnight by the Archbishop of Canterbury. The work includes new pewing entirely, floor raised by a bed of concrete, new tiling, new roof over nave, gallery removed and tower thrown open, two chapels restored (one seated for the congregation), organ repaired, new stonework to six windows, new vestry and porch, churchyard levelled and old tombs lowered, and a new buttress. Mr. Edwin Nash is the architect, and the works have been executed by Mr. Hollidge, of Norwood. The cost has been about £1,800.

Yorkshire.—*Darlington Parish Church.*—A meeting was held on the 28th ult., with a view to obtaining the necessary faculty for carrying out the proposed restoration of the parish church of Darlington. The General Committee reported that the total subscriptions amounted to £3,134; that they had, with the sanction of the subscribers, confirmed the appointment of Mr. G. G. Scott as architect; that the number of sittings in the church as proposed to be altered would be 1,004, whereas there are now only 966; that the operations to be immediately carried out, in regard especially to restoration, would be £1,550, to repewing, £1,700—total, £3,250; that operations which will admit of delay would cost £1,050; and that other objects estimated for by Mr. Scott, but which they did not at present contemplate proceeding with, would cost £1,000. A resolution was submitted to the meeting, sanctioning an application for a faculty, and carried.

Ireland.—The following items are taken from a recent number of the *Dublin Builder*. The foundation-stone of St. Mary's, Dargle, was laid on St. Patrick's Day. The structure will consist of a nave and chancel, terminating in a semi-circular apse; tower, with low pent-house roof and embattled parapet at west end of north aisle; north porch and sacristy. The dimensions are 136 feet 6 inches by 65 feet in the clear, and the style is the Early Pointed. Messrs. Aitken, Crosbie and D. Cotter are the contractors; and the materials will be sandstone for rubble and limestone dressings.—The works in the erection of the church of St. Agatha, Glenesk (the foundation-stone of which was laid a few months ago), are being rapidly carried on. There is a nave and chancel, with aisle (with sacristy at eastern end, and a tower and baptistry at the west end), and a south porch. The upper part of the tower terminates in an octagon. The east and west windows of chancel and nave are three-lights; the south windows of nave and north windows of aisle, two lights. Dimensions in clear, 95 feet 6 inches by 40 feet. The style is Decorated Gothic.—The foundation-stone of St. Michael's, Lixna, near Tralee, was laid in September last, and the building is gradually assuming proportion. It is in the Romanesque style, and comprises nave and chancel, with semicircular apse, and aisles with sacristy. The dimensions interiorly are 88 feet 6 inches by 50 feet. The materials used are the limestone and marbles of the district; the contractors are the Messrs. Beardwood, of Dublin.—The interior fittings and decorations of the M'Eniry Chantry, Tralee, are being carried out by Messrs. Hardman and Co., of Dublin. They consist of an altar and reredos in Caen stone, alabaster and coloured marbles richly carved, a high tomb with recumbent effigy of Dean M'Eniry vested in canonicals, screens separating the chantry from the other parts of the church, rich encaustic tile pavement of floor, a group in bas-relief, illustrating one of the most characteristic scenes of the dean's daily labours, and various coloured decorations.—The church of St. Mary, Newtownforbes, county Longford, is being erected on a site granted by the Earl of Granard, K.S.P. The first stone was laid on the 1st of May last; it is now nearly ready for roofing. It consists of nave and chancel, side aisles, and side chapel, and sacristy. The east windows are triplets of lancets; the windows of north and south aisles are couplets of lancets. There is no clerestory. A bell-cot surmounts the west gable. The clear dimensions are 97 feet 6 inches by 53 feet. Mr. Gardiner is the contractor. The materials used are rubble and limestone dressings.—The Church of St. Mary's, Kilronan, Keadue, county Roscommon, is being erected near the ancient church of Kilronan. The plan comprises the usual arrangement of nave and chancel, aisles, side chapels, south porch, double bell-cots on west gable of nave. The style is Early Decorated Gothic. The west window of nave is of three lights, under a receding arch supporting the bell-cot. The east window of chancel is of three lights; the north and south windows of aisles are of two lights. The dimensions in clear are 100 feet by 53 feet 6 inches; the materials used in the walls are red sandstone, with white limestone dressings. The contractor is Mr. Barker. Mr. J. J. McCarthy, R.I.L., is the architect to all the foregoing works.—Designs have been prepared by Mr. Bourke, architect, for enlarging and improving the Franciscan Church, Waterford, by adding additional columns to the interior, and removing the present roof. A continuous entablature will be constructed over the present columns, from which will spring a lofty cylindrical panelled ceiling, covering the nave; the aisles will have lofty segmental ceilings, with circular groins over the windows; an attic will be built over front pediment to conceal the additional height of roof.

SCHOOLS.

Ireland.—At the Presentation Convent, George's-hill, Dublin, extensive poor schools have been commenced. The building will contain, besides the basement, four schools, 40 feet by 25 feet each, and 17 feet high, together with entrance hall, stone stairs, class-rooms, cloak-rooms, &c. The exterior will be plain, faced with red brick; cost, about £2,000. Similar schools are about being built in connection with Convent of Mercy, Athy.—It is in contemplation to commence immediately, in Longford, large national schools, together with a convent for Sisters of Mercy, and extensive convent schools adjoining the intended new diocesan seminary of St. Mel; preparations are being made to proceed with the erection of the latter building. The great campanile of the cathedral of St. Mel is approaching completion; same architect.

THE STREET ARCHITECTURE OF LONDON.*

THE street architecture of London is a subject which I feel may be treated in many different ways, and which admits of a much larger amplification than I at all contemplated when I ventured to put my name down in the list of lecturers, with a promise to say something upon it.

Thus, the associations attaching to the different streets and houses; the way in which this great city has gradually grown since that not very remote period when old London wall was its boundary, and the outworks of the Barbican stretched into the adjacent fields, till it has reached its present gigantic dimensions; the origin of the names of divisions of the city and of streets, and many other peculiarities—might all afford the subject of interesting disquisitions, but which would most of them be more antiquarian in their character than would be suitable to the special views which this society desires to advocate. I will step aside, however, to point out one practical result of the "metropolitan improvement" going on in the present day, which is perhaps overlooked, but the serious consequences of which will certainly be discovered by future inquirers; and that is, that the new system now carried right and left, according to which the names of streets are simplified, while subsidiary names are done away with altogether, and the entire numbering altered, so as to expunge all minor distinctions where possible, ranging a long line under one appellation, will certainly tend to obliterate numberless spots of interest for which the future antiquary or lover of art reminiscences will search in vain. But it is not, after all, so much that old spots are marked under new designations, and old streets dubbed with new names, as that a very great demolition and rebuilding of entire streets to make way for new or of old houses in old streets, is taking place; so that if London is not being transformed as quickly as Paris has been, it is at all events undergoing the process as completely, though more slowly, and at the present rate some fifteen years hence will witness almost as great an alteration; and this, be it remarked, is not done by any means upon that well-ordered system and under that controlling power which exists in the foreign capital. How far such a system as that would be beneficial to us is a question which I shall just touch upon in the course of what I have to say.

The antiquary may experience a pang at the disappearance of the old landmarks of history, and of spots hallowed by the footsteps of those great in literature or art; but for the most part the lover of the fine arts can afford to view these inroads at least without regret: occasionally, indeed, he may find cause to grieve, but this is rather when some object of beauty becomes lost or obliterated. For example, I observed very recently that the old hall in Bishopsgate, built for Sir John Crosby in 1471, interesting to the antiquarian as having been the council chamber where Richard of Gloucester held his secret council, and whence he ordered Hastings to the block, and worthy of notice from the lover of art on account of its architecture, has at last descended to fulfil the very ordinary purposes of a wine merchant's cellar—a fate which the handsome old hall hardly deserved, and which we must all regret. That the old houses of the early part of the last century, with their originally careful, but now more or less dilapidated, brickwork, their window-frames flush with the face of the wall and fitted with heavy sashes, wooden cornices and doorways (well designed though those latter often were), should make way for modern structures, no one need regret; the roofs of these buildings were often picturesque in their outlines, but on the whole they had very little art about them externally, and they did but prepare the way for the Harley and Baker streets of more recent era, whose day I trust is gone for ever.

London, perhaps, has fewer remains of its former self than might have been expected from its age and long and ever-growing prosperity—though, in truth, it is this very prosperity which has had much to do with the demolition of old buildings. Old London, unlike some of the better preserved Continental cities, was built mostly of wood, plastered over; liable, therefore, to decay, and quite unfit for many purposes to which buildings of stronger construction might have been applied when altered circumstances came, and which thus might have been preserved. Buildings of stone walls and oak floors would have made very good warehouses: not so the old half-timbered houses, with their gabled fronts overhanging story beyond story.

London in many parts may certainly be called picturesque, full of sites offering fine opportunities for effect. One part has grown out of another, as occasion made necessary. No generally dominant idea can be said to prevail; it has spread, and that to a most inconvenient extent—unfortunately, not upwards, by which it might have become a far finer city; but a great growth of area has taken place, adding nothing at all to the general effect. The sites I allude to are not such as Oxford-street or the Strand—broad, straight streets, which might be flanked on either side by lofty buildings, with a predominance of long, level cornices and lines in their composition, like the new Parisian boulevards—but Holborn-hill, Ludgate-hill, Fleet-street, Cheapside, Whitehall, Piccadilly, &c.—localities which, all of them, invite that particular treatment which we find exemplified in the new buildings in Bishopsgate-street, opposite Crosby Hall, a coach-builder's premises near the Park, in Piccadilly, and those very striking schools in Bloomsbury, with others I might name. In the situations above named, how can the eye be satisfied unless there is a broken and well-defined sky-line, a certain amount of irregularity, order within disorder, in that which we call picturesque, an acceptance of every little difficulty in order to clothe it with beauty and meaning.

There is something so oppressive to the imagination if one pictures sites like these as being rebuilt in the studied, carefully cut-up, divided, and subdivided styles of Italian architecture, as practised in this day, that one would almost rather they remained as now, with little or nothing to boast of architecturally, as a whole; and let it be specially borne in mind that you, who are not building houses yourselves in these localities, may yet be able to influence others who do so. Every building will become an item in the final result, and I know how often everything is overlooked except mere utility—nay, more, that the architect is often blamed if he is supposed to give much attention to external appearance.

Writers in the public papers commonly speak of the architect as being the ruling power in all cases. Indeed, he is no such thing, and in the majority of instances he is obliged to give up many points which he would far rather have maintained; and in many more cases he knows beforehand that to attempt what his client would call wild vagaries, or pretensions display, or needless outlay, would lose him his business, and soon compel him to retire, without even what the advertisements call "a moderate competency." Where there is an intentional

and studied effect visibly apparent, and the result of which is bad, of course the architect should be blamed; but this is not the reason of failure in the great majority of instances which excite adverse criticism. If I see a design, in one part of which the architect has set his thought, which he has filled with the impress of his own mind, where he has ventured to indulge in some piece of good and effective design, and has dared to introduce some judicious and well-studied ornament—almost by stealth, as it were—I know I must absolve him from blame if the rest of the design be bald and uninteresting, flat and commonplace, or even in some aspect of proportion or arrangement offensive.

In street architecture the surface decoration has, for the most part, a secondary office to fulfil, the buildings are seen in a sharp perspective, and the projections, reveals, and solids contribute most to the effect, particularly bay windows or corbelled turrets, and an effective treatment of the roof, which latter, I think, should not have too much projection, but should cut well against the sky, and should obscure as little as possible of the upward view; in street architecture especially do the roofs play a most important part, both by the picturesque outline they may present, and by the more varied effects of light and shade which they contribute where the light may fall. I cannot well imagine any street ugly where there is a general harmony of main lines, and a well studied and picturesque treatment of the sky-line; while I cannot imagine a plain row of houses looking very well, where there may be an elaborate care bestowed in the treatment of the flat surface, but which ends only with a plain level parapet, presenting one never varying effect against the sky, and throwing one dead shadow on the opposite side.

In truth, the elements of good effect, if not of beauty, in street architecture are much simpler than most people imagine; if the main outlines and general proportions are good, if the architect's practised hand and trained eye has thrown the parts together with a regard to fitness and simplicity, the absence of ornament and costly decoration will hardly be felt at all—not that the capability to impart this satisfying and happy result is the easy and early attainment of the architect; on the contrary, it is, perhaps, one of the last things he learns, for it is an easier matter to design an ornamental feature, good in itself, than to know well beforehand, on the paper, how to give the best effect to the masses of buildings in execution, where so many extraneous causes may conspire to make or mar the success of the composition. Grouping of the masses and telling outline against the sky are certainly the main things to be observed. The building erected opposite Crosby Hall, and before alluded to, is very ornamental in its details, but if nearly all that ornament were dispensed with it would still look almost as well; this may also be said of the new "Life" offices, in Bridge-street, Blackfriars, and of some of the new hotels which have recently been erected; but for admirable outline, balance of parts, and grand general effect, what can exceed St. Paul's, as seen from Ludgate-hill? Is it the sculptured pediments or other architectural enrichments which attract the eye, and fix the building on the mind of the beholder? or is it the towering magnificence of the lofty dome, and the play of light and shade, the solidity and repose, the breadth at once and the lightness of effect of the whole composition? I know of nothing to surpass the view obtained of the Cathedral from the point above named. As the roof in Gothic architecture, so the dome and cupola is the great element of picturesque treatment in Classic architecture; and it is partly, perhaps, because roofs are more common and more useful than domes, and that lowness of pitch will harmonise with Classic architecture and not with Gothic, that the latter has gained so much in public favour. That the want of a fitting accessory of this kind is felt and acknowledged is sufficiently proved by the fashion lately set in, of making high and steep sloped roofs with or without a flat top, and in this way Classic architecture redeems itself almost entirely from reproach in this respect. I may instance the Tuileries as a striking proof of this; and among ourselves we have many instances—the most recent, perhaps, is the Duke of Buccleuch's house, at Whitehall-gardens, though whether the feature here is treated altogether judiciously may be a question for the critics.

The bright clear sky of Greece, Egypt, and Southern Italy, may, perhaps, form the very best background for the beautiful temples, with their long straight cornices and flat pediments cutting clearly against it, and they may be the most appropriate forms to be relieved by it; but in our northern climate the sky is hardly ever clear of clouds, which present forms of every possible variety in every direction and inclination, and mostly of curved outlines; it is not harmonious to rule against this background long level lines without break or intermission, but, on the contrary, the steep, straight, or swelling gable, plain or stepped, the curved dome or roof, and every other feature giving play of line against the sky, is harmonious, and in unison with that background in connection with which they can alone be seen.

Will any one deny that in a long continued façade of buildings—say the Rue de Rivoli—it is most refreshing and agreeable to come to a break where there is a design of another character, successful in the particulars to which I have alluded? It is, however, not because the design may be what is called "Gothic" that it will prove deserving of favour above Classic; there are some new Gothic houses on both sides of Cheapside, but they both of them fail to give so pleasing an effect as a smaller and less pretentious building now just finished in Old Broad-street; because, in the former cases, the old level line of parapet is adhered to, while in the latter a gabled roof finishes the design. A merely curved or sloped roof, so long as it can be seen from below, will go far to supply what is wanted. The French are fully aware of this, and always let their roofs be seen; and, among others, I may mention the Universal Marine Offices, in Cornhill, as an instance of the truth of this remark, giving the whole building a more pleasing form, and one which the eye readily singles out, in spite of the ornamental and towering structure occupied by Messrs. Sarl, in the neighbourhood.

What I have said is, however, perhaps rather as hoping to influence the future, through those who may agree with me, than as speaking of the present. Our street architecture is, upon the whole, lamentably deficient in this attribute; and when one really feels how wonderful the change would be if any of our fine main thoroughfares could be remodelled with careful study as to the roofs, it is impossible to help dwelling on the point, and very earnestly entreating all who can do so to consider and to advocate the subject as opportunity arises, the difficulties interposed by the Metropolitan Building Act notwithstanding.

There is, however, another point in connection with our street architecture not easily to be dealt with, but which it would be most desirable to control if it could be done, which is, that it constantly happens that new buildings very much spoil one another, and very needlessly; every man considering just exactly what he has before him, and utterly ignoring what will exist on each side of his design

* Paper read before the Society for the Encouragement of the Fine Arts, 10th April, by Mr. JAMES EDMESTON.

when executed. The result is most painful; moulding and cornice are abruptly cut off, every feature is utterly at discord in each case with the others: no pains even is taken to render the design complete in itself, and the front looks as if it had been intended to be one of a row, which, by some change of intention, was never continued. To enumerate instances would be needless, every main thoroughfare exhibits them, and strangers must be struck with this state of things as a peculiarity of municipal management of a most extraordinary character.

I fear no ordinary means are sufficient to cure this state of things. In the present state of architectural feeling, while the battle of the styles is either breaking out in open fury, or smouldering out of sight and ready to break out, there is an habitual disregard of other than personal feeling, and rather a delight in showing contempt for all work of a different character brought into juxtaposition. It becomes, for example, an article of faith to show as much as possible how the creed professed by the disciple of Gothic architecture differs from that of the Classic architect, who has been at work on the next plot of ground, and *vice versa*, though, perhaps, the injury sustained is at least equal to that inflicted. All this is wrong, and is, perhaps, at the present moment the greatest bane of our street architecture, every integral part destroying its neighbours as far as it can, whereas the study should be to make the whole as perfect, as a whole, as possible. Now, far be it from me to recommend that public censors should be established in matters of art, or that there should be any additional legislation in such matters; still I do think that some general rules might be laid down applicable to our main thoroughfares, and which would injure no one, interfere with no private rights, and which would succeed in reforming to some extent the present state of chaos. For example, just as a certain line of front is established, let certain main lines of elevation be fixed, which shall not be departed from; let the height of the ground-floor stories be fixed, the line of the top of the one-pair windows, the line, say, of the coping or finishing gutter, leaving all above that free. Now, this would only so far control designs as to enable the architect to show his talent, which would enable him to keep these main lines as boundaries, while he would fill up between them as suited the requirements of the work in hand. He might in the interval have fewer or more stories than his neighbour, he might divide them differently, and an absence of all sameness would be secured; but there would be just so much control over the *ensemble* as would tend to promote a general harmony of effect. And if, instead of every man cutting off his projections ruthlessly just where the centre of his party-wall may come, he was compelled, in a give-and-take way, to return and finish them properly, while the lines of one composition were made either to lead out of those already established or else to be made properly distinct, I can believe that a great gain in our architecture would be accomplished, while there would be as much freedom as there is now. A government or a municipal body has something to answer for in this respect. What shall be said if the re-arrangement of the new Government offices at Whitehall is not complete as a whole, every part helping every other part? How admirably is this carried out in the capital to which we have before referred. I think it is a disgrace to our "local management" that the beauty of our city is not cared for in its several districts as well as the cleanliness, and I believe it might practically be done.

Many new streets and approaches are now being laid out, some of the most important relating to the Thames embankment, and now is the time for making some effort in this direction. The present Chief Commissioner, Mr. Cowper, I am able to say, is most ready to listen to suggestions; and when a deputation waited upon him some weeks back to point out the desirability of laying out the new streets so as to lead off to many points, and to gain the best advantage for existing buildings, as well as to open the view to new buildings in the best way, he requested the Institute of Architects to appoint a small committee to bring into form and to discuss these very questions, with a view to insuring the best attention to them. And this state of things—the representative of the Government, working with the representatives of the lovers of art in carrying out great public improvements—is an encouraging guarantee that wisely-directed efforts will not be made in vain.

London is not a "show city"—not a place of European resort for pleasure and gaiety—but the great banking-house of the wide world, the busy mart of the universe, too much taken up hitherto with contemplation of its own growing prosperity, with very little care of external appearances, like a rich merchant, who, well knowing the filled coffers at his banking-house, cares very little for the threadbare appearance of his outward garb; yet there are spots which the busy citizen daily treads without observation, but which may well arrest the stranger, and must not be passed without remark.

What can be more striking than the views of the great city from some of the bridges as you approach from the southward, especially London and Blackfriars bridges? Walk up Ludgate-hill, stand at almost any point about the Exchange, or in Holborn, where you can take in the view of the rising hill and some part of the broad roadway beyond; stand where the several great thoroughfares meet at the northern end of London-bridge, or look upward from the lower ground as you approach its southern end; and while from many of these positions you will see examples of architecture of which any country might be proud mixed with buildings of the commonest character, and in the worst taste; you will, if you can look with the unaccustomed eye of the stranger, forgetting for the moment how constantly you tread these spots intent upon anything rather than giving them the least attention, you will see much to admire, much to be struck with as a whole; you will be conscious of a general impression as powerful as any you ever experienced when looking for the first time on great cities in other lands, and the imagination of the artist will find ideas the most suggestive and varied.

I might single out many buildings recently erected, and which go very far to redeem our streets from the architectural barrenness of which I have complained, but I feel it would be somewhat presumptuous for me to do so, and that the task is better left in the hands of a non-professional critic. You have heard their treatment which I advocate, and doubtless several examples of it will have occurred to you during my observations. If you should not agree with me, you will at least judge and compare as you have opportunity, and you will arrive at a determination, one way or other, in your own minds. If architecture does not progress as it should, it is because there is a public apathy and want of interest, arising from a lack of knowledge upon the subject not creditable to us as a nation, and which, of course, begets a lack of taste, or, perhaps, a bad taste founded on no principles and guided by no rules; so that we occasionally hear in high places most extraordinary reasoning upon this subject when some great occasion brings

it to notice—or we find an individual absolutely appointed to foster, encourage, and promulgate art, able to convince himself that architecture is a mere mechanical effort, not exactly of heaven-born genius, because any one may perform it, nor yet of mental training, because, says an authority, there have been great architects who, it seems, have had little of this; so that careful loving study of the subject, with toilsome experience in it, go for nothing. All very unworthy, mistaken, and contemptible fallacies, which, if they could have any weight at all, would tend to undo every good that has been of late years effected, and would end by extinguishing one of the three fine arts entirely. Such mistaken statements stand rebuked by the great monuments of past ages as well as by a thousand efforts in more modern times, and, I may add, stand exposed in their absurdity by every effort to act upon, or to give any practical effect to, them.

I ask the members of the Society to guard with a jealous care any attempt to lower the standard of art, or to introduce meretricious views with respect to it. It may be false taste in sculpture, or wrong principles in painting, or a numbing influence, a cold shade, a cruel detraction thrown over the noble art of architecture, which, if it were possible, would destroy all that has been done this twenty years and upwards to excite higher aspirations and truer feelings, but which shall not prevail, but shall be once for all condemned by an enlightened public opinion, true to itself and to what is due to the national honour in these respects.

THE DECORATION OF THE INTERNATIONAL EXHIBITION BUILDING.*

THE building for the International Exhibition, now so shortly to be opened, has been lucidly explained by Captain Philipotts, in the paper read before you in December last; therefore, it will be unnecessary for me to take up much of your time in a description of the various parts of it, and I will only briefly recall to your minds the main features and arrangement of the building, in order that you may more easily understand me when I refer to them in my description of the decoration. This arrangement of the building will be easily understood by referring to the ground-plan. The principal front faces the Cromwell-road, and has a south aspect; it extends nearly 1,200 feet. On the first floor of this front range the series of picture galleries. Parallel with this front is the nave, 800 feet long, and terminating at each end in the great domes, each 160 feet in diameter. From these extend again, north and south, the transepts, having each a length of 200 feet on either side of the domes. The height to the pitch of roof in nave and transept is 100 feet, and the width between the columns 85 feet. The great domes have a diameter of 160 feet, and rise to an interior height of 200 feet. Galleries 50 feet wide extend on both sides of the nave and inner sides of transepts. Other galleries, 25 feet wide, are carried round the outer sides of transepts and sides of walls of picture galleries, and one 12 feet wide against walls of refreshment rooms.

Parallel with the nave, and on either side of it, are the glass courts; those on the south side being 200 feet wide, those on the north 87 feet.

On the north side of this area is a large range of buildings, forming the refreshment rooms; through these, under a triple archway, nearly opposite the main entrance from the Cromwell-road, is an entrance to the Horticultural Gardens, of which a most pleasing view is here seen. This completes the description of the main area of the building; but at both extremities extend two very important additions, namely, the eastern and western annexes, the latter nearly 1,000 feet long, and the former 775 feet.

Having refreshed your memory as to the form, size, and arrangement of the building, I will now speak of the decoration of it.

We will enter by the great archway in the centre of the south front, and passing by the staircase which leads to the picture galleries, and to which we will return by-and-by, we proceed to the nave. I confess that when I first saw this interior my heart quailed; its general aspect was not encouraging; the day was damp and bleakly cold; the rough polygonal arched principals and diagonal boarded ceiling looked heavy and difficult to manage; the light from the clerestory windows fell in faint streams on the muddy road, that was then the traffic way in the interior; masses of dark scaffolding, obstructing the light from where the domes were then being erected, and the various trials of colouring which had been already made, one, at least, of them by an able man, showed me that it would require very careful consideration indeed before I should decide upon what style of decoration to adopt. Do not let me be unjust, nor let my own apprehensions as to a successful treatment of the decorations lead you to suppose that I mean to reflect on the building itself. When I came quietly to consider all the features of the construction, I found that those apparently heavy principals only required to be properly treated in colour to be sufficiently light; that they were also of most ingenious construction, that the proportion was pleasing, and that the light of the clerestory windows was amply sufficient. I fear that many may have seen the building under the same adverse circumstances that first presented it to my view, and have passed criticisms not so just as the merits of the undoubted talented contriver of the building should deserve. Pardon me if I have wandered for a moment from the subject of my paper, more especially as I earnestly hope, that in any discussion that may follow it will be borne in mind that it is only the decoration of the building which is now before us.

Well, we are in the nave. How to decorate it? I had not too much time to think; the work must be done. It was January; the 23rd when I received the authority from the Royal Commissioners to assume the decoration of the building with the entire responsibility of the results—the work must be completed by March.

After careful consideration I decided that the general tone of the roof must be light, and that the best colour would be a warm pale grey; that the arched principals must be made to stand out clear from the roof; that they must look well in a perspective of 800 feet; and that they must not look heavy or confused as they approached each other in the distance. No single colour would do, and after a pretty stiff bit of reflection of twenty-four hours, I confirmed myself in my opinion of what would be the most likely way of treating the principals.

I have remarked that the form of these is polygonal, and is best explained by the scale-drawing marked (A). They are in three thicknesses, the centres of the outer planks covering the joints of the inner ones.

I consider that the form precluded the use of a continuous repeat ornament; I therefore decided on following the form of construction, and adopted panelings of blue and red alternately, relieved by coloured lines, intersected at the joints by circles of black, on which are gold stars, and from these spring ornaments in vellum colour with green in the filling, as shown in the coloured drawing.

Following out this arrangement, I had a pattern painted on paper of the full size of one of the principals, and it was fixed in its place within a week from the time of my appointment; part of that identical pattern is now in this room; it has never been altered, and thus exactly it has been carried out throughout the roofs of the nave and transepts.

Until the principals were coloured, it seemed to me that the thicknesses were lost; I wished to make the construction evident, and I therefore coloured the two outer edges in chequers of black and vellum colour, and the centre edge full red. As to the bracings above the polygonal arches I coloured them the wormwood colour, with red or blue coloured lines on the face, and the under thicknesses red.

I have said that I decided on warm grey for the roof of nave. I did so because it gave space and lightness; and on its surface I introduced an upright scroll ornament in red, with gold star-like rosettes sparingly introduced. My object in this ornament was to raise the apparent pitch of the roof, and to relieve and warm the effect of the grey. The horizontal purlines, on the contrary, I kept purposely light, so as not to depress the rise of the roof, or interfere with, or confuse the effect of the principals. The ridge piece of the roof, in itself comparatively small, I marked as strongly as possible, as the apex in black and vellum

* Paper read by Mr. J. GREGORY CRACE, before the Society of Arts, April 9th.

white, *en chevron*; on each side I coloured a margin of maroon red, and a little below that a bordering of very warm green, shaped to accord with the top scrolls of the red vertical ornament, the green being relieved with rosettes of gold colour. At the base of the slope of roof this green is again introduced in much the same way, and the band of maroon also. Below this are the clerestory windows.

The next important features in the nave are the iron columns, supporting the principals as well as the galleries. These I have painted pale bronze colour, relieved with gold colour vertical lines. The capitals are gilt; the grounds being picked in rich red or blue alternately; the centre blocks of the columns are also coloured red, with bands of blue, or, *vice versa*, the mouldings being gilt, and the same style of colour is continued to the bases. The top plate above the columns is painted bronze colour, relieved with light gold colour ornament on the upper part, and a vitruvian scroll in gold colour, with a maroon red base on the lower part.

The gallery railings are light bronze colour, the rose, shamrock, and thistle ornament being partly gilt, and the whole backed with deep red cloth. The plate under the gallery is painted oak colour, relieved with deep brown interlaced ornament.

I have kept the part below the line of arches purposely quiet in colour, in order that the brilliancy and richness of the various articles exhibited may not be interfered with. The roof, on the contrary, is rather vivid in colour, to carry up, as it were, in some degree, the gaiety of the scene below; and this will be still further sustained by a series of banners of the various countries whose products are assembled in this International Exhibition.

Much variety of opinion has been expressed at my introduction of the vivid colours in the arched principals of the nave; but I think that many who fancied it would look too powerful, will confess their surprise at its comparatively quiet effect now that it is completed. The colours being properly balanced have neutralised each other. Most of you probably know that blue, red, and yellow, in the proportion of three, two, and one, when mixed with white, produce a grey, exactly the same as a grey produced by mixing black and white. I will show you. I take ultramarine blue three parts, vermilion two parts, and chrome yellow one part. I mix them together, add some white—you observe it is grey. I take some black and white, mix them, and identically the same grey is produced. If you paint on a disc radiated stripes of blue, red, and yellow, in proper proportions, and make the disc revolve rapidly, you find grey produced, the same as if they were stripes of black and white. The effect of the roof of the nave exemplifies the theory.

I have heard it said by some that it would have been better to have employed panellings of one colour instead of two to each principal, and made the principals alternately blue and red; in my opinion they would have been utterly disappointed; the striped contrasts would have by no means given the softness, richness, and glow of the present colouring. To convince myself I, at one stage of the colouring, tried, by fixing blue paper over the red panellings in one principal, and red paper over the blue panellings of another; the effect was not nearly as good, and I was confirmed that the principle I had adopted was the right one.

You will find this principle of counterchanging colours adopted in most of the decorations of the early masters, which abound in Italy;—those decorations, so beautiful, so interesting, rich, glowing in colour, full of fancy and taste in the ornament, the masses well arranged, the most perfect harmony everywhere, and dignified by often acting as the framework of the highest gems of art. My son, who has been lately studying from these works in Italy, has made a series of sketches from some of them, which I thought might illustrate the observations I am addressing to you, and prove not uninteresting to those who are fond of decorative art.

You will find in the roof of the Upper Church of Assisi, in the Chapel of St. Corrado, of Orvieto, and in the Palazzo Spina, examples of counterchanging of colouring, and in the roof of the Cathedral of Lucca the chevron of black and gold. In fact, the works of the Italian decorators of the fifteenth century afford most valuable lessons in ornamentation and colouring. But I must not be led astray from my more immediate subject. Having described the nave, I will now proceed to the domes which rise at either end of it, and form a point of intersection with that and the transepts. They are undoubtedly the main features of the building.

In plan their form is dodecagonal, or twelve-sided, but are made to assume the appearance of an octagon, because the arches towards the nave and transept cross each other, and form a kind of angular-arched opening of 85 feet span, the intermediate arches being about 35 feet span. From the floor of the nave to the springing of the domes is 114 feet, the total interior height to the crown of the domes being about 200 feet. There are twelve main ribs to each dome, meeting in a sort of ring plate, and thence eight of them carry on to the centre. The crown of each dome has an ornamental zinc covering, as explained in the drawing; all below this is glass.

My principal difficulty in carrying out the decoration of the domes was, that I could see nothing of them. The scaffold formed a series of solid stages or floors, through which it was impossible to view anything, and I confess I never could mount the ladders above 100 feet; but even there the scaffolding was so thick that I could see nothing of the top, and very little of the cornice, fascia, and walls.

At last Mr. Ashton contrived to get for me an open square box into which I got, and was drawn up by means of his beautiful little engine very pleasantly to the top; yet when I got there the ceiling almost touched my head, so that I had no opportunity of judging beforehand of the effect of distance and light upon my colouring, and I knew well that they were very formidable elements for consideration. The knowledge that the scaffold would be taken down before I possibly could judge of the effect, and that when once down I could never hope to touch my decoration again, caused me many an anxious thought.

My drawings will best explain to you the colouring I adopted for the top of the domes. The main ribs are painted bright red, with spaced black and white at the edges, and a fine gold line up the centre appears at intervals of about four feet into lozenges and circles containing gilt stars on a blue ground; where the main ribs reach the ring plate I carry round the red, marking the points of intersection with black and white; thence the eight main ribs are painted deep blue, relieved with red, gold, and black, until they meet in the centre pipe or pendant, which is gilt bordered with red. The shaped covering, or umbrella, as I am accustomed to call it, is painted light blue; gold colour and gilt rays diverging from the centre and streaming a considerable way down the blue, the shaped outline of which is bordered with red and gold ornament.

In decorating the walls of the domes, the solid parts between the arches and the springing of the roof, it was necessary to consider the probable effect of the great mass of light above. On the one hand it was desirable to sustain it with sufficient strength of colour, on the other it would be dangerous to make it too heavy.

The moulding of the cornice and fascia are painted vellum colour, very slightly relieved by gilding; the trusses are gold colour, the fascia between them is red, with a vellum patera; the soffit is green. The broad fascia below is painted blue, and on it is inscribed in gold letters, three feet high, the exordium of David, in the 29th chapter of the first Book of Chronicles, "Thine, O Lord, is the greatness, and the glory, and the victory, and the majesty: for all that is in the heaven and the earth is thine;" and "O Lord, both riches and honour come of thee, and thou reignest over all; and in thine hand is power and might, and in thine hand it is to make great."

The large iron columns, which rise nearly 100 feet high, are painted dark maroon colour, their capitals being richly gilt. The panelling between the arches and the frieze is painted in shades of red, relieved by coloured lines; in the four broad compartments are inscribed, on dark green panels, Europe, Asia, Africa, and America; below, on a circle, are the initials of those so beloved by us all, Victoria and Albert. On the eight spandrels to the four main arches are medallions, eight feet in diameter, by Mr. Burchett, of the Kensington School of Art, emblematic of manufactures, commerce, and the various arts and sciences which lend their aid. These were executed in an exceedingly short time, and, like all the rest of the work, with no opportunity of judging how they would look in their elevated situation. I should add that round the red panelling is a broad margin of sage green, on which are stencilled paterae. The moulding of the arches is painted vellum colour, the top fillet being gilt, and the face of them ornamented with vitruvian scroll in dark colour.

The walls at the gable end of the nave and transept are treated so as to recall the arched form of the principals. Under these a semicircular panel is formed of warm brown colour, bordered by a broad blue margin, on which are gold stars. Inside the panels are written the following sentences:—

On the east end of nave—

"The wise and their works are in the hand of God,"—Ecclesiastes, chap. ix., v. 1.

On the east end of transept—

"Alternately the nations learn and teach,"—Cowper.

On the south-east end of transept—

"Each climate needs what other climes produce,"—Cowper.

On the west end of the building the sentences are in Latin, being the part occupied by foreign exhibitors. At the end of nave is written—

"Gloria in excelsis Deo et in terra pax."

At the north-west end of transept—

"Domini est terra et plenitudo ejus."

At the south-west end of transept—

"Deus in terram respexit et implevit illam bonis suis."

Inside these semicircular panels are a series of radiating panels, painted maroon, and bearing the names of the various sciences and arts which have affinity with the objects exhibited. The coloured drawing will more directly explain what I have thus endeavored to describe.

I have mentioned that on either side of the nave extend the series of courts roofed with glass. These admit of very limited decoration, and the colouring I consider should be of a subdued and retiring character. The objects exhibited are to be the show. The brick walls which form the boundary on one side not being dry, it was necessary to have a colour which would not be materially affected by that circumstance. I adopted a quiet maroon colour made with venetian red and purple brown. The columns are painted pale bronze, relieved by gold colour.

The skylight frames are painted cream white, relieved by lines of red and blue alternately. Under the galleries the ceilings are painted very light grey, the joists cream white, the bottom edges lined blue, and the girders lined maroon red.

Let me here offer a few words of advice to the exhibitors of manufactured goods in silks, woollens, and cottons.

Many rich and valuable stuffs were, seriously injured at the Exhibition of 1851, by injudicious arrangement of them. Broadened silks of gay colours, or printed woollens or cottons, are best exhibited if somewhat shaded from the light; it would be well, too, if they were contrasted with deep tones of velvet or other plain material.

In the arrangement of plain fabrics, such as cloths, merinos, or velvets, much will depend on the way the colours are brought together. Avoid blazing contrasts of colour, such as bright red next bright green; or bright blue next bright yellow; such contrasts are not harmonious—let one of the two colours always be subservient to the other. It is not so much what colour a material is, but how that colour is made to appear. It is necessary to bear in mind that all colours have their complementaries, which add to or detract from the beauty of the adjoining colours, according to what they may be. Thus, the complementaries of red are green; blue are orange; yellow are violet. If you cut out pieces of grey paper in an ornamental form, and stick a piece on each of the three colours I have named, you will find, in a shaded light, the grey will be fully tinted by the complementaries of these colours. But you cannot lay down precise rules. An experienced artist can bring any two colours together by properly modulating them.

Nothing is so charming and so refreshing to the eye as an harmonious arrangement of colours; they are "like a sweet chord of music to the sense." The band of nature never errs, whether it brings together scarlet and crimson, as in the cactus; scarlet and purple, as in the fuschia; yellow and orange, as in the calceolaria; or the colours in the varied plumage of exotic birds—the harmony is always beautiful, ever perfect. The laws of harmonious colouring are a necessary part of the knowledge of the manufacturers of coloured fabrics.

I will suggest a few contrasts. 1. Black and warm brown. 2. Violet and pale green. 3. Violet and light rose colour. 4. Deep blue and golden brown. 5. Chocolate and bright blue. 6. Deep red and grey. 7. Maroon and warm green. 8. Deep blue and pink. 9. Chocolate and pea green. 10. Maroon and deep blue. 11. Claret and buff. 12. Black and warm green.

Resuming our immediate subject, we will now return to the principal staircase, which we passed on our entrance from the Crociwell-road. The walls of the lower part of this staircase will be painted maroon red, as a background for the statues, bas-reliefs, and other art works which will be placed here. The upper part of the wall, or rather space above the wall, will be enclosed by the various specimens of stained-glass. Arrived at the landing, we enter the centre vestibule, from which we first gain the view of the magnificent range of picture galleries, extending 500 feet on each side. This vestibule will itself be filled with sculpture. The walls are coloured subdued red up to the string-course, above that they are sage green.

The picture galleries on the east side contain the collection of the British, those on the west side the foreign schools; in size and arrangement they are exactly the same. The width of the galleries is 50 feet; the wall is 31 feet high, up to the cornice, from which springs a deep cove supporting the centre light.

Many of the pictures to be exhibited having been painted many years, it was essential to have a very low tone of colour for the walls; I adopted a sage green. When the colouring was partly done, and there remained some of the white wall still uncoloured, it was thought by many that the tone would be far too dark, and I mention this to show how difficult it is to judge of effects of colour till all the parts are complete. I never at present hear any fears expressed of the too great depth of colour. The cornice is painted vellum colour with maroon in the hollow, the ground of the cove is tinted of the same hue as the walls, but much lighter. I have divided it into two compartments by upright margins in vellum colour, on which is stencilled ornament on a deep ground; the compartments of green are marginal lines of maroon. The soffit is also vellum colour relieved by stencilled ornament in maroon, and the upper cornice is cream colour.

The end walls of the principal galleries are slightly decorated; on either side of the arched entrance it is intended to place statues, and therefore it was necessary to have a maroon-red panel background; this is carried up to the springing of the arch, and thence broken into five concentric panels; above these are painted ornaments supporting medallions, in which are inscribed the names of painters.

To show with what energy it was necessary to carry out the works, I will mention that the whole of the picture galleries on the east side were painted and decorated in five days. I was asked on Saturday if my designs were ready—I decided the colours on Monday morning, the work was commenced at mid-day, and completed mid-day the following Saturday.

At the end of the principal galleries we enter the auxiliary galleries, which have a length of nearly 250 feet on each side of the domes; in these will be arranged the collection of water-colour drawings, architectural designs, &c.; here I have adopted a lighter tone of the same colouring, as in the larger galleries.

Crossing over to the north side of the building we enter by the triple archway, which I have before mentioned, the immense range of apartments devoted to refreshments; unfortunately, the state of the walls is such, that it will not be possible for the present to decorate them, except, indeed, the three large rooms on the upper floor, where the ceilings are of wooden construction; but I must needs confess that nothing I could do on the walls would compete with the charming view to be seen from the windows which run the entire length of these rooms. The whole of the New Horticultural Gardens is seen with beautiful effect; all their ornamental parterres, fountains, and walks, bounded by the handsome colonnades and conservatory, being seen in greater perfection than from any part of the Gardens themselves.

Having thus described to you, very imperfectly, I confess, the decoration we have done, let me explain to you, briefly, how we did it. It was indispensable, in all the designs for the decorations, that they should be so arranged as to be easy of execution; that the important principle of "the greatest effect at the least cost," should be strictly attended to. Therefore, all ornament had to be done by stencilling, and all the colouring on woodwork was to be done in distemper. What the stencilling is I will explain presently. Distemper is a very ready means of colouring surfaces, because one coat of it bears out and gives a result more solid and more luminous than four coats of oil paint, but it has the disadvantage of not being preservative like the last, and it cannot be washed. Perhaps no one will ever discover the very rough state of the principals of the roof of nave, which are simply saw-cut, besides being blemished by the process of carting and lifting them. The

coat of distemper conceals all that. It is composed of whiting and size, made of any tint required by adding the usual colours.

Stencilling is performed by cutting out the pattern required in stout strong paper, which is then varnished over to strengthen and preserve it; taking care also to leave proper ties to keep the pattern together. But as example is better than precept, I have brought here a few of the stencils made use of for the decorations, and will show you how the work is done. (The workman here stencils some ornament.) I think that in the progress of the work more than 100 men must have been employed at this stencilling, out of whom, I have reason to believe, scarcely half-a-dozen ever did it before, and yet the work has been very well executed, and reflects much credit upon all those engaged upon it. I am happy to acknowledge the intelligence and perseverance of Mr. Hulsh, the foreman painter of Messrs. Kelk and Lucas, in directing these men. Also they will join with me, I am sure, in confessing how much they and I are indebted to the able assistance of my artist, Mr. Haeclin; nor can I be silent on the constant aid I have received from my eldest son, whose sketches on these walls will sufficiently speak for him. The task I undertook was attended with difficulties of what I may call a diplomatic kind. The contractors were at the expense of carrying out the work I directed, and were naturally not desirous to be wasteful; the Royal Commissioners wished the work to look as well as possible, therefore, it is easy to be imagined that where one side used the whip the other pulled the reins; nevertheless, I feel bound to state that the contractors desired to have the decorations of the building well carried out, and that they have been actuated by liberal and unselfish feelings.

I have little more to say, but there is one word of thanks I cannot but give expression to on this occasion; it is to acknowledge with gratitude the encouraging support I have derived from the criticisms on my work which have appeared occasionally in the *Times* newspaper.

In a few days the International Exhibition will be opened, the collected industry, science, and art of the whole world, thus brought together, will be opened to your view. I trust that they will in no way be injured by what I have done.

ARCHITECTURAL MUSEUM.

ON Tuesday evening a lecture was delivered in the theatre of the South Kensington Museum, "On Encaustic Tiles and Tile Pavements," by the Rev. Lord ALWYNE COMPTON. We shall probably give a report of the lecture in our next.

Reviews.

Returns Concerning the Assistant Commissioners of Education and Inspected Schools in the Ten Specimen Districts.

THESE Returns, issued by the Central Committee of Schoolmasters, are published to show the very remarkable difference which exists between the statements of Her Majesty's Inspectors and those of the Royal Commissioners with respect to the results obtained in inspected schools, which has been the occasion of great perplexity ever since the Report of the Royal Commissioners was issued. Her Majesty's Inspectors, who possess considerable experience, and have daily practice in the work of inspection and examination, state that the elementary subjects are taught excellently, well, or fairly, in 80 or 90 per cent. of the inspected schools. The Commissioners declare that these schools have succeeded in successfully educating only a very small proportion of the children who pass through them; and the question is asked, whence arises this discrepancy?

In order to assist in removing this difficulty, the Central Committee of Schoolmasters determined some time ago to send out circulars of inquiry to all the inspected schools in the specimen districts as far as these could be ascertained. Nearly three years have elapsed since the majority of the visits of the Assistant Commissioners to these schools were made, and during that interval numbers of masters and mistresses have left the schools where they were then placed, a few are dead, and some schools have been closed. But, notwithstanding these circumstances, about 220 returns have been received, and the answers contained in them will be found in the return. Every return received up to the moment of going to press has been inserted. Although the list is unavoidably incomplete, it is believed that sufficient evidence has been obtained to give a correct idea of the manner in which the Assistant Commissioners examined the inspected schools in their districts.

From these inquiries it is found that, of the schools from which returns have come to hand, 87 were not visited at all, 162 were not examined at all, while in very few schools were the lower classes even noticed.

The Central Committee are convinced that the following conclusions must follow from an examination of the returns which they have received and tabulated:—

1. That the lower classes especially were almost entirely overlooked by the Assistant Commissioners, even in the schools which they professed to examine.
2. That the examinations made by the Assistant Commissioners will bear no comparison with those of her Majesty's Inspectors, in respect to their thoroughness and reliable character.

3. That no trustworthy judgment as to the real state of the instruction in inspected schools could be formed by the Assistant Commissioners from the personal examination which they instituted.

4. That if the conclusions of the Royal Commissioners are worth anything, they do not derive their value from the examination of inspected schools by their Assistant Commissioners.

The returns are dated from the Committee Room, Whittington Club.

A Letter to the Right Hon. the Earl of Derby on the Proposed Memorial to the Prince Consort. Darton and Hodges.

THE writer of this letter, "Omega," contends that "no imitation should be admitted" in the design for the Albert Memorial, and that we should repudiate all heathen symbolism.

The characteristics of English modes of thinking, feeling, and taste, are simplicity, truth, meaning, purity. Our life is earnest, domestic, practical; our habits plain and simple; our actions devoid of all extravagance. Our most deep or vivid emotions are betrayed by no gesticulation or histrionic attitudes. We are unaddicted to pomp, pageantry, or finery. Magnitude, apart from utility, excites no admiration; greatness is never identified with mere vastness of size; hence the gigantic statues which occupy our public places move no feeling of awe, no sentiment of admiration (!)

The ideal of a monumental memorial of a Prince who achieved no military glory, who effected nothing great in political affairs, who did nothing which can be presented in a mechanical form, but who has impressed upon our fond memories that which is immeasurably better, is that it should be appropriate, unique, and calculated to excite the same feelings as would arise in his living presence.

In conformity with these sentiments, the proposed obelisk should be associated with sculptures simply and truthfully representing the man whose memory we desire to honour. These sculptures should speak to the eye and heart of every Englishman in language he can understand, refer to feelings and sentiments with which he can sympathise, furnish lessons which will impress themselves on his memory, and excite a beneficent influence on his conduct. They should be framed on principles now vital and active, neither brought from the past, nor anticipate an imaginary and unknown future.

What, then, should they be?

First, a mere monolithic obelisk, however vast, would scarcely afford suitable space for sculpture, except intaglio.

It should be a majestic pile, rising upon a basis formed with three gradients; thus affording twelve panels or surfaces for sculptures and inscriptions.

Upon the lowest and largest, on a level with the eye of the spectator, we would represent—

1st. The Prince, with the Queen and all his family—every figure of the exact size of life—portraits as accurate as possible, grouped so as to produce at once the most life-like and picturesque effect.

2nd. Another panel should represent the Prince with her Majesty and the group surrounding them—also of the exact size of life, at the opening of the Great Exhibition—the most prominent event in his life. There, the accessories, selected with care and taste, would tell unmistakably the story of the action.

3rd. On another should be represented some scene—an event of his public life—perhaps by the throne, in the House of Lords, where the Prince was by the side of her Majesty, to support and sustain, by his presence, a woman, in the performance of those exalted and onerous duties, which would seem to require fortitude and strength almost superhuman. This was, in fact, the function he so well performed, to the inestimable advantage of this great empire.

4th. The above can scarcely be open to differences of opinion, if the principles here enunciated are admitted. The fourth tablet may be open to discussion. We would again suggest that the Prince and the Queen should be depicted together. Should it be in their walks on the slopes of Windsor? or inspecting together his farms, or gardens, with their occupants he so well loved? We would only avoid such objects as dead game, or instruments of death. These may be pleasing to sportsmen, but would be out of place on our memorial.

The inscriptions should be

A simple, truthful, full narrative of the Prince's life, written with a sparing use of titles and epithets—such a life as his own refined taste would have approved, prepared with as much care as the sculptures. It may be brief in extent, though full, as comprehending every important fact.

This narrative should be engraved on the stone faces, in four languages—for the middle gradient, English, German, French, and Hindustani. Why this latter? it may be asked; is not this fantastical? It is the language spoken by a numerical majority of the Queen's subjects—that is my reason for selecting it. If this is thought insufficient, let another be chosen; but this, by employing a smaller character, might be in two forms, Hindi and Urdu, in the Persian and Nagree alphabets.

On the four faces of the upper gradient I would repeat the narrative in the four languages of the great literatures of the past—Hebrew, Sanskrit, Greek, and Latin. The reasons have been already stated—the memorial is for an incalculable future.

The author then refers to a question which we have already dwelt upon at some length in a recent number of the *BUILDING NEWS*. He says:—

To return to the idea of a vast monolith; would not the cost be far greater than commensurate? That with our wondrous mechanical powers we could excel the Egyptians in the magnitude of public works is obvious enough. Would it not convey an erroneous impression of our tendencies and taste to expend a vast sum on an object not involving any utility. Would it not, in short, be contrary to our tastes and habits? Would the wisdom of its builders be esteemed in the next generation, when the cost is told to the wondering spectator?

A more imposing structure could be erected, either of large masses of stone, or with a core or foundation of brick, cased with polished granite slabs, not less durable and far more magnificent than a monolith; but either is equally adapted to the realisation of our ideas. Might not the unsculptured shaft be a monolith with an elevated base, forming the gradients and spaces for the sculptures?

How to Double the Value of the Great Exhibition to Exhibitors and the World. By a Non-Exhibitor. Effingham Wilson, Royal Exchange.

THE writer proposes to achieve this modest undertaking by establishing a—

World's International Encyclopædia Company, limited liability, capital £100,000, in shares of £1 each, all to be paid up before April 15. Said sum to be placed at the disposal of a competent board of directors, for the purpose of carrying out, in six or more different languages, an Encyclopædia or Manual of the World's Exhibition. All profits arising from the same to be devoted to the formation of International Societies for the advancement of the arts and sciences. All losses that may accrue therefrom to be shared by the subscribers according to the number of shares subscribed for; and the whole or any balance that may remain at the closing of the said Company, in November or December, to be returned, with any interest which may have accrued while in the Bank.

The Encyclopædia is to contain descriptions of every article exhibited.

MONUMENT IN DERRY CATHEDRAL.—A monument has just been erected in the cathedral of Derry to the memory of Captain John McNeill Boyd, of the *Ajax*, who was swept off the pier of Kingstown and drowned while attempting to rescue the crews of some shipwrecked vessels during a hurricane on the 9th February, 1861. The body of the monument is of white marble. Captain Boyd stands with his right foot on a block of stone, and points with outstretched hand towards a ship whose bows and rigging appear rushing towards the rocks, directing five of his crew to fling the coils of rope with which they are engaged to the distressed vessel.

LITTLE CASTERTON FREESTONE.—The *Stamford Express* says—"That this stone is applicable to ornamental as well as to useful purposes is satisfactorily proved by a specimen of workmanship (intended for the Great Exhibition), which we had the pleasure of inspecting at the residence of O. N. Simpson, Esq. (the proprietor of this quarry), at Stamford. Instead of exhibiting a sample of the stone in the rough, Mr. Simpson has prepared a column, resting on a pedestal and surmounted by a cleverly-sculptured figure of an Angel, with expanded wings. Inscribed in colours on the column are the words 'Little Casterton Freestone.' The work has been executed by Mr. William Hilliam, of Stamford."

Messrs. Thurston and Co. have made a fine billiard-table for the Great Exhibition which exhibits some good specimens of carving. The design is Mediaeval, the eight legs of the table being composed respectively of groups of four columns each, highly ornamented with rich carving; the panels all round contain battle and other scenes connected with the wars of the Roses. The character of the design is in every part capable of receiving adornment. The table is of fine-grained oak.

IMPROVEMENTS IN BUILDING, &c.

ORNAMENTING WOOD IN IMITATION OF INLAID WORK.—T. Bray.

This invention is carried out as follows:—Firstly, the inventor takes glue, or any kind of glutinous matter, and reduces it to the consistency of jelly; then, with a soft brush, such as is used by painters, gives the clean wood one even coat. Secondly, he takes the following compound, gum shell, benzoin, and any soft gum which dissolves in spirit, saponin and spermaceti dissolved in pure spirit of any kind, and with this composition draws the desired pattern upon the wood with a pencil, or by the aid of patterns cut as stencil plates, or otherwise. Thirdly, he takes any colour or staining material dissolved in water, and with a brush or tool, such as is used by painters, he grains or stains the whole surface in imitation of the wood, marble, or other substances required to be imitated. Fourthly, he takes pure spirit, and with a brush saturates and washes the whole thoroughly clean, by which means the stain will be removed from the parts of the surface where the composition above mentioned has been applied, according to pattern, but the stain on the other parts of the wood will not be removed therefrom when the spirit has evaporated. He polishes the surface as may be required.

HANDLES AND KNOBS OF LOCKS AND LATCHES, AND THE MEANS OF APPLYING THEM.—J. M. Hart and R. Lavender.

Here, when two handles, one on each side of a door, are used, one of them may be made fast to the spindle, heretofore, and the spindle is formed square, or of other angular form, with a thread cut into the angles to a length likely to be required, and to receive a nut, the external figure of which corresponds with that of a recess in the knob or handle, or so constructed that the turning of the knob or handle will, whilst it turns the spindle, hold the nut from turning thereon. The rosette, or rose, on the inside of the fixed handle is provided with blades or projections in a radial direction, adapted to pass into corresponding saw-cuts in the door; or it is provided with other projections to pass into corresponding recesses in the door, to hold the rose or rosette from turning. At the other end of the spindle there is a supplemental or false rose, or a plate with similar projections to pass into suitable recesses on that side of the door. On the opposite side of this supplemental rose, or plate, there is a cylindrical projection with a thread on what may be called the rose proper, or visible, and which is held on to the neck of the knob or handle by a screw ring or nut, or other suitable means. The knob or handle is applied by the screwing-on of the visible rose or rosette on to the supplemental or false rose, or plate; or the rose proper may be attached to the false rose by studs, or projections from the one passing into corresponding receptacles in the other.

ROOF AND OTHER LIGHTS.—R. Smith, B. Brookes, and J. Smith.

As the frames of roof lights are at present formed, when the putty used to secure the glass to the frame cracks or separates either from the glass or frame, so as to admit water, that water may fall at once on to and injure objects beneath them. The object of these improvements is to remedy this evil, and for this purpose the patentees form the bars and other parts where they support the glass with longitudinal recesses or gutters, over which the edges of the glass are laid, and the glass is then retained by putty in the usual way, or by other suitable holding means. When from any cause the putty or other holding means admits water through it, such water, after passing under the edges of the glass, in place of dropping at once therefrom, will be received into the longitudinal recesses or gutters, and by them may be conducted to suitable channels or receivers.

GLAZING HORTICULTURAL BUILDINGS, &c.—T. G. Messenger.

This invention consists in laying glass in such wise that each edge of the glass (which glass may be of any required shape or size) shall lie on one side of an open gutter, which said gutter may form a gutter only, or it may form a gutter and rafter, either castor rolled in one or two parts; the said gutter is made to carry off all the condensed vapours from the interior, as well as the rain, &c.

SASH FASTENINGS.—W. Enlar.

These improvements in sash fastenings consist in forming the ordinary lever catch (which is fastened on the upper sash) with a projection or stud, by preference of a V or diamond shape, which (when the lever is moved under the locking plate) comes in front of an arm carried by a screw-nut on a thumb-screw attached to the lower sash, so that, by turning the screw a V or other shaped recess on the arm acts on the V or other shaped stud on the lever, and thus draws and secures the two parts of the window firmly together, by which all noise from the shaking of the parts will be prevented, and such fastenings will be more secure from being unfastened from the outside than heretofore.

BRICKS.—R. O. White.

This invention is applicable when burning bricks in open clamps or kilns, where fire is mixed with the brick earth, and is also interposed in between some of the courses. For these purposes, in order that the bricks may be more uniformly burned, and come out of an open kiln or clamp of uniform quality, the system of setting the bricks in "necks," heretofore practised, is got rid of, and the bricks are set in one direction in such manner that each course of bricks breaks course with the course above and below.

TREATING STONE, BRICKS, AND OTHER SURFACES, AND THE MANUFACTURE OF FILTERS.—F. L. Ransome and E. M. Ransome.

In treating stone, bricks, and other surfaces, the patentees employ powdered glass or other vitrified or hard substance, or powdered flint, stone, or sand, mixed with soluble silicate, with or without colouring matter, the object being so to apply soluble silicate that it may for the most part be retained in combination with the pulverised substance on the surface of the material to which it is applied. The compound of soluble silicate and pulverised matter or matters having been applied to the surface of the stone, bricks, or other material, the soluble silicate is then rendered insoluble in like manner to that practised when impregnating stone or other substances with soluble silicate; but by this mode the pulverised matters will be combined with the silicate.

SOUTH KENSINGTON MUSEUM.—During the week ending 5th April, 1862, the visitors have been as follows:—On Monday, Tuesday, and Saturday, free days, open from 10 a.m. to 10 p.m., 14,344. On Wednesday, Thursday, and Friday, students' days (admission to the public 6d.), open from 10 a.m. till 5 p.m., 1,166. Total, 15,510. From the opening of the Museum, 2,592,998.

ORDNANCE SURVEY.—A return has been published by order of the House of Commons, showing the manner in which the vote of £71,000 in this year's estimates for the Ordnance Survey is to be appropriated. The completion of the survey of England will cost £20,000; of Scotland, £20,000; and the revision or re-survey of the Northern counties of Ireland, £7,500. For the engraving and publication of maps £7,100 will be expended; while "presses for copper plates" will cost another £1,000. A last notable item is the grant of £6,000 for a "military survey round London."

A NEW LATHE.—A new lathe has been recently patented by Messrs. W. Muir and Co., of the Britannia Works, Strangeways. By an ingenious adaptation of two treadles, with alternate action, as much power is obtained for turning metals as with a steam-power lathe of the same capacity. We believe that this is an entirely new feat in mechanics—to obtain, without steam, as great a result, in cases in which power is required, as is accomplished by steam. Such a lathe will be of incalculable service on board vessels, and in those colonies—as India—where steam power cannot be easily procured, but where labour is cheap. The lathe will be shown at the International Exhibition.—*Manchester Guardian.*

TENDERS.

DWELLING-HOUSES, BARNET.

For erecting a house at Barnet. Mr. George Treddit, architect. Quantities supplied.
Hill, Keddel and Robinson £4,987 Longmire and Burge £4,589
Browne and Robinson 4,694 Patrick (accepted) 4,479

CHAPEL, LANCAIRE.

For the erection of the New Congregational Chapel and School, at Lytham, Lancashire. Messrs. Poulton and Woodman, architects, Reading.

Chapel.	School.
Todd £2,834 0	£221
Bamber 2,800 0	457
Clark and Jones 2,670 0	497
Tomlinson 2,536 0	482
Catterall 2,268 10	381
Cooper and Tullis (accepted) 2,125 0	416

UNION-HOUSE WORKS, WHITECHAPEL.

For the erection of a furnace-shaft and framing flue, &c., in connexion with the boilers, at the Workhouse, in Charles-street, Mile-end New-town. Mr. G. H. Simmonds, architect.
T. Mundy £310 S. and E. Jacobs £278
Pritchard and Son 286

CHAPEL, ISLINGTON.

For erecting new Congregational chapel, Baxter-road, Islington. Mr. William Smith, architect, 12, Copthall-court, City.
Dove Brothers (accepted) £3,550

DWELLING-HOUSES, PLUMSTEAD.

For erecting and completely finishing four houses at Eglinton-road, Plumstead, Kent, for Mr. John Trodd. Mr. William Gosling, architect.
Richards £1,849 Longman £1,380
Sutton 1,780 Smith 1,263
Bemister 1,575 Bailey 1,220
Lidbetter 1,475

ALTERATIONS, &c., ENFIELD.

For additions and alterations to Ordnance Arms, Enfield Lock, Middlesex, for Mr. W. M. Creed. Mr. William Gosling, architect.
Cook £337 Goffe £269
Bentley 315

ALL SAINTS' CHURCH, CAMBRIDGE.

For the first contract in the erection of this church. Mr. G. F. Bodley, architect, London.
Kiddle £6,200 0 Rattee and Kett £5,681 10
Smith and Co. 6,000 0 Bullock and Son 5,600 0
Bell and Son 5,900 0 Thoday and Clayton 5,400 0
Quinsee and Attack 5,700 0

DWELLING-HOUSES, LEEDS.

For four dwelling-houses, in Virginia-road, Leeds, for B. Nussey, Esq. Mr. George Corson, architect.

Accepted Tenders.

Digger, Bricklayer, and Mason.—Thomas Whiteley £1,235 0 0
Carpenter and Joiner.—Nicholson and Son 720 0 0
Slater.—W. Ellis 97 0 0
Plumber and Glazier.—T. Bedford 155 0 0
Plasterer.—James Branton 155 10 0
Smith and Bellhanger.—Singleton and Tennant 70 8 6
Painter.—Wood and Son 45 0 0

For dwelling-house, Clarendon-road, Leeds, for Rev. T. Hincks. Mr. George Corson, architect.

For Digger, Bricklayer, Mason, Slater, and Plasterer's Work.

Whiteley £547 Swale and Brown £501
Bedford 527 Woolley and Sons (accepted) 465
For Carpenter and Joiner, Plumber, Glazier, and Painter.
Winn and Pawson £401 10 Thorp £372 0
Nicholson and Son 380 0 Britton (accepted) 367 1

HOUSE, SURBITON.

For alterations and additions to house, Surbiton, for John Howell, Esq. Henry Jarvis, architect.

Pugh and Wallis £707 Mndie £644
Crawley 700 Johnson and Gibby 561
Marland and Son 685 Bottom and Co. 497
Tarrant 666

SHOPS AND HOUSES, WIMBLEDON.

For the erection of four shops and houses, at Wimbledon, for J. R. Andrews, Esq. Mr. Charles R. Gribble, Putney, architect.

Patman £2,783 Nicholson £2,590
Crouch 2,765 Avis 2,365
Myers 2,746 Adamson (accepted) 2,299
Downs 2,644

STABLING, &c., WANDSWORTH.

For stabling, greenhouse, and other works, at Southfield, Wandsworth, for G. Russell, Esq. Mr. Charles R. Gribble, architect, Putney.

Avis and Sons £513 Aries £467
Adamson 490 Strong (accepted) 463

COMPETITIONS OPEN.

CEMETERY WORKS.

CHELTEMHAM.—The Burial Board for the borough of Cheltenham require plans, estimates, and general specifications, for the laying out, constructing roads and footpaths, erecting buildings on, fencing in and planting, certain lands purchased by them for a cemetery, the superficial area of which is eighteen acres. The designs must include a ground-plan, showing the sites of the different buildings required, the courses of the carriage-roads and walks, the courses, also, of the drains, the division of the land into the several sectional burial-places, and the subdivision of such places into plots for burial. The plan, also, should show the manner proposed for the ornamental planting of the land. Should the intentions of the designers as to the laying out of the land render it necessary, sections of the earthwork required, and formation of the ground surface as proposed to be made, should be provided, and such other details and suggestions as the competitors may think necessary to illustrate and make clear their designs. Plans, elevations, and sections must be provided for two chapels, dead-house, lodge, gates, and walls at entrances, &c. Specifications must accompany the plans, describing the manner of construction, the class and substance of material in the several buildings, and estimates of their several costs. Plans, specifications, and estimates of the manner of laying out and planting the site, of forming and making the roads and footpaths, and of the character and cost of fencing the site, to be also provided. Plans, &c., may be either for forming and finishing the roads and footpaths, laying out and planting the site, or for fencing the site, or for the chapels and other buildings before

mentioned, and the entrance-walls and gates, or the whole of the works, may be combined in the plans, &c., of any competitor; but the Board reserve the right of selection at their discretion from the plans, &c., submitted to them. A premium of forty guineas will be given for the best designs, specifications, and estimates for the whole of the works sent in; and a premium of twenty guineas for the second-best designs, specifications, and estimates for the whole of the works. Should designs, &c., be selected for part of the works only, a fair arrangement as to the premium will be made by the Board, with the successful competitors. The plans, &c., selected to become the property of the Board. The plans, &c., are to be distinguished by a mark or motto, and accompanying them a sealed envelope, having the same mark or motto outside, and within the name and address of the designer, and the terms on which he will superintend and supply his professional services in execution of the works. Plans and particulars of the land may be had of Mr. Henry Dangerfield, borough surveyor. The plans and other documents to be sent to G. E. Williams, clerk to the Board, Public Offices, Cheltenham, on or before the 29th May.

SCHOOLS, &c.

DURHAM.—Plans and elevations are wanted for schools and teachers' residences, in conformity with the rules of the Committee of Council on Education, at Stockton-on-Tees, Durham. The boys' school to accommodate 250; the girls' school, 200; and the infants' school, 200. Three teachers' residences. Ten pounds will be given for the most approved set of plans. Further information and tracing of site may be obtained of William Skinner, Esq., Stockton-on-Tees, to whom plans, with estimates of costs, must be sent, not later than the 30th April.

LIBRARY AND READING ROOMS.

BIRMINGHAM.—The Free Libraries' Committee of the Council of the Borough require plans, sections, specifications, and estimates for the erection of a free reference library and reading-rooms, lending-library and news-room, and gallery of art, upon the piece of vacant land adjoining the Midland Institute Building, with an elevation uniform with the said building. Intending competitors are requested to send in their plans, specifications, and estimates, under cover to Thomas Standbridge, town clerk, Town clerk's office, Temple-street, endorsed "Plans for Free Reference Library Buildings," on or before the 16th June. Particulars of the accommodation required, and of the conditions of competition, together with a lithographed plan of the site, may be obtained on application.

CHAPEL.

LEICESTER.—A premium of ten guineas is offered for the best design for a Wesleyan chapel, to be built in Leicester, capable of holding 900 persons. Architects wishing to compete may, upon application to Mr. H. Wale, 56, New-walk, Leicester, receive a plan of the site, and instructions and any other information required. The plans to be forwarded, carriage free, addressed to Mr. H. Wale, on or before the 1st May, accompanied with a sealed envelope, containing the architect's name, and bearing a motto corresponding with one to be placed on his design.

CONTRACTS OPEN.
CLUB HOUSE.

DUBLIN.—For intended alterations and additions to the 'Stephen's-green Club House' according to plans and specifications prepared by John S. Butler, Esq., architect. To be inspected at his office, No. 16, Hume-street, Dublin, up to the 23rd of April, on which day proposals are to be furnished.

ASSEMBLY ROOMS.

STAFFORDSHIRE.—For the erection of the Silverdale Assembly-rooms. Drawings, &c., at the Silverdale offices, Newcastle-under-Lyne, size of room 60 feet by 38 feet. Tenders post-paid, to the secretary, on or before the 21st April, 1862, sealed and endorsed "Tender for Assembly-room."

LUNATIC ASYLUM.

PRESTWICH.—For the erection of two blocks of buildings proposed to be added to the County Lunatic Asylum, Prestwich. Plans, &c., and other particulars obtained by applying at the offices of Charles Holt, architect, Nelson-square, Bolton, to 16th April. Sealed tenders, addressed "Tender for additions to Prestwich Asylum," to be delivered at or before nine a.m., on April the 18th, to Mr. F. C. Hulton, solicitor, Salford.

CHURCHES.

MONTGOMERYSHIRE.—For the erection of a new church at Bwlch-y-Cibau, in the parish of Meifod, Montgomeryshire. Plans, &c., on application at the schoolhouse, Bwlch-y-Cibau, six miles from the Llanymynech station, and nine miles from Welshpool. Further particulars by applying to the architect, G. G. Scott, Esq., 20, Spring-gardens, London. Tenders to be sent in on or before the 22nd April, addressed to the Rev. R. Wynne Edwards, Meifod Vicarage, Welshpool, and endorsed "Building Tender."

BERKS.—For restoring and part rebuilding the parish church of Wokingham. Berks (where there is a junction station of branches of the South Eastern and South-Western Railways). Plans, &c., at the office of Mr. W. W. Wheeler, solicitor, Wokingham, till the 13th. Sealed tenders directed to Mr. Wheeler, on or before the 29th inst.

LANCASHIRE.—For the several works to be done in the erection of St. Saviour's Church, Bacup, Lancashire, of which the foundations are just completed. Plans on application to Mr. Robert Howarth, at Stubbylee, Bacup. Tenders, either for the whole works or for the several portions, must be delivered to Edward Wyndham Tarn, architect, Huddersfield, at Stubbylee, before one p.m. on the 23rd inst.

CHAPEL.

DEVON.—For the erection of a congregational chapel at Whimble, Devon. Plans, &c., with W. F. Cross, architect, 6, Queen-street, Exeter. Tenders to be delivered on or before the 16th April.

SCHOOLS.

WHALLEY RANGE.—For all the works required in the erection of St. Margaret's schools, Whalley Range. Particulars at the office of the architect, W. Wilkinson Whitaker, 32, St. Anne-street, Manchester. The estimates to be forwarded to the architect on or before the 17th April.

NORTH-TAWTON.—For the erection of a school-house and residence, at North-tawton. Plans, &c., at the office of the secretary, Mr. Falford Vicary, at the Factory, North-tawton. Sealed tenders, endorsed "Tender for North-tawton School," to be sent to the secretary, on or before the 16th April.

PARSONAGE.

SURREY.—For the erection of a parsonage, at Thursley, Surrey. Plans, &c., on application to the Rev. H. Branner, Thursley, near Godalming, Surrey, or to Mr. J. W. Penfold, architect, 2, Charlotte-row, Mansion-house, E.C., of whom the quantities may be obtained, price 1/6s. each. Tenders (on a printed form), to be sent on or before 12th April, to the Rev. Henry Branner.

DWELLING HOUSES, &c.

IRELAND.—For the erection of a dwelling-house, near the town of Bawnboy, co. of Cavan, according to plans and specification at the office of Mr. William Doolin, building surveyor, 27, Talbot-street, Dublin (where detailed bills of quantities may be obtained) up to the 14th April, when the proposals are to be forwarded, sealed and prepaid, to Mr. William Hagg, Jun., architect, Cavan.

CHIPPING NORTON.—For alterations and very considerable additions to a residence at Chipping Norton. Plans, &c., at the offices of Messrs. Gibbs, Thompson, and Colbourn, architects, Stratford-upon-Avon, until the 23rd inst., where the quantities, &c., may be had on payment of 10s. Tenders to Messrs. Tilsley and Wilkins, Chipping Norton, on the 23rd April.

FACTORY.

NORTH WALES.—For the erection of a factory for Patent Oilworks, at Coed Talon, near Mold, North Wales. To communicate, by letter, with Messrs. Bevington and Topham, engineers, Spa-road, London, S.E.

POLICE STATION.

DEVON.—For the erection of a police station, &c., at Holsworthy, Devonshire. Plans, &c., with Henry Ford, clerk of the Peace, Castle of Exeter, and at the office of Mr. A. Coham, Clerk to Justices, Holsworthy. Sealed tenders, endorsed "Tender for Holsworthy Police Station," to be sent to Mr. Ford, on or before the 29th April.

FARM BUILDINGS.

SALOP.—For the erection of a farm-house, farm buildings, and three cottages, at Walton, near Much Wenlock, in the county of Salop, for the Right Hon. Lord Forester. Plans, &c., with Mr. Robert Griffiths, architect, Bridgnorth, until the 19th April, on which day tenders must be delivered to the architect by 12 o'clock. Persons intending to tender to send their names either to the architect, or to his lordship's agent, William Thurstfield, Esq., Barrow, near Broseley, Salop, so that a time may be appointed for viewing the site and plans.

RIVER WORKS.

CAMBRIDGE.—For the repair of the walls of Baitesbite Sluice (about three miles below Cambridge), and for supplying the same with new oak doors and floodgates for the Sluice Pen; new bridges over the floodgates and overfall, and other works. Specification with Clement Francis, Clerk of the Conservators, Cambridge. Sealed tenders to Mr. Francis, on or before the 30th inst.

ROADWORK.

CHIPPENHAM.—For the repair of the Chippenham turnpike roads, about 17 miles, for a term of years from the 1st day of June next. Specification at the office of the clerk, and copies furnished at stationer's charges. Sealed tenders, stating terms, must be delivered to the clerk, before twelve noon, on the 25th inst.

RESERVOIR.

FYLDE.—For the construction of a reservoir, upon the Grizedale Brook, about three miles from Garstang, and near Scorton Station, on the Lancaster and Preston Railway; and a reservoir near Weeton-lane Ends, about three miles from the Kirkham Station of the Preston and Wyre Railway, for the Fylde Waterworks Company. Plans, &c., and all information obtained at the office of Mr. T. B. Foster, C.E., 23, John Dalton-street, Manchester, from whom specifications and forms of tender can be obtained on payment of 10s. for each reservoir. Tenders must be sent in to Mr. T. A. Wilkinson, the secretary of the Company, at the Fylde Waterworks Office, Kirkham, not later than the 28th inst. The reservoirs will be let in separate contracts.

GASHOLDER.

TODMORDEN.—For certain works required in the extension of the works of the Todmorden Gas Company (Limited), consisting of a stone gasholder tank and bur wall. Plans, &c., on application to the Manager, to whom sealed tenders are to be sent on or before the 17th April, endorsed "Tender for Gasholder Tank."

RAILWAY WORKS.

LEYEN AND EAST OF PIPE RAILWAY.—For the construction of the extension of the East of Pipe Railway, from the Kilonquhar Station to the town of Anstruther, either as a whole or in the following sections:—1. The Elie Contract, extending from the commencement of the extension near Kilonquhar Station to a point near Ardross Farm-house, and to about 4,325 yards in length. 2. The St. Monn's Contract, extending from the termination of Contract No. 1 to a point near the west boundary of the parish of Pittenweem, and to about 3,109 yards in length. 3. The Pittenweem Contract, extending from the point where Contract No. 2 terminates, to a point near the milestone at the west end of Anstruther-Wester, and to about 3,750 yards in length. The rails, chairs, sleepers, keys, and spikes will be furnished by the Company. Plans, &c., with the Secretary of the Company, at Leven, and the line is duly marked and staked out for inspection. Sealed tenders, either for the whole work or for one or more of the separate sections, distinguished by a marking on the envelope, must be lodged with the Secretary of the Company on or before 16th April.

CALEDONIAN RAILWAY.—For the construction of the Stonehouse Branch, about 4 miles 38 chains in length. Plans, &c., at the office, in Glasgow, of Mr. George Graham, the Company's engineer, where duplicate schedules and blank forms of tender may be had, price one guinea. An assistant engineer will attend at Stonehouse, on Friday, the 11th, at 12 o'clock, to accompany intending offerers over the line. Sealed tenders, addressed to the secretary, at Glasgow, must be lodged with him on or before 28th April.

DARLINGTON.—For the erection of a cast-iron portico at Darlington Station, on the North Eastern Railway. Plans, &c., and further information, on application to Mr. Prosser, architect, Newcastle. Sealed tenders, marked "Tender for Darlington Station," to be sent in to the Secretary not later than the 23rd inst.

FERRYHILL.—For the erection of sheds over the platforms, &c., at Ferryhill Station, on the North Eastern Railway. Plans, &c., and further information, on application to Mr. Prosser, architect, Newcastle. Sealed tenders, marked "Tender for Ferryhill Station," to be sent in to the Secretary, not later than the 23rd inst.

EXETER.—For the erection of a roof for the new station at Exeter, of the Bristol and Exeter Railway, having an area of about 500 squares. Drawings, &c., at the Engineer's Office, Bristol Terminus, to the 5th of May. Sealed tenders to be addressed to the Secretary, A. Moore, Esq., on or before the 6th May.

CAISSON.

FALMOUTH.—For the construction and delivery of a wrought-iron Caisson, for No. 2, Graving dock, Falmouth. Drawings, &c., at the offices of the Docks Company, at Falmouth, or of James Abernethy, Esq., M.I.C.E., 3, Parliament-street, Westminster. A printed form of tender will be supplied, which must be filled in and delivered at the offices of the Company, on or before the 18th April.

MILITARY WORKS.

YORK.—For building a provost establishment at York Cavalry Barracks. Parties desiring to tender must leave their names at the Royal Engineer Office, York, on or before the 15th April, and pay half-a-guinea for bills of quantities.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications. Works in Progress.—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

W. G.—Publication of letter would do no good; the question is already decided.

B. L. (Worcester).—Slabs of enamelled slate would probably answer best; glazed tiles would answer for a time, but in the case named they would probably require occasional repair.

O. S. (Stamford).—See another page.

AN ARCHITECT AND SUBSCRIBER.—An exceptional and doubtful case, in which we cannot interfere.

C. E.—See notice on another page.

G. AND C. H. (Stratford-upon-Avon).—Ditto.

R. B. (Worcester).—We shall be glad to see anything you may send us.

K.—We must always decline such proposals.

G. H. R. T.—Shall appear.

AN EXHIBITOR.—Send name and address.

MR. SKIDMOORE'S LECTURE ON METAL WORK.—In answer to several correspondents, the lecture will be given in our columns as soon as the illustrations can be prepared; this will necessarily take a week or two.

F. K. M.—Thanks: shall be engraved.

B.—Next week.

A SUBSCRIBER FROM NUMBER ONE.—All in good time.

A CONTRACTOR.—Undoubtedly you have your remedy.

Q. H.—Yes, if suitable. We cannot name the writers of articles which appear in our pages.

F. M.—Declined, with thanks.

W. R. O. M.—Shall hear from us.

A. (Bath).—Deferred for want of space.

* * * All communications to be addressed, The Editor of THE BUILDING NEWS, 20, Old Boswell-court, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 15 to 21, Old Boswell-court. Advertisements are received up to six o'clock on Thursdays.

THE CHAMBERS' SUPPLEMENT.

Those Subscribers who have not yet received the completion of the above will receive them in few days.

ART EXHIBITIONS.

THE present is an age of many novelties, and among its many remarkable characteristics we must certainly include exhibitions. We are familiar with the display of articles of all descriptions, natural and artificial, in markets and shops for sale. We can also carry back to early times the custom of collecting in one spot articles of luxury and beauty, with the object of adding lustre to some imperial court or some sacred shrine. We have, too, for long been accustomed to the formation of permanent museums and collections, where natural, scientific, or antiquarian curiosities may be preserved as objects of study and interest; and we can carry back to remote days the establishment, for similar purposes, of public libraries and reading-rooms. Our modern exhibitions differ, however, from all these. They present a marked contrast to all museums, galleries, churches, palaces, and collections, because they are temporary (such as, for instance, the great fairs of the middle ages), by not being solely—in some cases not chiefly—established for the sale and purchase of articles exhibited; and in this and some other respects they are also markedly distinct from shops, bazaars, and exchanges.

The exhibition is, then, an institution of the nineteenth century, and as such interesting, as illustrating some of the characteristic peculiarities of the age in which we live. Let us examine a little into the nature of some of the sorts of exhibition now familiar to us.

The earliest, and the most important, exhibition to which we shall have occasion to refer, is the annual exhibition of the Royal Academy, the forerunner of many other annual exhibitions of painting and sculpture. This has always been and still is a temporary collection of works of art assembled together for the purpose of exhibition during a few months of the year, and then again dispersed. This exhibition has undoubtedly served very largely as a medium for the sale and purchase of pictures, but neither the artists nor the public have supported it solely, or even chiefly, on that account.

To the artist the exhibition is valuable as a means of bringing his works before the public, of gaining reputation, and in some cases—especially in the instance of men of rare genius and a noble temper—as a precious opportunity for showing or doing something noble or great, and for touching the hearts of spectators by some painted poem or sculptured story which, urged by the natural eloquence and earnestness welling up within him, the ardent enthusiast cannot but proclaim, and for which he longs to get hearers. Of the spectators, not one in a hundred comes to buy or does buy; the intention is to see and to admire, and to be pleased, or to criticise and play the judge of art. And if there are here and there artists high-souled enough to paint, not so much in order to win money as because they must pour out the overflowings of their rich genius and endless fancy, and cannot forbear, we believe that many of those who most value those annual exhibitions of works of art, among which the Academy is the earliest founded and the most distinguished, do so because of the opportunities thus offered of being elevated, charmed, or touched by the poetry that they can find in the works of the artists with whom they have special sympathy.

To bring the painter and his audience together is, then, the object of the modern system of exhibitions; out of this audience, one here and there may buy, but the many will only admire; and it is as much on account of the many, as of the one or two, that the arrangement was made and is kept up.

The printing-press has been the chief means of bringing the author and the poet into contact with their audience; but the dramatist and the musician have always had to display their works, or cause them to be displayed, by recitation or performance before their audience; and it is to provide something of this sort for painting that art exhibitions have been originated.

It may be asked, however, why is it that in the Middle and Renaissance Ages, when artists flourished, greater far than ours, and when cities like Rome, Florence, and Venice contained crowds great enough to furnish such exhibitions with guests, no such exhibitions arose? The reply is twofold. First, the great and intellectual judges of art were probably then confined to an infinitely narrower range than at present, so that the wealthy, the educated, and the men of leisure could be seen in their own houses, or could see works of art in the studio of the artists themselves, and they having seen them, the artist's critical audience and those from whom his remuneration flowed were secure. Second, and chiefly, as far as related to painting for the people, or carving for them, or teaching them with the brush and the chisel, the artist of those days had an infinitely better channel of doing it open to him than our modernism, with all its improved civilisation, can afford. When all the greatest works of art were executed in the service of religion, and were painted on the very walls of the church, or graven in its very fabric, what need, or what possibility, was there of any better mode of letting the picture tell its tale than painting it where,

from day to day, it was to be regarded with sentiments of awe and wonder something akin to worship, and was, amid the sacred objects of the sanctuary, to take its place as one of the appointed means of impression, instruction, or comfort?

The few artists of our own day and country who have the opportunity of painting such pictures as the Early Church pictures were, and of having such an audience as this, show, by their carelessness about exhibiting elsewhere, how much the value of ordinary exhibitions is superseded, in their eyes, by the special opportunities they elsewhere enjoy. If we miss Cope, Herbert, Dyce, and some others from the Academy walls, it is because they paint pictures that will hang in a more congenial situation than any they could there find.

There is one very large class of pictures, and an essentially modern class, which would of themselves alone suffice to maintain our exhibitions, even if all our historical painters were away. Landscape-painting is eminently the growth of modern Europe, and can never become the appropriate decoration either of churches or public buildings. Such poetical landscape-painters as Turner, Danby, Creswick, David Cox, and others, have established a magnificent school, which will always furnish works for which their producers will desire, not merely opulent purchasers, but many spectators, and the great advances landscape-painting has made has been one of the main causes which have contributed to foster the growth of our annual exhibitions of pictures.

Within our own day we have witnessed the establishment of the system of local, provincial, national, and international exhibitions of arts, manufactures, and fine arts. To an historian these will be significant marks of the wealth and intelligence of Europe, of the earnest desire of all classes for comprehensive information, and of the strong conviction on the part of the producing classes and of Governments that publicity and good fame is all important for the well-being of manufacturers and manufacturing states.

At this moment private individuals and foreign Governments are spending sums which, in the aggregate, will amount to many hundreds of thousands, and are depositing articles, the value of which will amount to many millions, in order to promote an International Exhibition of the most comprehensive nature; and within the next few months vast sums of money, and an amount of valuable time which, if aggregated, would seem incredible, will be devoted by individuals of all classes to the appreciation of this vast collection. Nothing is more remarkable than the purely voluntary nature of the whole. Of course, many individuals may here and there say with truth, that they are exhibitors or spectators not voluntarily, but because they could not help it; but the real pressure upon them, whatever particular form it may take, is really a pressure of public opinion; and were not the whole mass of civilised humanity voluntarily inclined towards such undertakings, no power could by any possibility, or with any amount of force, accomplish the tenth part of what is now being cheerfully and eagerly done by volunteers, or could approach to it.

It is not now our intention here to attempt to consider this very interesting subject of national exhibitions of arts, manufactures, and industry in all its bearings, or, in fact, to notice more than one solitary peculiarity which it presents, and which has to do with our subject.

From the scheme of the International Exhibition of 1851 the *fine arts* were excluded. This glaring mistake was far less palpable than it might have been, owing to the happy accidents that very many of the objects of industrial art exhibited were of a high class of artistic design, and that many works of fine art, particularly of sculpture, obtained admission by various side doors. Had this not been the case, and had not the interest and novelty of the undertaking been such as they were, we doubt that the absence of such a department as was supplied at Paris in 1855, and is to exist at Kensington, would have been felt as a great defect. Felt or not, it was a defect, and the fact of its being the principal addition to the scheme of the previous one is a significant collateral proof of our statement, that exhibitions of fine arts are an essential feature of the present day, and will probably continue so for long to come.

We may be thought to be passing from one extreme to another if we pass from the great collection at South Kensington, including as it will a comprehensive series of architectural designs, to the modest dimensions and claims of the Gallery in Conduit-street. The Architectural Exhibition has, however, very peculiar claims both upon architects and others, and we cannot more appropriately bring these observations to a close than by showing how well it deserves support.

The works of the architect are, it is true, usually such as when completed are either wholly or partly open to public observation; but the positions where they stand are quite beyond his own control, and many really fine works are so placed that unless they are known of and sought for few of the educated public would even see them. While it is only by a laborious and careful study of many works that either an architect or an ordinary spectator can, without an exhibition, form a correct idea of the general course of the art from year to year. Now, this opportunity the Architectural Exhibition is established to give, and does give, and if now the number of visitors be but moderate, we may safely answer that it is *only* because the number of exhibited works is small also. Let every executed work of importance or remarkable design find a place there, and every amateur whose opinion is of any value will come to look at them.

The great stumbling-block is the necessity, as it is supposed, of making up showy, and consequently expensive, perspective drawings of any architectural object to be exhibited.

This necessity does not exist; it is quite true that spectators enjoy a

perspective view in preference to hard and crude geometrical drawings, and it is equally true that a faithful perspective shows the solid effect of a building extremely well; but where no other object except that of making an exhibition drawing has rendered the setting up a perspective desirable, we apprehend that a well-finished series of geometrical drawings, especially with a little aerial perspective introduced in the tinting, will answer every purpose; and for this object good working drawings, or careful tracings from them, would often suffice.

At any rate, we must urge it strongly upon the attention of architects that as the Exhibition of Architecture has, perhaps fortunately, seemed to detach itself from the Royal Academy, and from other exhibitions, it is their duty, and will be their greatest wisdom, to raise it to the rank of one of the leading annual collections, both in extent, importance, and popularity. We do not urge that heavy expense should be incurred in the preparation of special drawings or photographs, but we urge architects to take care that the drawings by which they make clear their designs to their clients and their artificers should be such as will also make them clear to the general public and to architectural spectators, and then to exhibit them; and in sanction of such a course we may remind our readers that the recent award of the Society for the Promotion of the Fine Arts, of a medal for the best exhibited architectural design of the past year, was obtained by Mr. Blomfield, for a church not drawn in perspective at all, nor even drawn at all, but merely shown by a frame of careful mounted tracings, taken from the working drawings.

THE ALBERT MEMORIAL.

THE subscriptions for the memorial to the late Prince Consort are getting less and less in amount as Time—the great consoler—renews its healing balm to the sharp wound which the nation so suddenly endured. They now, together, approach £50,000. Beyond that sum we are hardly justified in hoping that they will advance. This fact has called forth complaints from some of the Committee at the lack of public appreciation of the Prince's services, and suggestions from others for infusing new life into the movement, and for directing it into a different course. It is said that appeals have hitherto been made only to the higher and wealthier classes; that an examination of the subscription list shows many rich men's hundreds but few poor men's pence. We are reminded that the good Prince's labours and talents were daily devoted to the amelioration of the sufferings of the poor, and that little gratitude has burst forth to mark where the seed was scattered. There is some truth in this statement, but not the whole truth. We do not care to analyse the subscription list, and to nail up the absentees. Every man has an equal right to withhold and to give what he believes he can afford. If we were, however, to hunt through the pamphlet which the Lord Mayor has so extensively circulated, we should be able to sustain an opposite conclusion to that put forth. A comparison of the list with the Court Guide would show that the one is not a mere reprint of the other, with valuable appended figures, and that their relative thicknesses is as a scrap of gold leaf to a guinea. Every inhabitant of London whose name is printed in that choice volume, has once or twice been startled with a dignified announcement from a special messenger that the letter presented was "from the Lord Mayor." Daily advertisements in the *Times*, and periodical voluntary notices in every other newspaper, chronicle the progress of the subscriptions, even as they previously announced the intention of forming a fund, and the object to which it is eventually to be devoted. No person can possibly be ignorant that a committee sits, and that the list is enclosed. The amount yet received is not so large as was expected, more especially by those gentlemen who started at the same time such gigantic propositions for absorbing it. A feeling of disappointment certainly pervades society at the result; but the fault, we believe, is less with the public than with those who made some little capital out of the concern by creating extravagant expectations, and put forth preposterous assertions of what it would and ought to be. No one can justly accuse the nation of being insensible to the appeal made to it.

The circumstance of the Hartley Colliery accident intervened, and no doubt diverted some portion of the spare cash which would otherwise have been given to the Prince Consort's Memorial; but although the circumstance is to be regretted, the result of it cannot be. The need of those widows and orphans was pressing. With the wail of the bereaved was blended an appeal for bread. The mourning there was in desolate cottages, and the tears fell from eyes which knew not where else to look for succour than to their sympathising fellow creatures. The grief at England's and England's Queen's loss was deeper and more solemn, but it was less acute. The need for sacrifice was not urgent in the latter as in the former case; it would have spoken trumpet-tongued for our loyalty, but for no other sentiment if the cause of the Northumberland widows had been sacrificed to the wish for a monolith in Hyde-park. But when the sum of £50,000 is called unworthy of us as a nation, it is well to inquire what has been raised to provide memorials for other great men whose deeds illumine the annals of our country. Let what public monuments we have of Nelson, "the nation's darling," of Wellington, the "saviour of the world," of Shakspeare, Milton, Bacon, or of the Prince Consort's great prototype, the "blameless" Alfred, be the answer. It cannot be unworthy of a nation to do more for the perpetuation of the late Prince Consort's memory than it has done for either of these; and when it is charged against the working and labouring classes that they have done little or nothing to show their appreciation of his worth, it should be remembered, in extenuation of their neglect, that it was not in the Prince's nature to court that popularity which adulators would attach to him. His was the nobler mission to do good for its own sake, to obey the instincts of a lofty refined mind and of a

warm sensitive heart, conscious, perhaps, that the less educated people for whom he worked would not do him full justice; contented, it may be, if he won, as he did win, their respect and esteem, and if he overcame, as he really did, their prejudices against him. No great man indeed was ever prized at his full worth in his own time. To measure his goodness one needed to have scaled the same lofty height; to have fully appreciated him we must have more resembled him than we have done. Whenever, in future ages, a pigmy struts where once this giant marched, we may indeed turn back to our history and dwell lovingly upon the bright page which records his services. Then, perchance, the humblest amongst us may compass his value.

In the case of the Hartley Colliery accident a chord was struck in every beating heart in England. It was the same with the public contribution for the widows and orphans of the Crimean soldiers. All classes could understand those objects. They required no great intellectual qualities for their comprehension. They seemed personal to every one. All classes did not, on the contrary, understand the late Prince Consort. It is no disparagement either to him or them to state the fact. Many again who were capable of estimating the value of his services had objections, which we have a right to respect, to the proposed form of the memorial. The lukewarmness of many was chilled when the freezing news came forth that the obelisk was to be monolithic, and that more money than had been at that time subscribed would be spent upon machinery to raise, instead of upon art to embellish, it. The decision of the Queen in favour of an obelisk was asserted, by some too-influential people, to mean a monolithic obelisk. We at the time pointed out the folly of appropriating so large a sum as would be required for transport for the attainment of so small an idea. In face of the slackening tributes to the fund, the absorption of all local funds was suggested, but with the result which all must have anticipated, except those who gave rise to it. Not a penny we believe has been gathered thence. The folly of the monolithic proposition was followed by these invitations to local committees to sacrifice their little collection upon the metropolitan Mutt-fetched block, and by complaints at the stinginess of the middle and working classes.

Running in the same narrow groove comes a suggestion that the begging-box and the begging-list should be distributed broadcast over the land. Collection cards are, it is proposed, to be issued to the members of the Committee and their friends, to the societies in connection with the Society of Arts, to railway companies and bankers, to large manufacturers, to the heads of Government offices, and to ladies' committees. Appeals for voluntary contributions having failed to satisfy the sanguine, the screw is to be put on by an appeal to our vanity. Our unwillingness to refuse compliance with the request of some one in authority, whether master or middle-aged spinster, is to be tested. We thought this practice was devoted exclusively to missionary enterprise. We have all, perhaps, once, or oftener, in our lifetimes stumbled unintentionally into a family where mamma and Miss Jane devoutly employ their powers of persuasion on behalf of pet infidels, and where even a toddling child, who does not know its letters, rattles its box and begs for "sixpence to convert Timpnttew." It is our own fault if we again cross the path of these merciless highway-women. We have even known boys at school filched of their pocket-money, under similar pressure, to buy breeches for a tattooed foundling in some unheard of region. A wandering missionary told them the tale of his discovery, and proposed two weeks' contribution from every boy. The inference which might be drawn from the lads' refusals forced them to a sacrifice which, voluntarily, they would not have made, which ought not to have been placed before them, and for which the shrewd proposer was patted on the head by the missionary as a "pattern boy."

Now, this is precisely the result of these "collecting cards," but, instead of its being confined to an occasional house which a man may now avoid, it is to be forced upon us from all points of the compass. It is a small-meshed net which no fish can escape, and out of such materials the "voluntary" tribute of a nation's gratitude is to be reared. Money, thus raised, might fitly be squandered upon the transport of a huge stone; it would be degrading to the Prince's memory to adorn his monument with it. It is now, however, rumoured that the unsoundness of the Mutt block will necessitate an abandonment of the monolithic idea. We really hope such will be the case. Let us have an obelisk, since her Majesty wishes it, but let it be an artistic one, proportionate to the disposable fund. We want to hear no more about the backwardness of the working or any other class, and to see no begging cards; we only hope that the best man or men to execute the work will not be kept back, and that we shall see an ornament to the Park instead of a huge curiosity. If the artistic class are consulted, it will be found, we believe, that even with an outlay of £50,000 we can possess a monument far superior to anything which has yet been reared to the honour of England's worthies, and consequently not unworthy of him whose memory dwells with them in our hearts.

CITY IMPROVEMENTS.—The General Purposes Committee have reported to the City Sewers Commission that they have arranged with the parish authorities of Allhallows, Barking, to carry out the improvement by widening Barking-alley round the churchyard, and also that they had negotiated, through the solicitor and surveyor, in respect to the proposed improvement in Paternoster-row and London-house-yard, and expected that they would be enabled to report to the court that the whole of the arrangements for opening the court from Paternoster-row to St. Paul's-churchyard had been satisfactorily completed. Mr. Pearson, the City Solicitor, subsequently reported that the arrangements had been completed.

ARCHITECTURAL EXHIBITION.

THE show of Ecclesiastical designs at the Architectural Exhibition is, we should think, equal in point of numbers to what it has been on former occasions; but here its equality ends. One would imagine, from an inspection of the fifty or sixty designs in the Gallery, that the study of Gothic art had not only been checked but had actually retrograded to the starved, hard features of twenty years ago. There is none of that art to be seen which was carried nobly to the front at Lille and Hamburg, which confidently entered the lists against all comers at Westminster Hall, and triumphantly issued thence. By the Architectural Exhibitions of former years we have been able to measure the growth of architecture. It would appear that a blight has this year fallen upon the profession. Messrs. Burges, Clutton, Deane and Woodward, Seddon, Gilbert Scott, Norman, Shaw, Nesfield, and others, who have heretofore made the walls sparkle with vigorous and healthy Gothic art, leave the work now to feeble hands. The Classic men are equally neglectful or indifferent. Messrs. Coe, Garling, Allom, E. M. Barry, Owen Jones, and Digby Wyatt, are names looked for in vain in the present catalogue. We say nothing of the greater dignitaries of the profession. We should be as surprised to see them in Conduit-street as we should to see princes mingling promiscuously amongst a crowd of working men; but we had a right to expect more than the "one halfpenny worth of bread to such an intolerable deal of sack" as is here provided for us. The church designs seem to have been prepared entirely after the old-fashioned prescriptions. A certain proportion of crockets, pinnacles, traceried windows, pointed arches, buttresses, gables, and broche-spires are shifted and put together with scarcely more art than is displayed by children with their geometrical toys. The studies of existing buildings, with one striking exception, are also unequal to those of former years. Mr. Vaughan sends, as usual, a collection of sketches. They are highly finished, but there is a want of vigour about them, and they occasionally, we fancy, betray the peculiar distortion of the camera lucida. Mr. Beazley's sketches in France and Italy are splendid specimens of pencil work, as well as of architecture. They are firmly drawn, unfinished, but sufficiently so to enable us to realise the grandeur of the different subjects. The points of view are, moreover, admirably chosen.

The design submitted in competition for Rashcliffe Church by Mr. Sorby is spoilt by the chimney from the vestry, which runs up beside the tower. It is bad enough in form alone, but it would be even worse when emitting smoke. The buttress-shaped tower appears weak in its upper story.

A very bad photograph of Mr. Street's tomb to Major Hodson, in Lichfield Cathedral, is exhibited by Mr. Earp. It neither does justice to the design nor to the execution of it.

The Chateau of Chambord, so frequently sketched, is still attractive to every one who can use a pencil. Mr. P'Anson shows a fine portion of it, but it is drawn in parts out of perspective. His tinted sketches of the Castle of Runkel, in Nassau, have the same merit of well-selected subjects which distinguishes that at Chambord.

The font to be executed in St. Matthew's Church, Bethnal-green, has well cut figures on its four sides, but the architecture to which they are attached is unworthy of them.

Mr. Hayward's chapel roof is a good specimen of the old hammer-beamed Perpendicular roof. The principals rest on columns and corbels; bands of decoration run between them and at the end, which would doubtless cost some money, and are of no value, being too weak in their lines and out of all character with the simple dignity of the roof.

We have already alluded to the tasteless design of Messrs. Green and De Ville for the Unitarian Chapel at Hampstead. In it the architects have evidently been forced into an uncongenial style. It seems really foreign to them. They give us about the same idea of Italian Gothic as a boarding school Miss affords us of the French language. Educated to portray the "bold Roman manner," their hands seem cramped, and they stumble at the work which other men, differently disciplined, perform with ease.

Mr. Lamb sends a very instructive series of designs. His first design for the City of London Consumption Hospital has those broad masses of wall-surface which architects are generally so chary of giving us. The main window is deeply recessed, and obtains value from the broad shadows which it is capable of holding. Very clever also in its arrangement is the east end of St. Andrew's Church, at Aldwerk, and the little porch which forms one of his studies for proposed churches in the frame numbered 39.

The photographs of the St. Patrick's Cemetery, Low Leyton, Essex, by Messrs. Wilson and Nicholl, show some brick buildings with stone dressings, vastly superior to anything which unlimited competition procures for Protestant cemeteries. Economy has evidently been insisted upon, but Messrs. Wilson and Nicholl's art shines brightly through it. In fact, as some plants grow best in poor soils, so we think these gentlemen are more successful in treating simple buildings than they are in the more costly work visible in their drawings of the high altars in the churches of St. Charles Borromeo, Upper Ogle-street, and of the Augustin Friars at Limerick (59), not but that the true Gothic spirit is seen in all alike. They are only inferior when compared with the same architects' work. The third sketch of altars has a heavy cumbersome support, which seems only necessary to support a pinnacle, which is a blot upon the design. In the cemetery the piercings of the stone for the lights are capitally managed.

Mr. Truett sends a sketch of the plainest of churches. It is evidently whitewashed, and has not a moulding or cusp upon it. It has no buttresses,

tower, turret, or other of the paraphernalia of the modern Gothic school, and yet we should be sorry to see it restored. It looks what it is—an unpretending village church, well suited for the countryfolk of Blakemere. It is, however, only a fraction of Mr. Truett's drawing, which consists chiefly of a huge poplar tree and a broad expanse of gaily-planted flower beds.

Mr. Manning's chapel, at Hampton, is well proportioned, and in good taste. It has rather too large a display of colours in the material. Mr. McI. North's design has been judiciously hung beside it as a foil to set it off.

The interior of Speen Church, near Newbury, is weak in design, as well as in representation. Pointed arches, round columns, an open roof, and chamfered bench ends, are therein put together in the ordinary stereotyped manner.

From similar threadbare features of church architecture Messrs. Francis have composed the closely resembling churches of St. Stephen's, Westbourne-park, and St. Mary's, Kilburn (57). Mr. Coe's St. Philip's Church, Kennington-road, exhibited by the colourist, Mr. Beetholme, and dozens of others which hang upon the walls, have the same family likeness. Passing the highly finished drawing of St. Asaph's Choir (62), we come upon a poor representation of St. Alban's Abbey, by Mr. Julian, and a fine drawing of a sculptured trefoil, by Mr. Edmonston. A couple of good subjects have been (in 68) inadequately treated by Mr. Baxter, and the back of Mr. Leonard's frame would have been as ornamental as the drawing in it.

"Imitation," it is said, is the homage which vice pays to virtue, and the saying receives confirmation in Mr. Phipps' design for a church, (73). He has boldly taken the one step from the sublime to the ridiculous. He fancies, apparently, that Mr. Street's talent lies solely in his rapid etching, and has, consequently, taken great pains to produce simply a coarse drawing. He has borrowed the lovely spire-lights from Mr. Street's church of St. Giles, Oxford, but they fail to enrich the design.

It is painful to see in Mr. Burnet's design for a family memorial (78) how money may be wasted. There are all the materials for a work of art, except only the knowledge of a master in employing them. We would prefer a mason's headstone to such a memorial as this represents.

Mr. Shoubridge's two oil paintings of views in Florence show only how the Committee have been obliged, in their disappointment in those invited, to go out into the highways and by-ways to compel folks to come in and partake of publicity. The drawing of St. Mary's, Greenock, by Mr. Goldie, is, we believe, one which we saw here two years ago. His studies for portions of the interior of Arundel Castle are likewise, we think, no strangers to us. They are, however, excellently designed in parts, and we are not sorry to have another opportunity of examining them.

Mr. Drayton Wyatt's lithograph of Mr. Scott's design for the proposed interior of King's College Chapel, makes us wish to see the enlarged drawing from which it was taken. It appears to be in that style which Mr. Scott has so successfully used at St. Michael's, Cornhill. The roof has semicircular ribs resting on columns and corbels, is open to the rafters, and has panels between them filled with coloured ornament. The walls are diapered, and coupled columns support the arches which divide the nave from the aisles.

Mr. Hayward's design for the Congregational church and schools at Plymouth, are not equal to that of his smaller works. The idea is good, especially of the schools, and a vein of original thought pervades it, but it wants a considerable amount of reconsideration and study.

136 is another design in which Mr. Street's spire-lights at St. Giles's have been introduced. One good point in this design is the avoidance of meaningless and useless buttresses.

Mr. Wimple's designs for cemetery chapel are designed upon a business-like principle to suit the limited intelligence of a local board. The money to be expended is divided equally between the two chapels, to secure the interest of the dissenters. Even a turret is given to the dissenters' chapel. It is a very good plan to work upon when the main object is to be successful in the competition.

173 was likewise submitted in competition for the Plymouth Congregational Church. With one-half the amount of work it might possibly look twice as well.

There are some good pictures in the dissenters' chapels of the Welford and Ipswich cemeteries, designed and carried out by Mr. Henry E. Cooper. Mr. Robins exhibits a photograph of the Croydon Cemetery chapels, of which we saw drawings some years ago. Mr. Seddon, although he exhibits no design, contributes two or three masterly sketches of some good stained glass. That from Rheims Cathedral is particularly fine. It is quite refreshing to see a Greek monument built now a days. Mr. Edward Richardson has designed one tastefully (208), and although it contains no great amount of originality, it has as much of that quality as three parts of the designs by the Gothic men, who will, as a matter of course, condemn it utterly. The Union Chapel at Highbury must have been a shocking eye-sore if it has been improved by the alteration exhibited in Messrs. Bedell and Lander's drawing (209).

Mr. Croft has put a new roof to the parish church of Shuckburgh (211), without destroying its character,—no trifling accomplishment in these days. It is one of the first parish churches which we have seen which has not been actually ruined by so-called restoration. The design of the pulpit at St. Matthew, Bethnal-green, is far more successful than that of the font which we have before mentioned (226). "The octagon stage of All Saints' Church tower, Kensington-park," is one of the best and most useful drawings in the Exhibition. It is drawn to a half-inch scale, and clearly

shows the design. A small sketch of the whole tower might advantageously have been appended to it.

Mr. James Fowler's "chancel of Wathe Church, Lincolnshire," is a very clever caricature of the recently built highly ornamented churches. The profusion of colour, tiles, stained glass, brick walls, and marble columns, are parodied very amusingly. The joke would, however, have been more forcible if the drawing had been better executed. The notion of showing the vaulting between the ribs left open to the blue sky is very quaint.

Mr. Joseph Clarke exhibits a fine interior of Point-de-Galle Church, Ceylon, with a novel and effective roof. Close beside it hangs the interior of Mr. Knightley's St. Matthew's, Bethnal-green. We should like to know why the hanging committee could not have hung the three drawings of this building together, instead of dispersing them promiscuously about the room.

Upon the screen there are some fine measured drawings; Mr. Willson's Lincoln Minster stalls, and Mr. Carzon's roof of the Geston Hall, Worcester, are particularly worth examination; and amongst the Class of Design sketches of the Architectural Association there are some very promising sketches by both Mr. Tarver and Mr. Adams.

MR. FRITH'S PICTURE.—THE RAILWAY STATION.*

THE scene of Mr. Frith's picture is the Paddington Railway Station, with its aisles, seen one from the other in many vistas and cross-views; a train drawn up to the departure platform; its engine evolving a faint smoke out of that deep throat of hasty breath, and a thirsty burning hiss blowing with a shrill breath of steam noisily from the whistle. On the top of the train are urgent porters taking up trunks by dozens, and drawing over them the tarpaulin covers. On the platform more urgent porters drive through assembled crowds with "By leave! by leave!" and do the best they can with mountains of luggage, sadly plagued by fussy ladies, whose sole earthly anxiety is for the inevitable straw-plait basket, containing the refreshments for the journey, of course, which, as their luck has it, they insist on having deposited in the guard's van. A Himalaya on wheels goes past the front in this predicament—a woman in rusty black exhorting a wondrously patient porter. In the background are volunteers, armed and hasty for drill. Hastens through the crowd a ruddy old gentleman, with a eased rod in his hand, a string of flies round his hat, bound for Shepperton or Maidenhead and a day's fishing. Next are hatted and feathered girls, their hair in nets of strange device, and bonneted older ladies rushing about with feminine impetuosity. News-boys bawl, and people hurrying, defiant of regulations and order, through imperturbable porters and guards, conscious of duty and office. There is a group of sailors bound for Bristol and the sea; a feeble father bound for a longer journey, guided through the crowd by his daughter, dutiful but rather hard, and somewhat heedless of the details of her office. At the side of the picture an old lady is seen who has been bent on smuggling a dog into the carriage with her, and defrauding the company of a fare for the same. She is apologetically angry to the porter who has found her out, and perhaps half-ashamed of herself; not so her daughter standing behind, a black-eyed impertinent girl in a hat, who seems to resent the man's civil remark to her mother, "I can't let him pass, m—m; it's contrary to orders." Next to these a keeper couples two setters, one of whom squats on his haunches looking at the man; the other, bright-eyed, stares away with erected ears, eager to recognise some coming master in the crowd. Next a showy, vulgar woman, in a red shawl flares along, dragging a little girl with one hand, while with the other she strives to arrange that inevitably disarranged bonnet of dirty white, that will come off her coarse ringlets and show her tawdry charms. The little girl, upon whose costume much fewer pains have been expended, trips along with a basket of food for the day. To the virago follows her meek husband, leading their male offspring, a boy prettily dressed in knickerbockers, and busily engaged with a caged bird he carries, may be to give it a little fresh air on the excursion the party evidently meditates—a kindly thought enough.

Next to these are the porter, pushing his truck, and the fussy woman. Keeping behind the main incidents, we come upon a stalwart sailor parting from his red-eyed wife, his hand kindly upon her shoulder while he caresses their child, it may be for the last time, and heedless, for the moment, of his comrades, who call him to their seats. Stooping out of a second-class carriage a brother kisses his sister in farewell: she is a bright blonde; while in the next compartment a daintily-dressed damsel mounts alone. A young naval officer, with his newly-made wife on his arm, rather impatiently awaits her parting from her mother, she tearfully bright the while. A recruiting-sergeant tosses up a bouncing boy a nurse has brought to say good-bye. This man is duly oiled and elaborately curled, and set out in shabby officer's coat. Near him two honest country fellows, recruits, who have been brought up to be attested, or just picked up about the London markets, examine their tickets and consult the incurious under-guard about the why and the wherefore. These are clean-limbed and healthy-looking men, who have taken her Majesty's shilling and mean to earn it. Not so the ugly gallows-bird who has likewise enlisted—wasted town sot, who, not repentant of his debauch, sucks in his feverish, cracked lips a favourite stick, and raps his yellow teeth with it, staring out of his hateful bleared eyes, while the white-haired mother, her face hidden in a widow's cap, leans her forehead upon his shoulder and sobs, as she shall sob alone.

Immediately in the centre of the composition stands a bilious Frenchman, yellow from gorging those hot breakfasts of his, and the interminable cigars that follow them; he is fur-clad, bearded like a seedy "pard," ringed on the finger, holding an open porte-monnaie, listening incredulously but weakly to the dogged lying of the genuine London cabman, who has followed him into the station for double his fare. He has bouncing charms across his waistcoat, a courier's bag at his hip, and upon his head the hideous hat the lower breeds of his countrymen have assumed of late. Lean and fair, his eager, angry wife, a miracle of gloves and ribbons, angrily remonstrates and would resist the extortioner. She confronts, with the fussy spirit of a hen, the blank impudence of the cabman, who, stolidly holding a florin in his palm, avers that between Leicester-square and Paddington are more than tea cab miles.

Just about to enter the carriage comes the prettiest group of all, placed pain-

fully in contrast with that we shall next describe. The first is the departure of a young bride with her new husband. He is a blond-whiskered young Englishman, daintily dressed, who turns from the lady upon his arm to answer the query of the smart groom beside him touching the disposal of a lady's new dressing-case held up for view. Two fair bridesmaids, evidently sisters of the bride herself, tearfully take leave. They are yet in full dress—a pardonable oversight on the painter's part, who might be thankful to employ his softness, brilliancy, and dexterity of touch upon fabrics such as would light up his picture. The painting of these robes is admirable in all that clever dash which Mr. Frith is unrivalled for. The bride has eyes like a dove; her robe is dove-hued, of faintest tints. In front of the new couple sobs the lady's youngest sister, a child, to whom a gallant little boy in green velvet tenders consolation with infantile gravity, much to their nurse's amusement, who stoops to the crying girl for the same purpose. The sparkling prettiness of all this group recalls some of the most fortunate portions of the artist's "Ramsgate Sands."

Just in front of these is a shocking incident, told with characteristic force and expression—the arrest, just as he got into the carriage, of a forger, by two London detectives: portraits of men famous in their way are these before us. Pale bronze green is the face of the man when the mufflers drop from his chin, paralysed the hand that lets fall the bag with a crash upon the floor, ghastly the face of his wife, who has risen from her seat to see the felon taken from before her. The incident is too painful, too unusual to be characteristic, but it is well told. Let us turn from this to the departure of two boys for school after their holiday. This is right in front, and almost in the centre of the composition. Mr. Frith has never painted a shawl or other texture with more splendid dexterity and skill than that which the full-blooming mother wears who stoops over the younger boy and kisses him, drawing him towards her. The dainty crispness of all her apparel is inimitable, from the pure white bonnet to the lustrous silk of her brown gown. Her face is motherly and graciously full-blown, excellently expressive. Not less so is the boy's action, who, conscious of a new cricket-bat, can but embrace his mother with one hand that is disengaged. The remainder of this group comprises the father, the sister, little stay-at-home brother, and the elder scholar. The last is a capital point; he is a valiant but soft-hearted youngster, who, having made up his mind to go through the parting like a man, does his best, but it will not do—these swollen lips and red-edged eyes tell of a night of tears. In his waistcoat pocket is a new watch, as the stiff-jointed chain tells us that hangs through the button-hole. More sensible, because older than his brother, he forgets even this at the moment, and would, if he dared, sob heartily; what strengthens him most, and, perhaps, at the same time, shames him most, is the cleverly-introduced point Mr. Frith has given us of the hand of the father being affectionately pressed on his shoulder.

We think Mr. Frith has found his greatest enemies in the Directors of the Railway Company, who, having removed Mr. Owen Jones's decorative colour from the roof and columns of the station that form the background of the picture, have compelled him to introduce an enormous mass of grey, such as all the resources of his individual skill have failed to overcome. To counteract this, he has been compelled to localise more than in another case he would have done. It may be that he did not care to employ sunlight in this picture, as in the "Derby Day" and "Ramsgate Sands," otherwise much of this misfortune would have been overcome by that effect being introduced. As it is, taking the picture for what it is—an effective representation of the incidents of a striking and peculiar scene of modern life—it is undoubtedly a noble and dramatic work. What the dexterity, cleverness, brightness, and lightness of touch—no trivial accomplishments, let us assert, nor gained without infinite labour with happy ability—Mr. Frith possesses can do, we need not say. All that little points of humour and comic hints can give of interest to a picture are here. All the sparkle of modern life, all the lustre of modern dresses, all the character of modern faces; everything that can interest, and remind and amuse, are here, with grim pathos of modern crime, stark-naked, in the midst of them.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE next ordinary general meeting of the session will be held on Monday evening, the 28th inst. Her Majesty having been graciously pleased to approve of the presentation of the gold medal to the Rev. R. Willis, Jacksonian Professor, Cambridge; the royal medal, the silver medal of the Institute, and the other prizes awarded at the special general meeting, will be presented by the President at this meeting.

The following paper will likewise be delivered, "On Jewish and Roman Architecture in Palestine, from the earliest period to the time of the Crusades," by Signor Pierotti, architect to the Pasha of Jerusalem.

The following are the amended instructions for the Soane Medallion:—That the Soane Medallion be awarded for the best design, well illustrated by a sufficient number of drawings, for:—A church, to contain 1,500 persons, without any detached columns or piers, and so as to leave the view clear and unobstructed throughout. The style may be either Italian or Mediaeval. The drawings to consist of plans, sections, and elevations, drawn to the scale of $\frac{1}{8}$ of an inch to the foot. The plans and sections to be tinted in sepia only, and the elevations to be in line only. Perspective drawings may also be sent, and they may be tinted or hatched. The successful competitor, if he go abroad within three years after receiving the medallion, will be entitled to the sum of £50 at the end of one year's absence, on sending satisfactory evidence of his progress and his studies. The competition for the Soane Medallion is open to all members of the profession under the age of thirty years.

Messrs. T. Hayter Lewis and James Bell, hon. secretaries of the Institute, have issued a circular, in which they state:—

We beg to inform you that we do not propose to offer ourselves for re-election as honorary secretaries at the ensuing annual meeting of the Institute. Since our election we have done our best to fulfil the duties of the office, and have, in the execution of them, met with so much kindness, and have been enabled to form so many, and, we trust, lasting friendships amongst our brethren in the Institute, that we shall always regard the few years which we have passed here as honorary secretaries with the most agreeable remembrance, nor should we have resigned, so long as we possessed the confidence of the members, if we could have continued to afford the time required to fulfil adequately the duties of the office. This, however, we are unable longer to do, and we can, therefore, only tender to you our resignation, accompanied by our sincere thanks for your uniform kindness, and with our best wishes for the continued prosperity of the Institute.

We are, dear Sir, yours very faithfully,

T. HAYTER LEWIS.
JAMES BELL.

* From the *Athenaeum*.

THE BRITISH MUSEUM.

THE decision of the Government on the subject of providing additional accommodation for the collections of the British Museum is now definitely announced, by the publication of the correspondence which has passed between the Lords of the Treasury and the Trustees.

The Trustees, at intervals within the period of a year, urged the question on the Government, and finally called their attention strongly to the fact that, from sundry recent accessions to the Department of Antiquities, the want of space had become so intolerable as to demand an immediate and effectual remedy. The reply was conveyed in a lengthy Treasury minute, dated 13th November, 1861, in which it was announced that, as the Government alone had to bear the responsibility of making a proposal to Parliament, they considered it to be their duty to review the entire subject, and, while weighing conflicting opinions, to arrive at a practical conclusion.

Although the Bloomsbury site had excellently served its purpose, yet, considering the growth of a city continually stretching outwards, substantial reasons might be found for separating the collections, for which, however, it was important to choose a spot easily accessible. If the internal communications of London were to remain fixed, a site so accessible as Bloomsbury to the mass of the population could hardly be suggested; but, as these communications are felt to be imperfect, and must be increased, other spots on leading lines of thoroughfare might become in process of time even more accessible—except to those living in the immediate neighbourhood—than that on which the Museum now stands.

The cost of a site on the estate of the Royal Commission of 1851 would be less, by some hundreds of thousands of pounds, than at Bloomsbury; and, moreover, if the Natural History Collections were removed, a fabric of a much cheaper description than the British Museum might and should be erected for their accommodation. The saving to be effected at Kensington, under the two heads of site and buildings, would thus be very great.

My Lords conclude by stating that, in their judgment, some of the collections ought to be removed; and that they will be prepared to make proposals to the Royal Commissioners for the provision on their estate of space sufficient to receive, at first, the Mineralogical, Geological, and Palæontological Collections; and ultimately, if thought desirable, for the remainder of the Natural History Department.

At a special general meeting of the Trustees, held on the 3rd December, and attended by nine members of the Government, it was resolved to appoint a Committee to consider the mode in which the proposals of the Treasury minute could be best carried into effect. This Committee consisted of five Trustees—the Speaker, the Duke of Somerset, Mr. Walpole, Mr. Towneley, and Mr. Grote. They held some meetings; and in January, after having conferred with Mr. Smirke and the heads of departments, they adopted, with slight verbal alterations, a report which had been prepared at their desire by Mr. Panizzi. The report was privately printed and sent to each Trustee, with a notice requesting his attendance on the 10th February at a special general meeting, at which it was to be taken into consideration. It was then received, and its suggestions adopted.

The Committee recommend in their report that all the objects of natural history should be speedily and simultaneously removed. The Botanical Collection may, perhaps, be moved to Kew-gardens, if a small series be reserved to illustrate fossil botany in connection with palæontology. The Ethnological Collection should be provided for elsewhere, and the portraits may be moved to the National Portrait Gallery.

The accommodation gained by the removal of these collections would amount to 63,719 square feet.

Although the Antiquities and Library Departments have the chief claims to the redistribution of the vacated space, the Committee think that other divisions of the Museum have also claims on their consideration. The buildings now used for the administrative part are deficient in space for clerks, and stationery, and papers of all kinds, and for the transaction of business, besides being subject to inconvenience from the unsuitable arrangement of rooms. Next, it is absolutely necessary to provide for the exhibition of coins and medals, and a selection of gems, cameos, and valuable ornaments. In the Department of Prints and Drawings space is required for classifying and arranging the whole collection, and for exhibiting such selected works as may convey a general idea of the progressive practice of both arts. Rooms for studies are wanted, too, in this department. The Committee have also to consider the confined space for binding books, and they suggest that adequate provision should be made for having all books bound within the Museum premises—an arrangement which had been allowed to be temporarily infringed upon.

The structural alterations, which are proposed to be effected, are, of course, subject to such modifications as may hereafter be determined. They are mainly comprised in the following suggestions.

Right and left within the readers' entrance of the corridor leading to the reading-room are to be new staircases. The present staircase on the left of the entrance-hall is to be removed. With the area thus gained, and by taking down the wall which divides the staircase from the Roman Gallery and substituting columns, a room, 94 feet by 60 feet, will be obtained for antiquities. The removal of sundry partition walls, and the appropriation of pieces of unoccupied ground to the west, will allow additions to be made to the Egyptian Gallery, the Græco-Roman Saloon, and the Elgin rooms.

On the upper floor, the rooms now occupied by Geology, Mineralogy and Palæontology will be transferred to the antiquities, which already occupy the west side. Such is the solidity of the building that all the

galleries on this floor might be used for the exhibition of sculptures, even of large size.

When the new library and reading-room were erected, it was believed that there would be space for 800,000 volumes, calculating the annual increase for 40 years at 20,000. But the annual increase has now reached 35,000 volumes; and, although the new building will contain more books than it was originally estimated to hold, yet, if the present rate of increase continue, it will be full in about 25 years. Alterations are indicated which would provide additional space for 200,000 volumes. Details are given of the proposed accommodation for the binder, for the Trustees' offices, and for the several collections of prints and coins. Into these it is needless to enter more particularly.

The proposed additions to the departments retained in the Museum are shown in the following list:—

	Present space.	Proposed addition.
Printed books	117,746	17,803
Manuscripts	13,178	3,430
Antiquities	91,784	67,692
Coins and Medals	2,950	4,960
Prints and Drawings	2,690	5,554
Collections, &c.	6,724	3,626
Binders	4,539	3,221

The Committee urge that the erection of buildings on unoccupied ground at the Museum should be proceeded with at once, and also that no time should be lost in providing buildings for the reception of the Natural History Collections; because, until this be done, no redistribution of the vacated space can possibly be undertaken.

The Chancellor of the Exchequer has announced his intention of introducing a Bill into Parliament for the purpose of legalising the separation of the collections at the British Museum on the plan proposed, and for maintaining the control of the Trustees over the several collections.

The site designated by the Royal Commission is understood to be that temporarily occupied by the western annexe to the International Exhibition, and forming the east side of Prince Albert's-road. As the Government wish to have eight acres of land, a portion of about two acres with a frontage to Kensington-road will, probably, be added in order to obtain the required extent.

FIVE SHILLING DAYS AT THE EXHIBITION OF 1851.

SOME one has said, with more smartness than truth, that "nothing is so fallacious as facts, except figures." A saw of this kind, having with it a certain epigrammatic ring, passes current, and is handed about by those even who are aware of the great value of statistics. At all events, it may be safely averred that there is one thing more delusive and less to be relied upon than either facts, or figures, and that is popular impression. Many supposed "facts" rest on no sounder basis than general belief, and will not stand the test of those "figures" which are described as so deceptive.

Some complaint has been made about the number of days immediately succeeding the opening of the International Exhibition that are set apart for those only who pay five shillings on entrance. Now, what the Commissioners have to regard is the eventual profit of the Exhibition, and, to insure that, they should arrange the scale of charges for admission so as, if possible, to prevent the guarantors from being called upon to make up any deficiency. In this view, therefore, they are clearly free to act on their own judgment, and are quite justified in having an eye to the interests of all classes; and, moreover, they have an incontestible right to fix the admission fee at whatever sum they please. Granted that a high charge thins the attendance, that is the very end in view—to let people walk about comfortably and easily, without the insufferable, stifling sensation produced by mobs, whether of well-dressed or ill-dressed persons. Which of us is not familiar with the heat, the dust, and the weariness inseparable from any general gathering? After all, is five shillings too high a price to pay for peace and comfort?

The almighty shilling is always ready to rise up and inveigh against high charges, not in the least with any idea of cheapness, but upon "principle;" not, of course, thinking of self, but thoroughly single-minded, and anxious to place the honest, hard-working man—ever and always him—on a footing with the highest in the land. If the objectors could not hereafter enjoy abundant opportunities of making as many visits as they choose "at their own prices," there might be some cause for grumbling. But, it will be urged, it is the shillings that pay—it is the money of the many, and not that of the few, which makes the success of any show, or entertainment. Most persons, if asked their impression as to the receipts of the former Exhibition, would unhesitatingly say that the crowds which entered on the shilling days were so enormous as to forbid the hope of any comparison with the early days of high prices. Nevertheless, it happens that, on a careful examination of the amount received each day at the different prices—whether at the 5s. charge during the first three weeks, or at the subsequently reduced rates—there is a most remarkable agreement between the sums taken. The Exhibition of 1851 was open to the public on 140 days (exclusive of the 1st of May, when no payment was made at the doors), and the total receipts were £356,808 1s.; so that the average for the whole period was £2,548 per day, while the average of the first three weeks, at the charge of 5s., was £2,546.

On the 1st of May season ticket holders only were admitted; on the 2nd and 3rd, the payment for admission was a pound. From the 5th to the 24th (inclusive), the charge was 5s. Friday and Saturday then became, respectively, 2s. 6d. and 5s. days, ending with Saturday, August 2nd; and

thenceforward, till the close of the Exhibition on October 11th,* the charge, on Fridays and Saturdays, was 2s. 6d.

While on this subject, it may be interesting to mention that from the gross receipts a sum of £529 17s. 5d. had to be deducted for losses on light gold, and defaced, spurious and foreign coin. Of counterfeit English money there were 12 crowns, 260 half-crowns, 1,034 shillings, 90 sixpences, and 3 fourpences, making altogether the amount of £90 5s. These returns seem to disprove the notion that, from their greater value, half-crowns and crowns are most commonly imitated. As no change was given at the doors, it follows that there were 272 utterings of the larger pieces, as opposed to 1,080 at the lowest, or 1,127 at the highest computation of the smaller coins.

The total number of visitors was 6,039,135. In the refreshment department the various classes spent on an average about threepence per head; those at 5s. laying out 44d.; those at 2s. 6d., 48d.; and those at 1s. 24d. per head.

The season tickets were, for gentlemen, three guineas; for ladies, two guineas; and the total number sold was 25,605, of which 13,494 were gentlemen's, and 12,111 ladies' tickets; the net amount received being £67,514 1s. Of this sum, £386 10s. was received from the sale of 135 gentlemen's and 184 ladies' tickets, at the reduced rates of 30s. and 20s. respectively.

ARCHÆOLOGICAL INSTITUTE.

AT the meeting of the Archæological Institute, April 4, OCTAVIUS MORGAN, Esq., M.P., V.P., in the chair, Mr. WATERTON read a paper "On the Art of Niello," preliminary to the proposed exhibition by the Institute, in June, of a series of specimens, combined with examples of enamel, so as to show the progress of the two mediæval arts of decoration, which contributed largely to the enrichment of ancient jewellery and metal work. He described the process employed and the nature of the metallic compound of silver with other metals, sulphur and borax, termed *niello*, and traced its use by the Etruscans and Romans, noticing examples in the Kircherian Museum and the Vatican, of which the date has been assigned to B.C. 600. After the Christian era the specimens are comparatively frequent, and several fine works existing at Rome were noticed, as also one in Mr. Waterton's own collection—this is a ring of the seventh century. He proceeded to trace the art among the Anglo-Saxons, who were celebrated throughout Europe for skill in goldsmithy; and he instanced the gold ring in the British Museum, bearing the name of Ethelwulf, father of Alfred, in *niello*. This curious art, chiefly employed on silver ornaments, was practised also in Ireland, and fine specimens exist in the Museum of the Royal Irish Academy, also on the Cross of Cong, wrought about 1185. *Niello* is found also on the Scottish brooches, of which the Duke of Hamilton and the Marquis of Breadalbane had exhibited examples at previous meetings of the Institute. The art was doubtless introduced from Italy, and Theophilus, in his valuable treatise on Ancient Arts, states that the Tuscans excelled in its use. Mr. Waterton described a few of the most beautiful specimens of later times, such as church ornaments, well illustrated by Ciesgnara and other writers. *Niello*, he remarked, has a peculiar interest, as having led to the art of caligraphy and the transfer of engraved designs to paper, through the precious discovery by Maso Finiguerra. *Niello* was much used by Cellini and the later Italian artists in metal, and has lingered amongst the Russians, by whom numerous works thus enriched are produced to the present time; but they are deficient in delicacy of design, and the artistic effect displayed in mediæval examples.

Mr. BURTT, Assistant-Keeper of Public Records, then read some notices of the "Early Use of Gunpowder in the English Army," which he had found in the Pipe Rolls of the Exchequer, relating to the campaign of Edward III., in 1346, in which the Battle of Cressy was fought.

Sir FREDERIC MADDEN then gave a discourse on a charter of Edward the Confessor to the Monks of Westminster, dated 1066, with his seal enclosed in a bag of beautiful tissue. This document was sent for the inspection of the Institute by the Earl of Winchelsea. It was printed by Dugdale in the *Monasticon*, having been found by him in the Hatton Library, at Eastwell, in 1640, and since that time it had never been submitted to critical examination until the present time. Its authenticity, Sir Frederic observed, had long been questioned; many charters exist of early periods, fabricated in some cases, probably to supply the loss of genuine instruments; examples occur among those relating to Croyland, Peterborough, Worcester, &c., but the monks of Westminster seem to have been most skilled in such imitations. Sir Frederic stated that, of all monastic documents prior to the time of Henry I., none was free from suspicion.

Mr. FERGUSON gave an account of a recent discovery in Carlisle of a curious Roman sculpture, representing, as Mr. Franks suggested, a soldier of one of the legionary cohorts quartered on the line of the Roman wall.

Mr. LYOCK communicated a memoir on ancient gardens, illustrated by plans of the gardens at Blois and other places, and by a piece of French tapestry, date about 1550, in which numerous representations of garden decorations are displayed.

Amongst objects exhibited were a fine series of Papal medals, from the sixteenth century, by Professor Westmacott; Italian gold rings, by Mr. Waterton; a document with a unique impression of the seal of the Captain of the Isle of Wight, by Mr. Hewett; and a silver watch, presented by Charles II. to Captain Tattersell, by whom he was conveyed to France after the disastrous battle of Worcester in 1651. This watch, made by the celebrated Hooke, was brought for inspection by Mr. Rhodes.

THE FRENCH ARCHIVES.—An extensive addition has just been made to the Palace of the Archives of the Empire, by the completion of a large fire-proof building at the corner of the Rue des Quatre-Fils and the Rue du Chaume, Paris. The walls are all two metres thick, and the floors of iron. The general archives of the Empire comprise several millions of documents, contained in 300,000 boxes, bundles, and registers.

* The building was opened, without charge, to exhibitors and their friends only, on 13th, 14th, and 15th October.

THE STREET ARCHITECTURE OF LONDON.—MR. EDMESTON'S LECTURE.

IN our last we gave a report of the lecture delivered by Mr. JAMES EDMESTON before the Society for the Encouragement of the Fine Arts, at 9, Conduit-street, Regent-street, on Thursday se'night.

The chair was occupied by Mr. E. B. LAMB, who, in introducing the lecturer to the meeting, remarked that the subject of street architecture was one of great importance, and that he was afraid it had been much too lightly treated in this metropolis.

The lecture having been read, the CHAIRMAN said he had no doubt some gentlemen present would have something to say on the very interesting subject of Mr. Edmeston's very able paper. The paper contained many points of deep interest, but it was almost impossible to go into the whole of them. The antiquity of London and the different names now given to old places was a point of importance. We were very apt to lose sight of the old things by the new position and the new garments they were placed in. As to Crosby Hall and other buildings referred to by the lecturer, they were possessed of immense interest, looking at the position they held in the history of England. As to Crosby Hall, lovers of antiquity knew the building and admired it, but they saw from time to time beautiful fragments of carving in wood and stone placed under the most barbarous demolition that could possibly happen. He knew that more than twenty years ago a great portion of the old building was taken down and sold. After a time it changed from being a packer's place to a music hall. Now it seemed there had been another change, which did not improve the building. In the change one regretted to see a building of so much interest so completely forgotten, and left to destruction as it was. Mr. Edmeston had alluded to the changes that necessarily took place in all countries in art arising from various circumstances. They knew very well that the architecture of 300 years ago would not do for the architecture of the present day. As man improved in his wants and manufactures, and so on, architecture must also improve; and it had done so. One of the great errors of the present day was to put improved wants and manufactures into old garbs and antiquated forms. That was not what they ought to do at the present day; they ought to advance the noble art of architecture with the art manufactures of the day. He remembered some few years ago a society established, which would never admit that there was an architect in existence who could design a church or a building, and themselves usurped the power of doing everything. Many men had been cramped by the opinions of people, and thus architecture had been kept in trammels. Mr. Edmeston had alluded to the sky-line, to uniformity of line, and various other subjects of that nature, which led to a very difficult and troublesome matter. First, architects had to deal with that obstinate and stubborn animal John Bull, who, possessed of his square yards, said "This is my property, from the ground to the sky, and I will do as I like with it; if I can build my six or ten stories high, and can get rental for them on my bit of land, it will be better than all your architecture, and it will also pay me better." As Mr. Edmeston had remarked, cornices might be made useful by greater attention being paid to their arrangement. Then there was another difficulty which architects had to contend with, and that was an Act of Parliament. Unfortunately, Acts of Parliament were not made by architects, and so they could not expect artist-matters to be well considered. Attention to the sky-line was recently coming more into fashion, and when followed with ability and carefulness it was likely to produce most interesting architectural effects in London. But it might be that instead of care being taken that a particular sky-line should harmonise with some other sky-line and produce a fine effect, the sight might be destroyed by the introduction of incongruities. He trusted, however, that in the course of a little time, through education on the part of the public in the art of architecture, such defects would be got rid of. There was no doubt that in respect of education in architecture, there was much to be got over; not much difficulty, but much prejudice. It was no novelty that architecture was looked upon as a mere dry line-and-rule science, and that it was nothing but Euclid put in a different form. That was the opinion of the general public as to what architecture was. Now, the principles of architecture were as simple as possible, and as easy of acquisition as the broad principles of painting. He liked to hear a man not connected with art say that he liked this or that painting, or this or that building, but why he liked it he could not tell. Still, that he did like the painting or building was a great point, and a little education would teach that man why he should be pleased with the building or painting. They ought to inculcate simple principles as much as possible. The great aim of the architect was to make a building so as to impress the mind that it was a beautiful object; and what could be beautiful that was not harmonious? He thought that the lecture delivered by Mr. Edmeston that evening would be exceedingly useful in the education of the general public. As to street architecture and its incongruities, they found Gothic houses next to Greek houses, but such things could not be got over without teaching the people, and it was for architects to do so as much as possible. It was to be hoped the public would not look on architecture as a dry art, but as one that was very simple, and the general principles of which were very easily acquired.

Mr. HURLSTONE referred to the sky-line of buildings, and to one of the greatest deformities in the street architecture of London. If a person went to the south side of Belgrave-square and looked towards the east side, he would see a range of buildings having some architectural pretensions, but when he looked at the sky-line he would find a medley of chimneys in all forms, which made the whole thing perfectly ridiculous. Then if a person went down looking towards Wilton-street he would find a uniformity in the buildings, but there was no sky-line, and a forest of chimneys presented itself in all directions. It might be said that chimneys at the top of a house were in some degree a sort of untameable objects which could not be managed, but then they should remember that there was a beauty added to Venice by the chimneys, and that the last thing a person would wish would be to see them away, for they made a most beautiful ornament in many of the ancient cities, as at Nuremberg. A chimney was not an unsightly thing if properly treated. In alluding to architecture as an art, the lecturer seemed to imply that beauty in the decoration of a city was a thing separate from usefulness and conveniences. Now he (Mr. Hurlstone) said fitness, propriety and convenience were often the very elements of beauty, and that beauty sprung out of them. One reason for the ugliness of London was that it had not been built freely on the ground of fitness, propriety and convenience of the circumstances. One circumstance had tended to injure the street architecture of London generally. There existed, years ago, and it continued for many

years in operation, a window tax, and builders so erected houses as to economise light and air as much as possible, in order to evade the tax. That was an element which no doubt influenced the street architecture of London a considerable time, and it interfered with convenience and fitness. It was impossible for architects or builders at that time to adopt the spacious windows of the Flemish or Venetian schools, for the windows had to be built as much as possible to evade the tax.

Mr. STEWART quite agreed with the last speaker as to the impolicy and inutility of the window tax. As to the paper read by Mr. Edmeston, he was very much interested in it, and very much instructed by it; the spirit in which it was written was an instructive spirit as well as a good one—(Hear, hear). Mr. Edmeston said something in his lecture about the advantages of having high streets. Now he thought that was a subject about which there might be two opinions. In southern climates high streets were very essential as a protection from the sun, and in Italian cities they were used for that purpose. But he was not so sure of the utility of high streets in a humid climate like ours. Some streets, where the houses were high, as at Edinburgh, were never touched by the sun. As to the picturesqueness which Mr. Edmeston spoke of, he was not sure that the picturesque in treatment was the highest style of treatment; on the contrary he was inclined to think it was a lower style of treatment than the classical. He had no doubt they all knew Turner's print of ancient Italy, and he was certain that the outlines of that print presented a far higher and more dignified style of treatment—and it was all classic—than any of Prout's best productions. By comparing the picturesqueness of Prout with the classicality of Turner, he had come to the conclusion that the classical was a far higher style of beauty than the mere picturesque, as shown in the print he had referred to. Architects were not to be blamed, said Mr. Edmeston, if it was found that in some portions of buildings they exhibited well-considered plans, while in other portions there were plans which were not well considered, the blame being attributable to the clients. Now he did not agree with that. He thought they were in a transition state on that subject, and architects, artists and decorators had to contend with this, that their own minds were not fully developed, and even though they had the intellectual power, the reasons for arriving at conclusions were not always within their grasp. They were becoming more and more educated, but an architect might show an amount of education in one portion of a building, while he showed a want of education in another portion. That should not be laid to the ignorance or caprice of the client. As to the reference which had been made to the works of the French, he thought they could find a far higher style than the French—he meant the Italian—which, though not very popular at present, contained far higher principles, and, when fairly developed, was a far more vigorous and more noble art than that in France.

Mr. DUTTON said he could endorse a great deal which Mr. Stewart had said. In France they were altering their style of architecture; they used to have high houses, but now they were lowering them and widening their streets. He had noticed that many houses might have been more beautiful if they had been originally constructed well. There were two great defects in architecture—bad ventilation and smoky chimneys. Now the client could have nothing to do with such defects, the fault must lie with the architect or the builder. He then expressed his regret that the vacant space around St. Paul's had been again built upon, instead of being left open so that the beauties of the metropolitan cathedral might be seen to greater advantage.

Mr. EDMESTON said, in throwing his few remarks together, it occurred to him that it was much better to avoid, as much as possible, detail, and to inculcate very general ideas, for the purpose of exciting an interesting discussion, which he was glad to find had been the result. Everybody could judge as he walked along the streets of what was good in its outline, and whether a building was good in its general parts. And if the public at large could be taught to acquire the habit of looking at main features in that way, we should make a great step in advance—(Hear, hear). Only let the public at large know how to point out defects, and then such defects as imperfect ventilation and smoky chimneys would become scarce and gradually disappear. Mr. Hurlstone justly alluded to the evil effect of legal regulations on buildings; now he (Mr. Edmeston) thought they might have legal regulations for the benefit of buildings. In alluding to the picturesque, Mr. Stewart seemed to be under the impression that he referred altogether to Gothic. Now, such was not the case. He thought that the view of St. Paul's from Ludgate-hill was most picturesque, or, if they liked, poetical—(Hear). He was of opinion that the pall of London smoke had much to do with some of the architectural difficulties which had been complained of.

The CHAIRMAN thought that much inconvenience and annoyance were caused by the erection of "tall boys," or "horses' legs," which led to chimneys becoming smoky. As to gas, if we could get pure gas we should have no smoky walls, but the gas companies could not afford to give us pure gas for the prices charged. In Venice they could afford to do without "tall boys" and with very few fires.

Mr. ATKINSON had had some experience in curing smoky chimneys, and was of opinion that the construction of the grate had something to do with it. Many of the present stoves threw the heat into the room instead of throwing it into the opening of the chimney, which would always lead to the smoke going up the chimney. He thought that the prevalent street cobwebs (telegraphic poles and wires) had a very detrimental effect on the picturesqueness of street architecture in London.

The CHAIRMAN remarked that it was a very easy thing to find fault, but it was not so easy a thing to mend a fault—(Hear.) Criticism upon architecture at the present time was a blank; there was scarcely one man who criticised in the public journals who really understood anything like the broad principles of architecture.

On the motion of Mr. DUTTON, a vote of thanks was tendered to Mr. Edmeston for his very able paper, and the meeting broke up.

SPRING GARDENS.—Lord Kingsdown asked the head of the Admiralty whether the Board of Admiralty intended to persevere in its intention of purchasing the houses in Spring-gardens? He asked this in consequence of a notice which had been served on all occupiers of houses there that the Government would bring in a bill to purchase these houses. In reply, the Duke of Somerset said that the Admiralty were desirous to bring into immediate contiguity to the Admiralty all the Admiralty departments. To do this the houses in Spring-gardens would have been necessary, and the Board of Works were required to serve notices on their occupiers. In consequence, however, of a desire on the part of the Board of Works and the Treasury to reconsider the plans prepared on the subject, no further progress would be made this session.

PLAN AND DETAILS OF MACHINERY SHED OF THE EXHIBITION BUILDING.

WE in our last volume engraved a view of the exterior and interior of the building for the International Exhibition—soon to be the one point of attraction to foreigners from all parts of the world, as well as to every Englishman. We now engrave a plan (pp. 270-71) from the official drawings, which will serve as a guide in that wilderness of iron columns and piled-up treasures. The plan will be readily understood by our readers. They will see at a glance the nave and the two transepts—the main features of the plan—over the junctions of which the colossal domes are built. The large courts to the south of the nave, 250 feet by 200 feet, are likewise conspicuous, as well as the rather smaller ones to the north of it. The columns are in general 25 or 50 feet from centre to centre. By bearing this fact in mind, the various dimensions can easily be arrived at without making use of the scale. The exceptions to this rule are the nave and transepts, which are 85 feet wide. The columns are hollow, and of cast-iron, 1 foot in diameter, with 1 inch of metal. They rest on York slabs, brickwork and concrete, all built up to the same level.

The walls which form the picture galleries, and enclose the main portion of the building, are all of brick. The east and west fronts are 750 feet long, and the south front 1,150 feet. The north front is the lower arcade of the Horticultural Society's grounds—an upper story to which has been added for grand refreshment-rooms. The total area roofed in is 988,000 square feet; the 1851 building occupied only 799,000 square feet.

We also engrave a sheet of details, which really contains the whole of the drawings for the annexes. It is, as everybody seems to admit, the most satisfactory portion of the building in point of design; simple and light in its construction, it forms a very cheap, as well as agreeable, system of roofing. Captain Fowke has used it on several other occasions, and always with a pleasing result. Only the commencement of the annexes could be shown on our plan, but they extend northwards between 900 and 1,000 feet on each side—a tunnel under the Horticultural Society's entrance connecting the eastern one with the main building. The ribs are 50 feet wide, and 15 feet apart. They are formed of planks nailed together. The centre plank is 1½ inch thick, with a ¾-inch plank on either side nailed to it, the ends breaking joint all through; the ribs are nearly half of a regular polygon, described about a semicircle. The springing is 10 feet above the ground line. The uprights are similarly constructed to the ribs, but there are strengthening pieces 4 feet by 3 feet spiked to them on either side. The feet of the uprights are mortised into a sleeper resting on piles. The principal rafters and the uprights are connected with the curved ribs by radial pieces of 1½-inch plank, which are brought rather below the intrados of the curve, and finished off by way of ornament by spear heads. The frames are, therefore, simply planks nailed ingeniously, and so disposed that the weight comes on their edge. One-half of the roof is covered with boards and felt, and the other half has a glazed skylight, with louvres for ventilation throughout the whole length. The span of each rib is 50 feet. In ingenuity, economy, and simplicity these sheds are, as Captain Phillpotts truly said, a triumph of construction.

APPROACHES TO THE CRYSTAL PALACE.

A DECISION was arrived at on Tuesday last by the Committee of the House of Commons sitting on the Railway Bills of Group 1, which is likely to exercise a most beneficial effect on the future prospects of the Crystal Palace. The Chatham and Dover Railway Company have this session promoted a line starting from the junction of their Metropolitan and Victoria lines at Brixton, and proceeding through Peckham, Forest Hill, and Sydenham, up to the road front of the Crystal Palace; and the Committee declared that, subject to the Brighton Company constructing a portion of the line, over which the other company is to have ample running powers, the bill should pass. This important measure will give access to the Palace on a sufficiently high level to avoid the inconvenience caused by the present numerous stairs; and as the new station, which is intended to be placed in Dulwich Wood, immediately opposite the Palace, will have platforms of nearly 1,000 feet in length, with several wide covered lateral approaches to the level of the lower floor of the building, it is obvious that great public convenience will result from the forming of this additional means of access to the Palace. As this new line will also open up the Metropolitan (Underground) Railway by the intended bridge at Blackfriars, the northern railways, the Metropolitan stations in Farringdon-street and the New-road, will thus be in direct communication with the Palace. The chain of communication with the North London Railway by Kensington and Wandsworth is also fast approaching completion, and thus it may be hoped that, ere long, the great desideratum of ready and convenient railway access to the Crystal Palace will be attained.

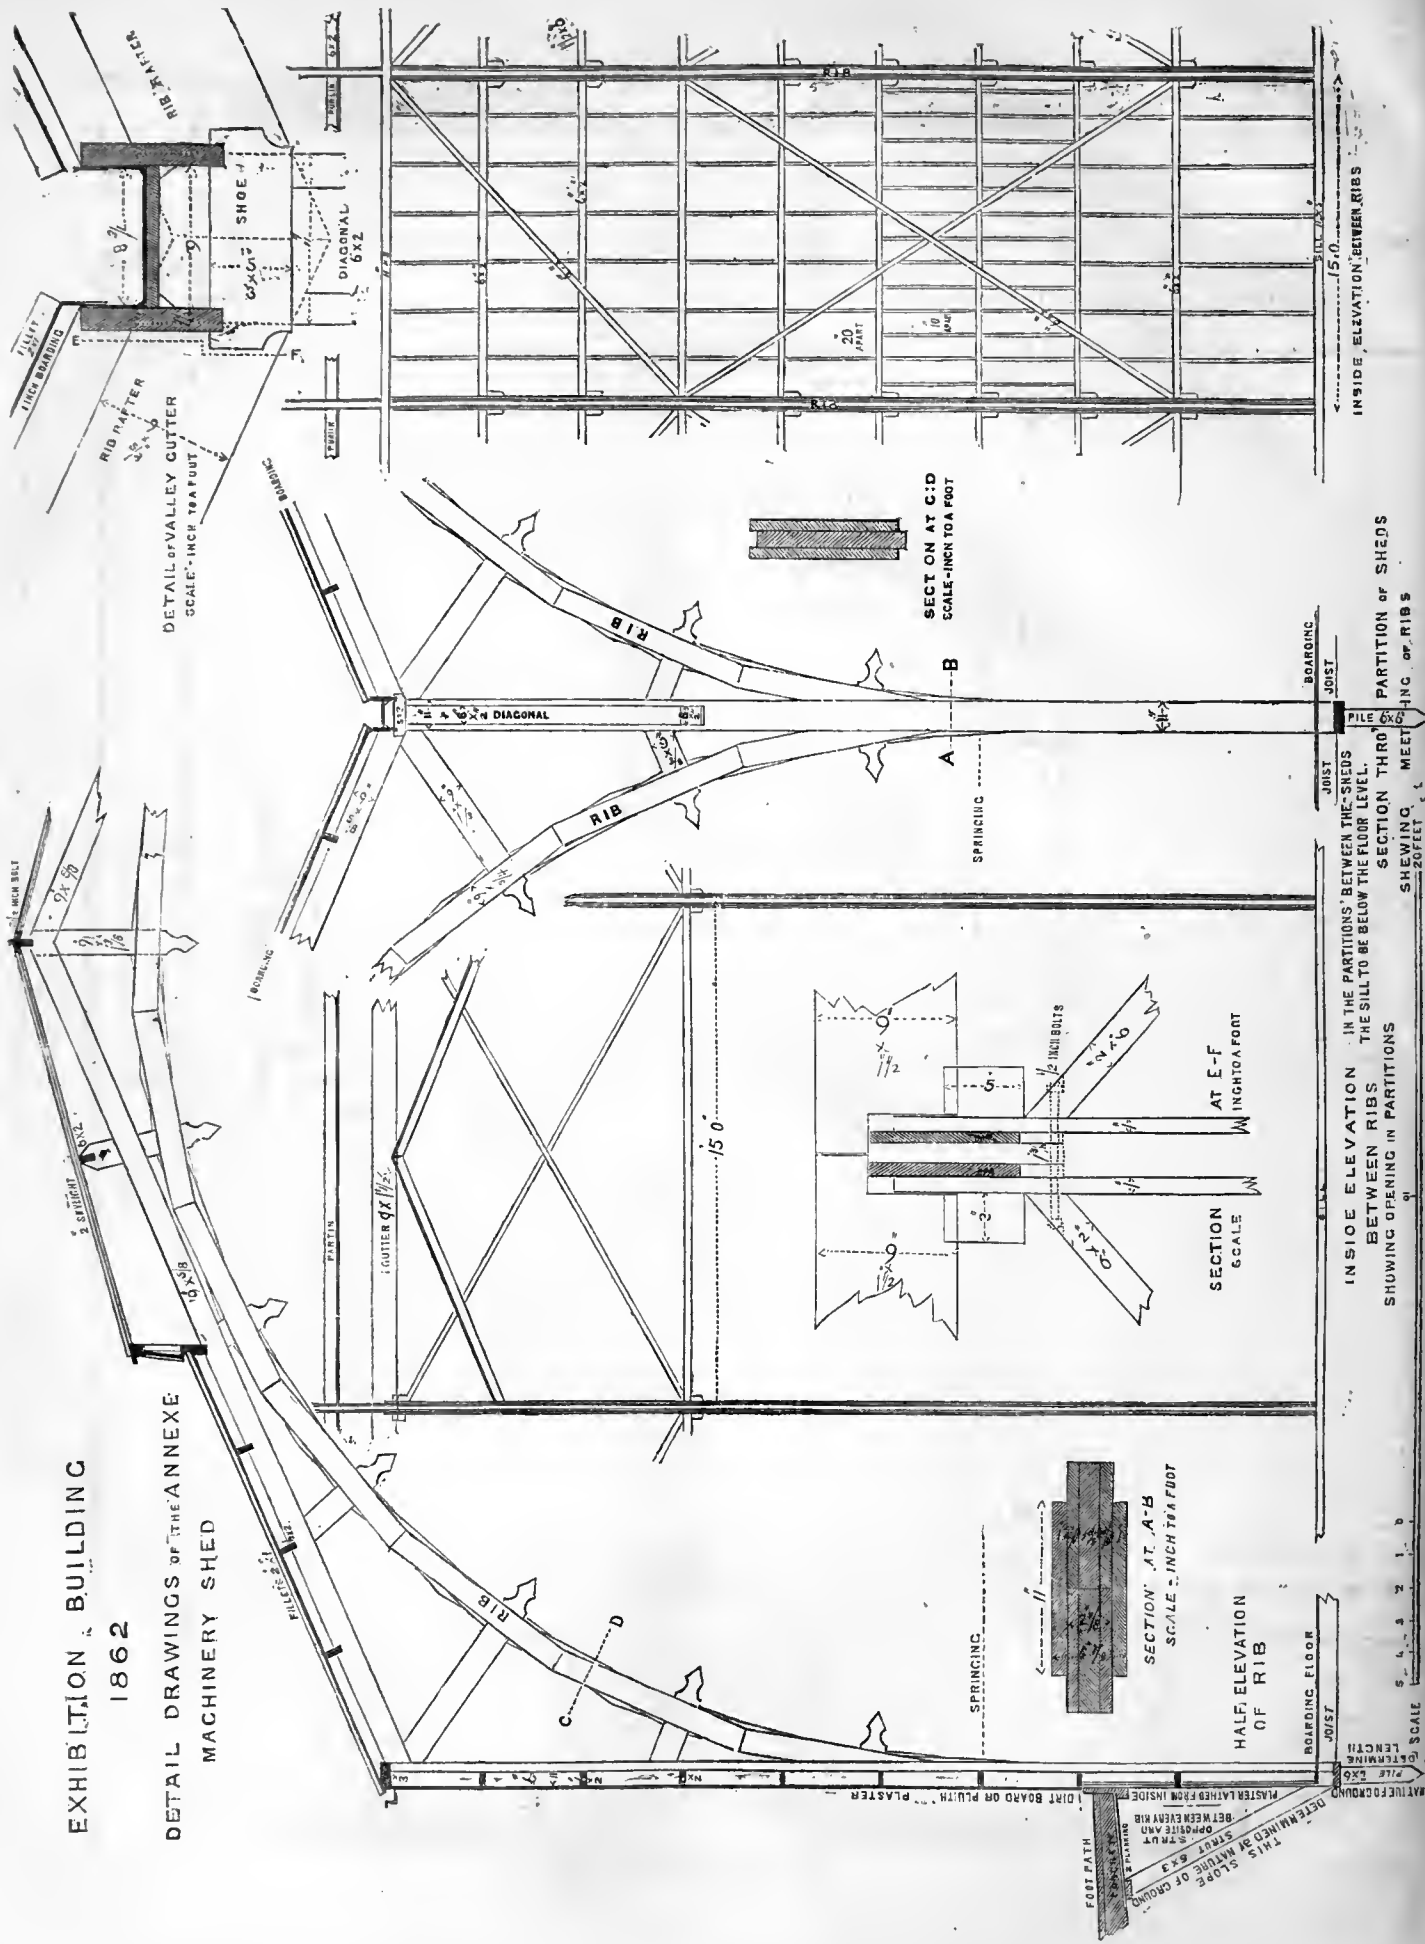

At the present moment considerable works are being carried out at the Palace. The floors of the building in the tropical and southern ends have been replaced with brick walls and piers round each flower-bed in place of the original wooden supports. A new wide triple staircase has been erected, leading from the great transept to the basement, so that the crowds assembled at the Palace on days when the great fountains are played, and other popular occasions, may escape from the building to the gardens, and *vice versa*, without the pressure and inconvenience so often complained of. The enormous roof over the great Handel Orchestra is being rapidly preceded with for the great musical celebration to be held during the coming season.

INSTITUTION OF CIVIL ENGINEERS, IRELAND.—At a meeting of this body on Wednesday evening, the 9th inst., at New Museum Building, Trinity College, Dublin, Professor Dowling in the chair, Mr. Blakiston, C.E., was proposed and admitted a member, and Mr. J. J. Lyons, architect (proprietor and editor of the *Dublin Builder*), an associate. Mr. G. H. Stryke read a paper on "The Construction of the 50 ton crane, Dunbar's Dock, Belfast." It will be found in *extenso* in the *Dublin Builder* for the 15th inst.

1862

DETAIL DRAWINGS OF THE ANNEXE MACHINERY SHED

THIS DRAWING IS A COPY OF THE ORIGINAL DRAWING IN THE ARCHIVES OF THE ARCHITECTURAL DEPARTMENT OF THE CITY OF NEW YORK. IT IS NOT TO BE USED FOR CONSTRUCTION PURPOSES WITHOUT THE PERMISSION OF THE ARCHITECTURAL DEPARTMENT.

ARCHITECTURAL ASSOCIATION CONVERSAZIONE AND DISTRIBUTION OF PRIZES.

THE Architectural Association *conversazione* for the distribution of prizes took place on Friday evening, when there was a very numerous attendance of ladies and gentlemen. Amongst the gentlemen present we noticed Messrs. A. W. Blomfield, M.A., President of the Association; Thomas Blashill, G. B. New, C. F. Hayward, R. P. Spiers, R. O. Harris, E. H. Lamb, Randall Druce, Teulon, Morris, H. A. Darbyshire, — Oliver, — Isaacs, D. Brandon, J. P. Seddon, B. J. Benwell, &c.

Shortly after 9 o'clock the chair was taken by Mr. BLOMFIELD, the President, who remarked that upon such occasions it was usual to compress the business part of the proceedings into as small a space as possible. That evening the only business was the agreeable one of the distribution of a certain number of prizes. The principal prize was the annual one given by Mr. Tite, M.P., and the Committee of the Association were in hopes that he would be present that evening to give the prizes, but they had received a note to say that his health would not allow him to be present. Had Mr. Tite been present he would not doubt have made some useful remarks, and given some wholesome advice. The prizes had been awarded in the following manner:—Mr. Tite's prizes for the best designs for a Town Mansion, first prize to Mr. H. Hack, and the second prize to Mr. A. Walters. (The successful competitors for all the prizes, which were professional books, received the rewards for their skill and industry from the Chairman amidst loud applause.) The next prizes were for the best designs for a tiled pavement, first to Mr. E. Wimbridge, second to Mr. P. B. Hayward. The next prizes were for the best designs for a piece of wall decoration, first prize to Mr. E. J. Tarver, and the second to Mr. E. Wimbridge. The prize designs were exhibited in the great gallery. He was sorry that the agreeable task of giving the prizes had not fallen upon Mr. Tite, or some senior member of the profession, and had much pleasure in calling upon Mr. Lamb to make a few remarks.

Mr. E. B. LAMB regretted that Mr. Tite, who was always so eloquent on such occasions, was not able to be present and to fill the place which he felt himself so incompetent to occupy. It was gratifying to him, and it must be to all lovers of art, to find the rapid progress which had been made in architecture for some years. Though not an old man, he could recollect the time when architecture was little known and little thought of. When he commenced the study of architecture there was no Royal Institute of British Architects and no Architectural Association. There were a few meetings held of a professional character, but in such remote places that they were little known, and less thought of. But still the feeling for art was progressing. They had Britton's works paving the way; John Carter had previously done his work, and commenced the resuscitation of Gothic architecture, and Pugin the elder laid the foundations in a sound and solid way for the instruction of those who loved the art. They had in those rooms the works of the more recent Pugin, examples of industry, study, talent and thought, which made it a marvel how he could have done them. In the course of time sprung up the Institute; then, or he believed previously, the Architectural Association, or some such society, was established. The Institute became an association of the older members of the profession, useful in its way for concocting, arranging, and settling disputes in matters of minor importance; while the Architectural Association was founded for the benefit, instruction, and advantage of the younger members of the profession. He found that there were many younger members of the profession who were rising up with considerable talent, and they had at that moment an instance before them, in the works for which the prizes given by the president of the Institute had been awarded. The fact of younger members of the profession rising to improve themselves and to make a school of their own was a great epoch in the annals of art, especially in the architectural profession. He had heard Mr. Tite say that in his younger days considerable difficulty was experienced in the study of the art; there were then no books published, or very few, and in fact there was nothing to bring out the talent of the individual. It was left to the individual to work his way as best he could, but now the difference was evident in every way. At the corners of the streets they had examples of the masters of the art, and they had the actual facts, the photographs of buildings all over Europe and indeed the world, placed before them in an absolute form. They had no occasion now to go to Egypt, Rome, or Athens, to study the architectural art, and it was gratifying to find that young men were taking advantage of the benefits offered to them. But this should be considered, that the best examples should be studied carefully—not to be copied but to be emulated. Now, he had no doubt the younger members of the profession would do so, and the Architectural Association was a school formed to accomplish that object. He would have all to think for themselves; let them consider that architecture was not a mere profession of rule and line and compass, and let them bear in mind that those who followed it were artists, and that their great aim was to produce a picture, and to bring all the details into a beautiful form. Artist materials should be employed so as to produce a pleasing effect on the beholder. The painter had done that, and why should not the architect? Architecture was a fine art, and it was so connected with painting that it was inseparable from it. The same laws that governed painting governed architecture. The artist took his palette and colours, and produced a great work on his canvas; the architect took his palette, and with hard materials produced his painting on the ground. The two had to produce the same effect—that was a picture. He would recommend the younger members of the Association to remember the necessity for young men keeping in view that they had to form a place in a noble profession, but one that required intense application, constant study, and constant thought. Though young men might have the advantage of studying under the greatest men of the present age, they must not think that the masters could do everything for them. Unless the pupil was studious and willing to learn, unless he got not only the run of the office, but gathered fruit from every turn, he would not be successful. The younger members of the profession had to consider not only what the master taught directly, but what he taught indirectly, and much advantage might be gained by the study of drawings which passed through an office; and he was happy to say that he could see from the progress going on in art that young men were taking advantage of those things. Now and then they heard a pupil complaining that he had not been instructed—that he had not gained the information he ought to have gained—and he blamed his master. But if such a pupil were a little to consider his own ways, and to think of those portions of his time which he had constantly wasted instead of using them in the gathering of information, he would blame himself more than his master. He felt a great interest in the

profession and a great interest in the rising generation of architects. He was exceedingly anxious that in the future architecture should take that position which it ought to do, and which it ought always to hold. He remembered reading a few years ago, in a journal, where he was surprised to find such a statement, that architecture had been ignored as one of the fine arts, that it was not one of the fine arts, and ought to be kicked out of the Royal Academy. That was a remarkable incident, arising from what cause he could not tell at all. He would impress on the younger members of the profession that architecture was a fine art—not a mechanical art; that it was an art of mind, that it required intense application, a predisposition for it, and a thorough analysis of the works necessary to produce it. It was very frequently the case that talented young men, whose nature had been blessed with the power of producing clever compositions, would bring them on paper and lay them down, and they were praised, and properly praised, for their talented works. Well, one of the best things for such young men to do was to criticise their own works, and to analyse them to the most minute detail; and they should be careful in their criticism of the works of others; they should not descend to ridicule, for in art nothing was so painful or degrading as to attempt to turn that which was intended to be a fine work of art into ridicule. They had too many instances of criticism of that kind, but he would not dwell upon them. However, young men should criticise their own works, and not ridicule the works of others. It was very gratifying to him to find that such clever designs had been produced by the young men of the Association, and that prizes had been awarded to them.

Mr. G. GODWIN wished success and continued prosperity to the Architectural Association. He should have been glad to see more members of the profession there that night. He thought if the older members of the profession would take the pains to come amongst the younger members of the Architectural Association, and likewise exhibited their designs in the Architectural Exhibition, they would derive an advantage thereby, especially in the admiration of the younger members of the profession. There was no question as to the great advantages derived from the establishment of the Architectural Association, and many architects now in high places had been members of it. He had reason to believe that there would be a very extraordinary display of architectural drawings at the forthcoming Great Exhibition, not only British, but French and Belgic, and he had no doubt from what he heard that Britain would hold her own, as she had at other Exhibitions.

THE PRESIDENT said it could not be too generally known that on all occasions like the present the members of the Association were too proud to have the older members of the profession present.

Mr. J. P. SEDDON, as an old member of the Association, and remembering the great advantages he had received from it, wished to say a few words. Though not now a member of the Association, he read, with much interest, the reports of its proceedings in the professional journals, and was glad to find that the Association had a regular course of professional study. One great advantage of such an Association was the enthusiasm which a number of young men gave one to the other, the emulation it caused, and the rubbing off angles which all of them had. Young men ought to study thoroughly whatever subject they had in hand, and to produce a good thing rather than a new or original one. And particularly while they were students they ought to carry out a constant method of studying, taking up one branch and then another, and studying it well, instead of going on desultorily, and in that way they would advance the profession. If each member of the Association would work out one building, or one part of a building, and compare notes with his fellow members at the end of the session, greater good would be effected than by the adoption of cruder notions of design. He was exceedingly glad to find that the Association had a modelling class, which must prove of great advantage. He recommended them to practise the drawing of the figure—they ought to do that, or they would never excel.

LEICESTERSHIRE ARCHITECTURAL AND ARCHEOLOGICAL SOCIETY.

THE usual bi-monthly meeting of this Society was held in the Town Library, Guildhall, Leicester, on the 31st ult.; the Rev. G. E. GILBERT, rural dean, in the chair.

A letter from the editor of the *Gentleman's Magazine* was read, from which it appeared that unless that magazine is better supported by those interested in antiquities, there is a probability that, after an existence of 130 years, its publication will be discontinued.

Mr. C. J. LEA, of Lutterworth, exhibited, through Mr. North, one of his outline drawings of a series of mural decorations he is now at work upon for a new church at Rochdale, dedicated to St. Alban, the Proto-Martyr of England. Mr. Lea has sent to the International Exhibition a screen showing the whole of the decorations, from the floor to the cornice, of one space between the windows on the north side of the chancel. The portion sent to the Exhibition is about 20 feet high by 4 feet wide, and shows the proposed scheme for the whole of the decorations, which consist of drawings depicting the principal events in the life of St. Alban. The whole of the subjects will fill up all the available space on the chancel walls between the windows, the figures not going higher than the springing of the window arches. The wall space below will be line diapered, with emblems, &c., occasionally introduced. That part of the wall above the windows and figures will be filled with conventional foliage, diapering, &c., and the roof will be richly coloured and gilded. The carved stone canopy to sedilia, as well as the carving to the chancel arch and organ screen, will be gilded.

Mr. NORTH remarked that Mr. Lea had lately secured the extra colour prize offered by the Ecclesiological Society.

The Rev. J. H. HILL exhibited a small coin of Constantine, found at Medbourne, and a shilling of Charles I., found between Cranoe and Glooston.

Mr. FETCH exhibited some Anglo-Saxon antiquities, found about two years ago, with a number of skeletons, upon high ground on the north side of that town. They consisted of a number of beads, of different sizes and materials, and the remains of a knife; pottery was also found, but the workmen being ignorant of its value, did not attempt to preserve any vessels, or remains of vessels which came in their way. Since then other operations have been carried on upon the land, and although every care has been taken to examine the earth, and to search for relics, nothing beyond several skeletons has been found. These, however, and the peculiar geological formation of the ground, are not without considerable interest, as appeared from a communication addressed to the secretary by Mr. Ingram, of Belvoir, who was at Melton to watch the working of the ground.

Mr. G. C. NEALE exhibited water-colour drawings of Skeffington Church (interior) and Billesdon Church (exterior) before their recent restoration.

Many other subjects were communicated, and the Rev. J. H. HILL read a paper upon the Langtons of Lincolnshire, which he illustrated by two worked pedigrees of that family.

INSTITUTION OF CIVIL ENGINEERS.

At the meeting on April 1, JOHN HAWKSHAW, Esq., President, in the chair, the first paper read was on "Railway Accidents—their causes and means of prevention, showing the bearing which existing legislation has upon them," by Mr. JAMES BRUNLEES, M. Inst. C.E.

The author proposed to treat the subject by dealing with the facts as they were, the causes of accidents being, in nearly all cases, sufficiently apparent; he would not, therefore, attempt by theory to establish rules for their prevention. From the reports of the officers of the Board of Trade, it appeared that during the seven years from 1854 to 1860, the number of accidents amounted to 540, as the result of 1,274 distinct causes. Of these accidents, 11 per cent. were attributed to the permanent way, 7 per cent. to the rolling stock, and 76 per cent. to the management, including insufficient means for securing safety, leaving only 6 per cent. as not ascertained.

The accidents due to the permanent way were then referred to in detail, and it appeared that the general defects were most evident in the system of ballasting, of joint-fishing, of turning the rails, and of fastening the chairs to the sleepers. With regard to the ballast, it was argued that it would be found economical to have at least 6 inches or 9 inches of rough gravel or broken stone, as a free draining bed to the sleepers and to the "top-dressing;" and that, during the months of September and October, an extra number of men should be employed to drain the ballast and beat up the road, in order that it might become consolidated before the winter's rains and frost set in, and thus avoid the evil effects of frost or wet ballast. It was urged that the plan now in general use, of placing the fish-joint between two sleepers was objectionable, as the ends of the rails were unsupported except by the fish-plates, which together were frequently only equal to two-thirds of the section of the rail. It was submitted that all the joints should be fished directly over a sleeper, or that a bracket chair should be used. The practice of turning the rails was condemned, because when a rail was so much worn as to require turning, its strength was generally so reduced as to render it unfit for main line traffic. With regard to the fastenings of the chairs to the sleepers, it was urged that it was desirable that iron spikes only should be employed on the outer side of curves, or else that the chair should be partially sunk into the sleeper, to lessen the strain on the treenail. The superior economy of steeled, or partially steeled, rails, points, and crossings, was also incidentally noticed.

In reference to the accidents which had arisen from defective or neglected rolling stock, it was found that many of the fractures had occurred during the winter months, owing, possibly, in some degree, to the rigid state of the "way" in frosty weather; whilst others were due to the use of bad iron, and some to defects either in the welding of, or in the mode of attaching the tyre of the wheels. Steel, or partially steeled, tyres were now, to a certain extent, in use, and tyres formed of a continuous ring, or unwelded piece of metal, were also successfully employed. Several new methods of fastening the tyres had proved as fruitful of mischief as the ordinary plan of simply shrinking them on, though others had been found to be efficient; and it was said that on some lines the tyres had not failed to any great extent. The author hoped that the importance both of the tyres and of the axles of wheels would lead to a useful discussion on this branch of the subject. The usual want of uniformity in the main features of the carriage portion of the rolling stock was then commented upon; and it was considered that this variety not only increased the cost of manufacture and of maintenance, but was often the cause of accidents, and frequently contributed to render them disastrous. The author thought that the carriages should be nearly uniform in size, and that the buffers should in all cases be the same height above the rails. The longitudinal beams should be in the same line throughout, be strong in themselves, and the framing securely braced. The present coupling in the centre should be increased in strength, and the whole attachment between the carriages should be such as to render a train in effect, as far as practicable, as one carriage, with a certain amount of flexibility; so that in the event of collision the carriages should retain their position, instead of rising upon one another; and if an axle or a wheel broke, the crippled carriage should be partially borne up by the neighbouring carriages until the train could be stopped.

On the question of management, after some remarks upon the speed of trains, it was shown that by punctuality, both in the time of starting and in the rate of running, safety, so far as human foresight was concerned, was insured. The system of working the traffic of a railway by allowing an interval of time between the trains was deemed unsatisfactory, and far inferior to the system of an interval of space. The accidents arising from the irregularity of excursion trains were then alluded to, and it was remarked that if, during the summer and autumn, the ordinary trains were run at lower rates of fares, the traffic would be increased, as the public would feel greater security in travelling. The difficulty in running coal or mineral trains to a fixed time-table might be met by a more general use of the electric telegraph, and by a better system of signalling arrangements. During the seven years, from 1854 to 1860, inclusive, eighty-eight accidents happened from inefficient signals, of which fourteen occurred in 1860. In some cases, especially at sidings, there were no signals; in others they were defective in form, or were improperly placed. It was desirable that junction signals and points should be worked simultaneously by one man, and at junctions, separate main and distance signals should be provided for each line. If the system of working the traffic by the electric telegraph was generally adopted, and the line was divided into sections, so that a train should be prevented from entering any section until the preceding one had passed to the section in advance, collisions would be impossible, except those liable to arise from disregard of the signals; and a proper interval would be secured between the trains, in spite of unpunctuality. As the want of a means of communication between the engine-driver and the guard, or conductor, had frequently been experienced, and as plans were in daily use on several lines, there was no reason why it should not be adopted on all. To render it fully effective, the guard, or conductor, ought to start the train from each station by means of that machinery, so as to prove that it was in working order. Owing to the general high speeds and heavy trains, it was of the utmost importance that ample break power, capable of being applied in the least time, should be provided with each train. It was a question how far a regularly distributed retarding force, acting at the same moment on all the wheels, might not be preferable to a concentrated force applied at particular points. By the system of "continuous breaks," the employment of several men with each train was unnecessary. It had also another advantage, that a train was more under control, and could be stopped in a shorter distance. The negligence of servants, arising from their ignorance or inefficiency, was next adverted to, and it was thought to be due to the pay being too low to command the services of men of intelligence, steadiness, and self-reliance. Frequently they were insufficient in number, leading to overwork, and instances were on record in which engine-drivers had been employed for seventeen hours daily, and in some cases for twenty-six and thirty hours continuously.

The author observed that Government interference was not likely to render railways safer, or more available to the traveller; and that it would be better to rely on the consideration and calm reflection of those immediately interested in these enterprises, especially as from the heavy expenses attendant on accidents, directors and shareholders would naturally desire to render this mode of travelling as safe as possible.

The second paper read was also on "Railway Accidents," by Captain DOUGLAS GALTON, R.E., F.R.S., Assoc. Inst. C.E.

It was stated that the length of railway communication opened in the British Isles at the end of 1860, was 10,433 miles, upon which 163,435,678 passengers were conveyed in that year. From official returns it appeared, that during the seven years ending the 31st December, 1860, there were 116 passengers killed, and 2,832 injured, from causes beyond their own control. From the sums paid by railway companies for compensation, it was calculated that an insurance of one twenty-fourth part of a farthing per passenger per mile would, on the average of all lines, cover the cost of railway accidents. It had been found impossible to obtain reliable information, as to the number of coach accidents in this country. But the returns of the "Messageries Impériales" showed, that in a series of years, the number of passengers killed and injured, from causes beyond their own control

was one in 28,000. From the latest comparative returns, the number of passengers killed and injured was, on British railways, 1 in 334,000; on Belgian railways, 1 in 1,600,000; on Prussian railways, 1 in 3,000,000; and on French railways, 1 in 4,000,000. The greater comparative safety of foreign railways was traced to differences in the condition of the traffic and of the management, as well as in the habits of the people.

In endeavouring to elucidate the question, whether any of the accidents which had occurred could have been prevented by reasonable precautions, the first point which arose was, the extent to which the amount of traffic on the several lines influenced the number of accidents. The general averages thus obtained showed, that lines of small traffic were comparatively safe. But as traffic alone did not determine the number of accidents, it was necessary to analyse the causes in detail; taking, first, those which could not be guarded against, and, secondly, those which were within the control of the management, or working staff. During the seven years before referred to, 534 accidents to trains had been reported upon by the Inspecting Officers of the Board of Trade, in which 2,912 passengers were killed or injured. In many of these cases there had been more than one contributing cause, but the majority might be thus tabulated:—

	Number of Accidents reported upon.	Number of Sufferers.	Cases in which the Accidents could not be guarded against.	Cases in which the Accidents were due to Causes within the control of the Management.		
				Attributable to the Works or Rolling Stock.	Attributable to the system of Working.	Negligence of Inferior Servants.
Accidents from Engines and Carriages leaving the Rails, or Fractures of Machinery	135	313	59	98	15	17
Collisions of every description	319	2,532	16	222	219	183

These figures showed that a large proportion of the so-called accidents were due to preventable causes. Those arising from the fracture of axles and tyres, and from engines and carriages leaving the rails, were less than one-half of the number which could not have been guarded against. But out of the 319 collisions, only 16 were attributable to purely accidental causes, whilst 183 were assigned to the negligence of inferior servants, and 120 to the manner in which the traffic was conducted, and which ought not, therefore, to have occurred.

With regard to the first class of cases—accidents which could not have been guarded against—the author remarked, that the best form of tire for a railway wheel had not yet been definitely settled. The wheels and axles could scarcely be said to be mechanically satisfactory; the form of break in use was also imperfect. Although simple negligence could not be entirely prevented, yet in several cases the negligence had been attributable to the defective arrangement of the company, in permitting pointmen and engine-drivers to be habitually over-worked. Those accidents which arose from trains passing on to a wrong line through facing-points, might not have occurred if an indicator had been attached to the points, to show in which direction they were set. The comparatively small number of accidents from negligence alone afforded strong evidence of the efficacy of the direct responsibility of the inferior servants. A few instances were then cursorily alluded to, in illustration of those accidents which were wholly or partially attributed to defects in the condition of the railway, or the vehicles, or in the absence of the requisite auxiliaries to safety, such as signals, breaks, &c. It was observed, that it was not for want of good rules that accidents occurred, but for want of a continued enforcement of those rules, and a close examination into the details of the manner in which the traffic was worked.

The discussions which had taken place on this subject in Parliament, both in 1853, and again in 1857, were then considered, and the conclusion was arrived at, that freedom from railway accidents was not to be obtained by Government interference, but by an effective and responsible internal management, which would enforce the greatest punctuality and care in working the traffic, and maintain the strictest discipline amongst the servants employed.

The existing law affecting railway companies as carriers was then alluded to; and attention was next called to the principle of compensation for injuries sustained. Lord Campbell's Act being specially cited as the Parliamentary recognition of that principle. It was said that this Act removed a technical difficulty in the way of recovering compensation, rather than gave a new right to compensation. The money payment, thus provided, operated as a punishment, and tended to prevent the commission of careless acts. Compensation might, therefore, be looked upon, partly as a penalty upon the Company for its corporate carelessness, and partly as a remedy to the sufferer for the injury received. If viewed as a remedy, it should be such as to tend to prevent a recurrence of the act for which punishment was awarded. It should, therefore, depend on the degree of blame which attached to the management for the accident, and it should be equally certain and just in its operation. In its aspect as a remedy, it should be easily recoverable by the sufferer. As at present levied, it did not properly fulfil either of these conditions, for reasons which were stated. Assuming that such a maximum amount was fixed upon as would fairly compensate the generality of passengers, according to the class in which they were travelling; and assuming that it were made payable in the case of every accident which occurred beyond the control of the passengers, without there being any obligation to prove negligence, the author was inclined to think that the fine would be rendered more certain in its operation, but that as a preventive the effect of the alteration would not be appreciable. The true remedy against railway accidents lay, in the author's opinion, with the railway companies themselves. Improved management would be greatly assisted by placing at the head of each railway a director of adequate capacity, responsible to the Board for the management of the concern, who should be required to devote the whole of his time to its interests, and be paid in proportion;—by giving the chief officers of the railway control of, and making them responsible for, the several departments, so that they might be held answerable for the results; and by providing a gradation of responsibility throughout all the employés. Improvements in the machinery, and system of working might be promoted by the formation of an Association amongst railway companies, embracing the objects of the association between the German railway companies, and of the association between manufacturers, near Manchester, for the prevention of boiler explosions. It was doubtful, however, whether such an association could become of any practical utility in this country, unless it assumed the form of an association for the purpose of mutual insurance against accidents, managed by a Board of railway officials, chosen from the associated companies.

At the Monthly Ballot the following candidates were duly balloted for and elected:—Messrs. W. Henderson, W. H. Mills, A. Samuelson, C. I. Spencer, M. O. Tarbotton, and T. Waring, as members; and Messrs. C. C. Adley, It. G. Coke, W. Dunlop, G. Pownall, and S. L. Tomkins, as associates.

OPENING OF THE INTERNATIONAL EXHIBITION.—*Punch* says—"By a notice in the *Gazette*, we learn that the five Commissioners charged with the inauguration of the building designed as a Temple of Industry, Science and Art, are as follows:—Mr. Fairbairn, Mr. Faraday, Mr. Richard Owen, Mr. Alfred Tennyson, and Mr. Daniel Maclise. The report that the ceremonial was to be under the superintendence of a soldier, an archbishop, and some lords, is contradicted, and the above list appears in ample vindication of the good sense of the Directors.

ARCHITECTURAL MUSEUM.

AS we briefly announced in our last, the Rev. Lord ALWYNE COMPTON delivered a lecture, on April 8th, in the theatre of the South Kensington Museum, "On Encaustic Tiles and Tile Pavements." The lecture was illustrated by many drawings of tile patterns, and of tile pavements to be found in various edifices throughout the country, and the chair was occupied by Mr. A. J. B. BERESFORD-HOPE, the president of the Architectural Museum.

Lord ALWYNE COMPTON, having been introduced to the meeting by the president, said he had been requested by the Committee of the Architectural Museum to give a lecture on encaustic tiles and tile pavements. When first asked he was unwilling to accept the invitation, first, because it was a dry subject, although any antiquarian might make an object of antiquity interesting by wandering far away from it. In that point of view, tiles might be made interesting in reference to the heraldic theory of ornament, and in some cases might have an effect on history, but he wished to speak of tiles chiefly on their own account. The second reason for being unwilling to accept the invitation of the committee, was that, some years ago, he had the pleasure of giving a lecture on the same subject when the Institution assembled in a garret in Cannon-row, and since then he could not say he had added much to his knowledge on the matter. He should speak of encaustic tiles first in an antiquarian point of view, such as studying old churches simply for their own sake; the practical view was how they were to make use of them in their churches and secular buildings. In examining any subject in an antiquarian point of view, the first thing the antiquary wanted was his date, without which his inquiry was of no value at all—he must first know the dates of his examples. In fixing the dates there were many difficulties. They might go into an old church, such as the cathedral church at Gloucester, where there were a great number of tiles, but, on seeing a single pattern, it was very difficult to say to what date it belonged. He thought the first step in settling the date of tiles was to classify the tiles into sets, that was, a class of tiles of a given date and of the same manufacture. In arranging tiles in classes there were two or three things to be borne in mind. The first thing to show the tiles belonged to a certain class was that of their being used in the same original pavement. All the tiles occurring in a particular arrangement were put down, he presumed, at the same time. When he found a great number of tiles coloured and in the same arrangement, he assumed they were of the same date and of the same manufacture. But there were exceptions to that assumption; there were cases where one tile of a set had even been met with while the others were not, from which it might be thought the manufacturer had gone on making one particular kind of tile. It was clear, therefore, that tiles having the same arrangement might yet be of different dates. The similarity of patterns was another way of fixing the dates and the manufacture of tiles. When they found in a church thirty or forty patterns, and other thirty or forty more all generally having a similar character, they might conclude they were of the same date, and by the same manufacturer. Having arranged the tiles in classes of the same date and by the same manufacturer, the lecturer proceeded to point out on the diagrams tiles of various classes or groups. Having got the tiles into classes, the next thing was to date them, and there were various ways of fixing the dates. First, there were a few tiles that had got the date on them, as at Gloucester. There were other tiles which were originally intended to be erected as a border to a wall, dated. There were tiles in Devonshire having dates, one of them being 1708. Then, when there was no date on the tiles they could sometimes find out the date by the armorial bearings; but sometimes tiles were found without any armorial bearings, yet clues were found to distinct dates. But heraldry on tiles was of great use in fixing the dates. He next came to the question of the patterns for the fixing of the dates of tiles; it was not a very satisfactory one, but still it had much to do with the matter. Another mode by which dates were fixed was, examining inscriptions upon tiles. Another mode of finding dates was by examining carefully the portions of the building where the tiles were found. Such were the various modes of dating tiles,—first, from dates actually on them; secondly, from armorial bearings; thirdly, from inscriptions; fourthly, from the patterns; and, fifthly, from the buildings in which the tiles were found. Adopting this mode of examination, the rev. lecturer explained, by means of the drawings on the wall, the probable dates of a great number of tiles found in various buildings, as at Salisbury, Winchester, Westminster Abbey, various parts of London, Exeter, Romsey, York, Leicester, Hampshire, Coventry, Bristol, and some other places. In some of the buildings the same pattern occurred again and again, but still of some patterns there was great variety, there being some slight difference in the design. The lecturer then referred to the drawings on the wall, and fixed the probable dates of tiles occurring in Sussex, Buckinghamshire, Bedfordshire, Ely, Gloucester, Malvern, Devonshire, and various other places throughout this country. He wished next to speak of the arrangement of the tiles; and in arranging the tiles it was found that there were a great many examples of fragments of pavements and of incomplete ones. As to a small room, it was usual to enclose it with tiles of one pattern; but, when the room was larger, more patterns were introduced (which he explained by reference to drawings of tiles found in various parts of the country, and from which it was shown that the divisions of the three panels in a room were very different in different places). Then, as to the pavement of a whole church or cathedral, in that case a very peculiar pattern ran from column to column, and the whole of the aisles were richly paved. The whole of the pavement was next sub-divided (the mode of doing which his Lordship explained by reference to the drawings by which the lecture was illustrated). The rev. lecturer, in the course of his observations on this part of his subject, observed that the green tiles of Mr. Minton combined most beautifully with red ones, and explained drawings of a number of pavements found in different churches; first, of specimens having a square of one pattern, and afterwards of pavements of a later date in which were found several patterns in the squares. Another mode of arrangement, the lecturer pointed out, was that of having the tiles cut out and put together, as at Ely. There were two or three ways of laying down new pavements. The first was to copy an old pavement, and in laying down pavements it would be found that a mistake often committed was, that tiles of different dates were laid down in the same pavement, which, of course, made them incongruous. To put down a pavement in 1862 of different tiles and dates was a perfect absurdity, and that was an error that arose from not copying. The next method was to combine old pavements, and that was what he should strongly suggest to architects and others who designed pavements to do. Mr. Shaw had published some useful information on this subject, and he (Lord A. Compton) had combined tiles in this way for friends. The third way of doing a modern pavement was to invent it, and they might invent a tile, and

might invent a pavement. But he thought the best way to advance in pavements, as in other architectural matters, was to begin by careful copying. That was what was done years ago, and we now could see fine original works in Gothic monuments in London and in cathedral churches, works which were essentially original, but they were the works of men who began by carefully studying the works of the ancients. As to the question of the colour of tiles, the lecturer remarked that green, black, buff, and red, were four colours which in combination were exceedingly beautiful. But, besides those, what he might call China colours were used, white, blue, green, and yellow, different from the first mentioned. (He referred to drawings of specimens of such tiles at the establishment of Mr. Maw.) Great care was required in the arrangement of colours, especially where white lines were introduced, as they caught the eye very much; much skill and care were required in the matter, so as to produce a good effect. Unless the tints were arranged in a pleasing way, the whole would not combine satisfactorily.

On the motion of Mr. BERESFORD-HOPE, a vote of thanks was passed by acclamation to Lord Alwyne Compton for his excellent lecture.

LONDON DIOCESAN CHURCH BUILDING SOCIETY.

THE annual meeting of this society was held at Willis's Rooms on the 10th inst., the Bishop of London presiding. The report, the adoption of which was moved by the Earl of Ellesmere, stated that in the last year the society had aided in establishing eight mission chapels and mission rooms. In the short space of 10 years the population of the metropolitan districts had increased by 440,798, according to the last census. The Ecclesiastical Commissioners were now fully prepared to recognise the claims of those parishes in which they held property, according to the intention of a recent Act of Parliament; there were, however, but few London parishes in which the Commissioners had property. The receipts of the society during the year had been £7,577 odd, of which £5,176 was on account of the general fund, and £2,401 of the Mission fund. In addition, a legacy of between £2,300 and £3,000, would soon be received. The grants made by the society during the past year had been unusually large—viz., £8,996 as compared with £6,885 in the previous one. Nine new churches had been consecrated since the 1st of May last, and five temporary churches had been opened. The parishes in which new churches had been consecrated were St. Pancras; Islington; St. James's and St. John's, Westminster; Tottenham; St. John, Paddington; Spitalfields, and Hampstead. The temporary churches and missions-rooms which had been opened were in the parishes of West Ham, Ealing, St. Martin-in-the-Fields, St. Gabriel's, and Bromley-by-Bow. Works were in progress or in contemplation in 24 parishes. The diocese of London contained a population of about 2,500,000, and was increasing yearly at the rate of nearly 50,000. There are in that diocese three parishes with populations exceeding 35,000; four with between 30,000 and 35,000; five with between 25,000 and 30,000; six with between 20,000 and 25,000; sixteen with between 15,000 and 20,000; and thirty-two with between 10,000 and 15,000. The total provision for public worship was less in Middlesex than in any other English county. One hundred new churches at least were even now required. Were this number erected, it would still be necessary to build about fifteen churches every year to provide for the thousands annually added to the population. But the number built yearly, taking the average, was only eight. Thus the deficiency is growing greater every year. The Bishop of London stated that the character of this Society was essentially practical, and that it was not by exciting speeches or crowded meetings that it made its way. In eighteen years, during the episcopate of Bishop Blomfield, £266,000 was subscribed for the precursor of the Society, of which £80,000 was specially contributed for Bethnal-green. Seventy-eight new churches were by those means built in the diocese. There was collected from local sources £270,000, making a total of considerably more than half a million. No diocese, he submitted, could dispense with such an institution, certainly not that which increased in population by 50,000 a year and which had added half a million since the census of 1851.

Among other speakers at the meeting were Archdeacon Hale, Canon Wordsworth, the Rev. A. W. Thorold, and Mr. Beresford-Hope. Resolutions were passed to the effect that the results of the last census rendered more than ever apparent the urgent necessity for extending and strengthening the parochial system among a population increasing with such unexampled rapidity as that of London, and that the present system of the Diocesan Society, embracing as it did a complete scheme for meeting the spiritual wants of every class, although having special reference to the interests of the poor, was eminently calculated to meet the necessities of the case, and deserved largely-increased support from all the Churchmen of the diocese.

CHELSEA SUSPENSION BRIDGE.—Sir J. Paxton having asked the First Commissioner of Works if there was any truth in the rumour that the traffic over the Chelsea suspension bridge was restricted by the police, on account of some defects in the structure, and if the bridge would furnish safe accommodation for the traffic arising from the Exhibition and the Royal Agricultural Show shortly to be held in Battersea-park, Mr. Cowper said that Mr. Page when he designed the bridge intended the light traffic to go over one portion of it, and the heavy traffic over another. He arranged the roadway for light traffic by placing planks of oak upon bitumen, that bitumen resting upon a concrete of cork and bitumen, thus making an elastic roadway. Mr. Page considered that if the heavy traffic were to pass along that roadway it would damage it. He, therefore, required that all heavy carriages should go upon the trams of iron which were laid along the two sides of the bridge. With reference to the other question he (Mr. Cowper) had no reason to doubt that the bridge would furnish safe accommodation for any traffic which might have to pass over it at any time. It was true a question had arisen as to whether the bridge was fitted to bear any vast load which might by possibility come upon it. Mr. Page had not, in fact, provided for such a load as other persons of high authority thought ought to be provided against. His (Mr. Cowper's) opinion was, that the bridge ought to be strengthened; but, at the same time, he had no reason to doubt that it would be strong enough to carry any amount of weight that would be brought upon it under ordinary circumstances. He should not like to have a dense crowd packed upon the bridge, nor would it be desirable to allow troops to march across it, but it was capable of bearing the ordinary traffic.

THE POST OFFICE.

WE need make no apology for wandering somewhat from our usual course in recording here some interesting information on the Post-office, given by Mr. Commissioner Hill at the Royal Institution on the 4th instant.

The ancients were destitute of any provision for the transmission of letters. German writers attribute the first formation of a post to the Huns Towns, and this method of communication was adopted by the Teutonic knights during their wars in Lithuania. But although letters were carried by the early posts, their chief object was the transmission of passengers and despatches. The next chief advance was the line of posts established by Maximilian through the Tyrol. Then Charles V.'s line from Vienna to Brussels. England, however, as late as the time of Henry VIII., had no established post, and letters were sent by messengers on foot or on horse. It was Charles I. who established, by proclamation, the Post-office Royal, appointing Mr. Thomas Wetherings as his postmaster. The loss incurred by the establishment was £3,400 a year, and yet the lines were few and far between. When the national troubles began the monopoly was questioned, but the Parliament, however, transferred it to themselves. Postmaster-General Pridaux, in 1642, improved and extended the system, and not only rendered it self-supporting, but even drew from it a profit. In the early part of the last century the Government were applied to permit the transmission of letters for Warwick direct, instead of through Coventry. But as letters then were charged by distance, the concession was refused, on the ground that the letters paid 3d., whereas they would only pay 2d. if permitted to go direct.

In 1683 Robert Murray, of London, established a post for the delivery of letters six or eight times each day near the Exchange, and four times in the outskirts of the metropolis, the Royal Post-office having made no provision whatever for London intercommunication. Afterwards this London delivery was joined to the Post-office. The lines up to 1784 were very few, when John Palmer, proprietor and manager of the theatres of Bath and Bristol, struck with the slowness in the post transmitted on horseback, which was outstripped by stage coaches, devised, with great skill, a variety of expedients for increasing the speed of postal communication. No sooner, however, had he revealed his plans than they were received with mingled feelings of disgust and amusement by the authorities, who stigmatised his scheme as impracticable. Fortunately, however, he had to do with a minister (the younger Pitt) "who trampled on impossibilities;" and to Palmer remains the glory of having removed innumerable obstructions. In 1784 the first mail-coach ran from London to Bristol. Two years after this, Palmer, when his plans were only in partial operation, had another struggle for their further adoption, and was defeated. But the ministry, although they gave up the inventor, kept the invention. From time to time, however, Palmer's claims were urged before Parliament by his son, and in the end £50,000 were awarded to him as compensation—a sum which at least acknowledged the right of the applicant. Some of the statements made in this discussion were amusing enough. "Mr. Draper objects to the mail-carts as travelling too fast; considers that passengers only going on business should travel at such a rate, namely, seven or eight miles an hour; before Palmer's time, the post travelled at three and a half miles an hour, which, in his opinion, left nothing to be desired."

Palmer also objected strongly to the constant robberies of the mail, and urged the economy of arresting such outrages. One prosecution alone cost £4,000. But the "guard" was objected to on the ground that "he would have to be waited for at every ale-house." Palmer found a net annual revenue of £150,000, and left the office in the receipt of £1,500,000; such were the effects of the speed and regularity infused into the department by his means. Macadam also, by his improvement in roads, aided much the improvement of postal communication. As the postboys had been outstripped by the mail-coaches, so after a time the Government mail again lagged behind the vehicles horsed by private enterprise, and the number of contraband letters sent by them became enormous. In one instance, 1,100 letters were seized in the warehouse of one of the London carriers, which, however, were liberated immediately on a fine of £500, on account of the injury which, it was alleged, would accrue to the commercial world by their detention, the stipulation being that they should be forwarded by the post of that night. From Palmer's day, however, although straitened by high rates, the Post-office remained a respected institution. In 1837, Mr. Rowland Hill, then Secretary to the Commissioners for the Affairs of South Australia, proposed his plan, that of conveying all letters under half an ounce for a penny, which hence has received the appropriate designation of "The Penny Postage." Hitherto all letters consisting of two pieces of paper, however small, had been charged with a double postage, and if treble or quadruple, so in proportion; and not only were letters thus assessed, but they were also charged variously in proportion to distance. Mr. Rowland Hill struck an average on the best data he could procure, and found that letters could be conveyed for that trifling sum. Both parties of the State alike regarded the scheme as not only extinguishing all profit, but as entailing a ruinous subsidy for its support. Not that Mr. Hill, however, left his plan without valuable supporting arguments and facts.

Previous to 1837, the Post-office had been the subject of investigation, and the result was a formidable pile of blue-books, of the information in which Mr. Rowland Hill availed himself to answer objections. The number of letters transmitted each year, however, was not known in the Post-office. Mr. Hill had first estimated them at 88½ millions, but being enabled to correct his data, had ultimately reduced the total to 79½ millions. The Postmaster-General returned them as from 42 to 43 millions, a number far too low, for the gross revenue being some £3,240,000, the average per letter therefore would be 1s. 1½d., a rate everybody knew to be obviously extravagant. In 1847, a committee was appointed to investigate Mr. Hill's plan, and the postmaster amended his return to 58 millions, again to 67 millions, and subsequently to 70 millions. The committee, after laborious scrutiny, brought the number to 77½ millions, and ultimately the Post-office admitted 76 millions, which number was finally adopted. The scheme of the penny postage was based on the understanding that there would be an ultimate loss to the revenue of £300,000 per annum, and the number of letters must be increased, according to the Postmaster-General, twelve fold—according to Mr. Hill five fold—to make up the deficit. The soundness of Mr. Hill's opinions have been verified by facts, and the complete success has exceeded the limits of the wildest aspirations. Mr. Hill laid great stress on diminishing the labour of the Post-office officials—first, by means of the uniformity of the rate of postage; and, secondly, by stamps for avoiding the collecting of the postage money. Under the old system the cost had to be registered on the letter. It had to be ascertained whether it was single or double, and as the senders of inclosures were commonly adepts at concealments, it had often to be held up before a lamp; and, lastly, if it

had to travel further than a certain distance the extra rate had to be added. Now, as letters rarely approach the half-ounce, the clerks have very seldom indeed to use the scale.

The principal item of expense to the Post-office was and is the house-to-house delivery. No one would have thought that the cost of conveying a letter from St. Martin's-le-Grand to Barnet or to Edinburgh would have been practically the same, and yet such is the case, the difference not amounting to 1-9th of a farthing. In 1840 the Act for the Penny Postage came into operation. In the country districts at that time it was a common thing to have to go four or five miles to the nearest post-office, and yet England was far better supplied than Wales, Scotland, or Ireland. In 1837 Mr. Hill suggested day mails. Before this letters passing through London, (say) from Liverpool to Dover, Brighton, and other places, were always kept waiting at St. Martin's-le-Grand for fourteen hours. Within the six-mile radius the number of deliveries per diem has been increased to eleven; and within the twelve miles' district there were, in some places, as many as six deliveries. Instead of all letters being sent out from St. Martin's-le-Grand, after having been transmitted there to be sorted, the metropolitan area has been divided into districts, each of which is treated as a separate postal town, and the letters of each district are received and delivered within its assigned limits. Much useless labour is thus got rid of, and accelerated despatch acquired. The lecturer then gave various details, instituting a comparison between the years 1839 and 1861, in matters of postage and in the money-order department, alluding also to the newly established savings-banks.

Of money-orders the total in 1839 was 198,000, amounting to £320,000. In 1861, 758,000, amounting to £14,616,000. The number of letters in 1839 was 76 millions; in 1861 it had swollen to the stupendous number of 593 millions! The average number of letters to each person in 1839 was, in England, 4; in Ireland, 1; in Scotland, 3. In 1861, in England, 24; in Ireland, 9; in Scotland, 10; giving a general average of 20 to each individual: thus showing the social advantage of the change. The weight of letters carried in 1839 was 758 tons. In 1861 it was 4,300 tons. The average daily mileage in 1839 did not exceed 54,000 miles. In 1861 it had risen to 149,000 miles, or six times the circumference of the globe. The officers employed in 1839 were about 8,000. In 1861 they were 25,473; in addition to which there was a large class of others engaged for a portion of time. The gross revenue in 1838 was £2,350,000. In 1861 it was upwards of 3½ millions, and the million and a half of net revenue of 1837, when Mr. Hill published his plan, stood restored! Such are some of the results of the Penny Postage. With correspondence still increasing, whether we be in peace or at war, each revolving year adds to the measure of success; and however rapid these strides, and the spread of the new system throughout the civilised world, the Post-office no longer regards itself as perfect, and suggestions for improvement are welcomed, not, as of old, frowned away.

THE EMBANKMENT OF THE THAMES.

ON the motion of Mr. Cowper the Select Committee on the Thames Embankment Bill has been nominated as follows: Mr. Cowper, Sir John Pakington, Sir M. Peto, Sir J. Shelley, Lord R. Montague, Sir J. Paxton, with five members to be added by the committee of selection.

A deputation from the vestry of the parish of Chelsea waited, by appointment, on the Chief Commissioner of Works, to urge upon him the desirability of having the embankment of the Thames continued from Westminster to Battersea-bridge, and the Low-level Sewer carried under it. It appeared from the statements of Mr. Tite, M.P., who introduced the deputation, and of Mr. Finch, that some years since Parliament voted a large sum of money for the embankment of the Thames at Chelsea, as an aid to local subscriptions for the same purpose, but that, as the latter were not forthcoming in the proportion stipulated for by the legislature, a sum of from £30,000 to £40,000 was paid back into the Exchequer. They thought if that sum were now placed at the disposal of the Metropolitan Board of Works it would enable them to continue the embankment of the river in connection with the Low-level Sewer from Westminster-bridge to Battersea-bridge, and so obviate the proposed discharge of the sewage of the neighbourhood into the Thames, after going through the process of decolorisation at Cremenore, as it was objectionable that any foreign matter should be allowed to find its way into the Thames. The construction of the works in question would, they urged, be a great improvement to the neighbourhood; and, as Battersea-bridge is a dangerous nuisance, they suggested that a new bridge connecting Oakley-street with a road right through Battersea-park, would, by bringing Clapham and that district into direct communication with the public institutions at Kensington, make the Government property productive.

The Chief Commissioner, in his reply, stated that in spirit he fully concurred in the views of the deputation, but he felt sure Parliament would not re-vote the money except upon the original condition that the neighbourhood itself should contribute towards the expense of the work; and with regard to the proposal for the erection of another bridge, it was not likely to be entertained, especially as the traffic over the one lately erected was not sufficient to pay a fair interest upon the cost of it.

Mr. Finch reminded the right hon. gentleman that Parliament had by a subsequent Act abandoned the principle that the vote of the House of Commons should be aided by local contributions. The parish of Chelsea would, if it had parliamentary powers to do so, willingly aid in the undertaking; but as the work would be a benefit to the public and a benefit to the Board of Works, it ought not to be delayed, but constitute part and parcel of the main scheme.

The Chief Commissioner fully agreed that the present was the time to move in the matter; but as the case of Chelsea differed from that of the Strand and Fleet-street, and had no excessive traffic of which to be relieved, he did not see how any portion of the coal dues could be applied to the work of embankment there.

At the weekly meeting of the City Sewers Commissioners, held on Tuesday, a report was brought up from the General Purposes Committee, stating that they had examined the Thames Embankment Bill (now before the select committee in the House of Commons for consideration), and in reference to such of its provisions as relate to the proposed new street from Blackfriars to the Mansion House, they had had their attention drawn by the surveyor to certain lateral streets connected therewith, and it had been suggested that endeavours should be made to obtain an improvement in each of the said lateral streets in the manner shown in plans which had been laid before them, and they were of opinion that it was desirable that the surveyor should be instructed to attend the Select Committee in the House of Commons to explain the same.

REMOVAL OF ST. THOMAS'S HOSPITAL AND THE CHARING-CROSS RAILWAY.

ON Tuesday a numerously-attended meeting of the governors of St. Thomas's Hospital was held in the large room of that institution, Sir JOHN MUSGROVE, Bart., in the chair, supported by the Right Hon. the Lord Mayor, the Earl of Leven, Mr. Tite, M.P., Sir J. Hennie, and others, to receive the report of the grand committee, which called the attention of the governors to the course that had been pursued with reference to a suitable site for the new hospital. The committee deemed it of primary importance to ascertain what quantity of land would be required to enable the governors to build a hospital on the most improved plan; and, after instituting many inquiries, and finding that the extent of the site of the new French Hospital—Hôpital de Lariboisière—supposed to be the best in existence, occupied from twelve to thirteen acres, exclusive of officers' residences, &c., and having in view the rapid increase of building within ten miles of London, the committee arrived at the conclusion that not less than from fifteen to eighteen acres ought to be secured for the proposed new hospital; and if practicable, even a larger quantity, in order, as far as possible, to prevent interference with the ventilation of the hospital by future building operations. Assuming it to be indispensable that the proposed site should be healthy as respects soil and elevation, and easily accessible to the afflicted poor, all the requisite information and statistics on those matters had been prepared and laid before the governors. The committee had not lost sight of the interests of the medical and surgical officers, or of the medical school; and where these interests were opposed to the more important interests of the poor, the former were considered subordinately to the latter, and it was the opinion of the committee that the interests of the medical officers of the school would be best served by placing the new hospital in a situation that should be found most conducive to the well-being of the patients. The committee had had under their consideration not fewer than forty-four sites, and the following nine were under consideration, viz., three at Camberwell (at Bushy-hill, Brunswick-square, and New-road respectively), two at Hatcham (the property of the Fishmongers' Company and Mr. Hardcastle, Kent-road, Ord.), Lewisham (Mr. Boyd), Walworth (Royal Surrey Gardens), and Walworth (Fishmongers' Company). The sites were not all equally eligible. The Brunswick-square, Camberwell, and Old Kent-road sites were, perhaps, the least eligible. All varied much in price, not merely as regarded first cost, but also as regarded the probable additional outlay in purchasing the surrounding buildings, to secure sufficient ventilation and suitable access. The committee, while submitting this statement, thought it right to remind the court of the effect which the selection of any particular site by the court would probably have in enhancing the price.

After considerable discussion on the points in the report, it was proposed by the CHAIRMAN, seconded by the Right Hon. the LORD MAYOR, and carried, that the report of the grand committee be referred back to them to continue their negotiations and inquiries as to the site and other arrangements for the new hospital and report thereon.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

At the meeting held on the 10th inst., Mr. JAMES B. WALTON, Vice-President, in the chair, Mr. FRANCIS CAMPIN, President, read a paper "On Single and Continuous Straight Girders."

After a few preliminary remarks upon the impulse given to the progress of bridge building, by the introduction of wrought iron as a material for that purpose, the author proceeded to explain a simple and practical method of proportioning the flanges of straight girders. The amount of strain upon any part of a straight girder might be calculated to the greater nicety by formulae deduced from mathematical investigations, which, however, are generally too complicated to be practically available.

The curve of strain upon a girder simply supported at each extremity is a parabolic segment which, however, may be closely approximated by a circular segment, hence the least area of any section of the flanges may be measured on the ordinates of a curve drawn as follows:—

Find the area at the centre of the girders, from which point lay off to scale at right angles to the girder an ordinate representing such area; then describe a circle, passing through the extremities of the ordinate and line of girder. It is desirable that the vertical scale of areas be as small as possible in proportion to the horizontal scale. The area of either flange

at the centre, including loss by rivets, may be found from the expression, $0.0313 \frac{wl^2}{d}$

where w = load in tons per foot run, l = space in feet, d = depth of feet, the result being the area in square inches.

One span of a continuous girder may be regarded as virtually divided into two or more parts, a central part acting as a girder supported at each end, and limited in length by the points of contra-flexure, which part may be treated exactly as any ordinary single girder, as described above, and one or two end parts, of which each acts as a girder, fixed at one end and free at the other, bearing a uniform load w per foot run, distributed over its length, and a concentrated load at its extremity, equal to half the total load on the central part of the girder. The area at the point of fixture being found for either flange from the

expression $\frac{Wx}{8d}$, where W = total load on half beam, and on central part, d =

depth of girder, x = distance of point of contra-flexure from point of support = length of half beam. All that remains to be determined is the value of x , which corresponds to a minimum area of the curve of strain.

The author then explained the process of finding x , which gives for a beam fixed at both ends $0.215l$, and for a beam fixed at one end and supported at the other $0.25l$.

In the case of a continuous girder, the values of the x 's are assumed first as equivalent to one of the above quantities, and then reduced to give an equality of area over the points of support, whichever span such area is calculated from.

The author then proceeded to find the actual saving from the use of continuous girders, and, from a calculation of numerous existent cases, found that it sometimes amounted to 25 per cent. of the weight, averaging about 18 per cent.

These results were obtained from an empirical formula, for the weight of metal in a

bridge, supposing single spans to be used, it is $\frac{10,000}{b \cdot l^{2.25}}$ giving the weight in tons, b = the

breadth, and l = the span, both in feet, the quantity 2.25 being found from the expression,—

$$n = \frac{\log l - \log l'}{\log w - \log w' + \log b' - \log b}$$

in which w, b, l, w', b', l' , are the weights, breadths and spans for two cases, $n = 2.25$ was the mean result of a number of solutions of the above equations.

MANCHESTER CATHEDRAL.—Among other bequests of the late Mr. George Faulkner is one of £8,000, for restoring Manchester Cathedral. The cost of its restoration was some time ago estimated at £10,000, and about £2,000 has been raised by subscriptions.

Reviews.

Chambers's Social Science Tracts. W. and R. Chambers, London and Edinburgh.

WE have received the fifth number of this manual for the working classes. Its subject is Building Societies, and it contains at length a lecture delivered before the Architectural Institute of Scotland, by Mr. W. Chambers, of which we gave a condensed report at page 241 of our present volume.

The Messrs. Chambers are always working in the right direction.

Canada: a brief Outline of her Geographical Position, Productions, Climate, Capabilities, Educational and Municipal Institutions, Fisheries, Railroads, &c., &c., &c. Fourth edition.

THIS pamphlet, issued from the Bureau of Agriculture at Quebec, is intended for circulation "in the hope that Canada, as a distinct and important portion of North America, may thus become better known." It gives detailed and valuable information as to the position and extent of Canada, its natural advantages, resources, minerals, fisheries, government, population, laws, municipal and educational institutions, religion, soil, value of land, free grants, land regulations, the condition and prospects of the new settlements, climate, routes through the province, trade and revenues, wage, outfit, railways, protection to emigrants, &c., &c.

Persons intending to emigrate should possess this pamphlet, together with one For the Information of Emigrants, dated from the Government Emigration Office at Quebec.

A List of the Principal Newspapers Published in the United States and Canada. Gun and Co., American Agency, and the Reading Room, 10, Strand.

IS neatly printed, in a convenient form, and is so far observed very complete.

Mitchell's Screw Piles and Moorings, with Johnson's Patented Improvements, and their Applications. By FREDERICK JOHNSON, C.E.

THIS pamphlet gives a brief outline of the principle of the screw pile, and an account of some recent improvements in its form, together with instances of its application in the construction of lighthouses, beacons, piers, and jetties, bridges, viaducts, &c., including the Portland Breakwater. The form of the screw is shown by a woodcut.

The Ecclesiologist.

OUR contemporary in the April Number gives a view of "Karileph's Church"—i.e. Durham Cathedral as erected by Bishop Karileph. The paper accompanying the view was read by Mr. Robson, before the Yorkshire Architectural Society. There are also two plates containing a plan, sections, and details of Deerhurst Church, Gloucestershire, with a history of the church. "Foreign Gleanings" notes, among other works, the restoration of the west end of St. Peter's, Louvain, doings at Maestrecht, Aix-la-Chapelle, and other places. We have already given an article on the Medieval Court at the Great Exhibition.

The Art World.

WE have received the first part of this new periodical, which we notice in its second Number makes "common cause with the Art Journal" in its late unwarrantable attack on the Building News and Builder, with reference to the International Exhibition building. The new journal pompously says, "In the silence (!) of the architectural journals the art journals must speak out;" nor are we better pleased by observing in the sixth Number a criticism of the Architectural Exhibition, which is, with the exception of three lines, simply a reprint, in large type, and without acknowledgment, of what has already appeared in our pages.

Architectural Sketches: Ecclesiastical, Secular, and Domestic, in Worcestershire and its Borders, with Historical and Descriptive Notes. By J. SEVERN WALKER, hon. secretary to the Worcester Diocesan Architectural Society. Vol. I. Worcester: Deighton and Son. London: Masters and Co.

THE objects and scope of Mr. Walker's "Sketches" is briefly to make better known the architecture of Worcestershire, which, as he remarks, is but little known in comparison with that of others. New and restored churches, parsonages, schools, and labourers' cottages, will be given, together with facsimiles of scarce old prints and drawings, representing buildings now destroyed or modernised. The historical notes will be compiled, but the author will hold himself alone responsible for the architectural descriptions and remarks, which we have little doubt will be prepared with great care. The present volume contains, executed by the anastatic process, and it must be remarked, not with equal success, illustrations of St. John's Church, at Hagley; St. Michael's, and "The Lodge," at Elmley Lovett, the latter one of the last half-timbered structures remaining in the county; an elevation of a portion of the chancel screen, St. Mary and All Saints, Hampton Lovett; Old Bewdley Bridge; St. Kenelm's Church, Clifton-upon-Teme; Homme Castle and Woodmanton, both at the same place; sketches from Knightwick and Dodenhall; White Ladies Aston Church; St. Michael's, Crofton-Hackett; Beauchamp Lodge, a half-timbered structure erected in 1850, and Roadway Hill Cottage, both at Highnam Court, which, by the way, is in Gloucestershire.

We may hope that Mr. Walker will be encouraged to continue his work to some length; no doubt a few shortcomings as regards the illustrations will not be observable in future volumes.

Correspondence.

JOINERS' WORK IN LONDON AND LANCASHIRE.

SEN.—In the Review of last Saturday the following occurs:—
"A COSMOPOLITAN.—The important letter of a foreman builder upon 'Joiners' Work in London and Lancashire' will positively appear in our next number."
As that might lead you to believe that I had addressed my letter to the editor of that paper, I write to inform you that I have not done so.
April 14th, 1862.

A COSMOPOLITAN.

DECISIONS IN THE COURTS.

ARCHITECTS' RESPONSIBILITIES.*

Louch v. Crawford; Crawford v. Louch.—*Londonerry Assizes.*—These cases involved, in the first instance, a claim by an architect, Mr. Fitzgibbon Louch, of Derry, for £262 11s. for professional services, and in the latter a contra demand by executor of the deceased client for damages sustained to a property by reason of an alleged mistake committed in the laying out of some recently erected houses thereon.

It appeared from the examination of Mr. Fitzgibbon Louch that he is an architect, resident in Derry for the last five or six years; had conversation in latter end of 1859 with the late Mr. Crawford about building; Mr. Crawford asked plaintiff's opinion as to the best mode of laying out a square; he had plans previously from Mr. Tait, of Edinburgh, and Mr. E. W. Godwin, architect; Mr. Crawford said plaintiff's ideas met his views best; asked his charges; plaintiff told him the same; Mr. Crawford requested plaintiff to commit them to writing (letter of plaintiff, dated 4th November, 1859, stating same, produced). Objected to by defendant's counsel as not being evidence, it not having been signed). Plaintiff made survey of field (map produced); defendant gave great attention to the proposed works; plaintiff was engaged two days in surveying and levelling, a long time in making maps, in all matters seventeen weeks, during which he gave daily attendance, laid off ground in building lots, checked time and payments, excavations going on; plaintiff superintending same and other works during eighteen months (plaintiff detailed the nature of the works referred to); plaintiff was there by the late Mr. Crawford's directions; values services during seventeen weeks at £30; survey at £6 6s. extra; design for laying out a square, £30; staked out thirty-four lots valued in previous item; fourteen attendances on parties about to take lots charged 10s. 6d. each; total, £77s. In June, 1860, was called on by the late Mr. Crawford to design eleven of sixteen houses for north side of square (an elaborate drawing and coloured tracing of same produced); charged thirty guineas; believes same to be reasonable. In October, in same year, received instructions to prepare working drawings for four houses of the terrace; same since erected; gave detailed specifications to Mr. Crawford for carpentry and stonecutter's work (drawings produced); estimated cost, £3,200; fees on same, 2½ per cent., viz., £80, the usual professional charge. Defendant was so satisfied with work that he stated plaintiff had saved him £200; resolved to carry on work by sub-contract; plaintiff would charge £5 per cent. for the extra trouble, and defendant contracted to pay same; plaintiff superintended erection, commenced in January, 1861; late Mr. Crawford died in May, 1861, and continued to superintend until that date, when plaintiff was superseded by the executor and defendant; about £600 had been expended; remuneration for same, £30; claims 2½ per cent. on what was not expended. (Claim for £300 for damages sustained by reason of dismissal withdrawn). The late Mr. Crawford was almost daily in attendance at the work in company with plaintiff; the foreman, Patrick Connor, was selected by Mr. Crawford, but was objected to by plaintiff as not competent for first-class work; plaintiff required a good carpenter, and would not be accountable for Connor's acts; still Connor was retained; plans set forth the proposed range of the houses; plaintiff staked out front line of houses, also the intersection, the rear walls, and stable lane; told foreman that the front line of stakes was front of houses; directed him to excavate, which took a considerable period; average depth, 9 feet; stones and rubbish accumulated, could not, therefore, sight stakes with facility; commenced in January, 1861; discovered on 8th or 10th of April, in consequence of observations by a Mr. Burgess, solicitor, about depth at rear, that a mistake had been made; plaintiff said it was 70 feet; went there with his pupil, Mr. Irwin; discovered the houses had been set back 10 feet, and were not on the line of stakes; Connor was there; plaintiff was very angry; Connor said he thought the line of stakes represented line of area; breadth of stable lane designed 17 feet 6 inches; depth from front to rear, 100 feet; depth of houses, 38 feet; areas, 10 feet; yard, 14 feet; an average of about 4 feet of building work was executed in two houses and none in the other two when mistake was discovered; to remedy mistake at that time would not have cost £51. Plaintiff communicated next day the occurrence to late Mr. Crawford how foreman (Connor) had made the mistake; Mr. Crawford accompanied plaintiff, who pointed out mistake, and insisted wall should be removed; Connor not present; Mr. Crawford asked could it be remedied; plaintiff recommended him either to remove the work, or to leave areas 5 feet wider, as in consequence of excavation he had to put two steps on pathway, and the additional width suggested would obviate that; Mr. Crawford said widen the area 5 feet, and reduce the lane from 16 feet 9 inches to 14 feet; he having examined several stable lanes, and found that width sufficient, Mr. Crawford remarked that his meaning was in centre of gripe, and directed works to proceed, as he would have no difficulty in getting the customary 6 feet allowed him at other side of quick if he built a wall; after said interview, and up to the time of his death, Mr. Crawford visited works frequently; basements of the other two houses were built in conformity with altered plan, to Mr. Crawford's knowledge, who never found fault; Mr. Crawford directed Connor to build area wall; another mistake made by Connor, who left out fire-places. Returning to items in account, plaintiff, in answer, stated he let some of the premises by Mr. Crawford's directions, and claims £2 2s. for same, as agreed. (Other items admitted by defendant's counsel.) Plaintiff received no money whatever, except £23 18s. 1d., in respect of account furnished; used skill to best advantage; produced copy of specification; original given to Mr. Crawford; offered to prepare duplicate when latter got mislaid, but defendant refused access to plans; heard for first time of complaint about 27th September, 1861.

Cross-examination—First business acquaintance with Mr. Crawford was in July, 1859, about survey of Gobaicale property; was paid for that to November following. (Plaintiff here explained items about Castlerock House, and produced drawings and specifications.) Estimated outlay, £400; next the business in hands—viz., Crawford-square; charged £107; per centage is not the scale adopted in such works; plaintiff employed Mr. Milne, a landscape gardener, in April, 1860; Mr. Milne never complained of plaintiff's interference; plaintiff put him away; did not bring him back (letter of Milne here produced undertaking the carrying out of plaintiff's plan as foreman as long as he should continue to employ him); Milne went away in August; plaintiff or his brother certified for his weekly payments during most of that period; accounts at other dates not certified, but may have ordered payment of them personally after examining and noting them; believes the amount expended was about £300; estimates about three weeks' work for a draughtsman in making general elevation and tracing; the four houses built, and for which separate drawings are provided and charged for, are shown on that drawing; plaintiff has been paid 7½ per cent. on outlay when he had to superintend work without a contractor, the additional 2½ being added for additional trouble so incurred; furnished details, some on boards full size, as customary, others, such as trimmings, &c., fully detailed in specification; told Mr. A. Crawford, son of defendant, he had no "complete" copy of specification, but would furnish one if allowed the drawings; plaintiff furnished plans of four houses for working purposes; Connor was employed to superintend the works; Mr. Crawford reproved him for taking too much authority (plaintiff again explained the manner he had driven the stakes; was on ground every day, but owing to the heaps of stones could not see clearly the front line: if he struck out the line properly would expect the foreman to see the line preserved; did not say to Connor "to say nothing about it, that he (plaintiff) would make it all right;" the additional width of 5 feet was given to area, and Mr. Crawford admitted to plaintiff that he considered it a great improvement (map of property produced); map has been altered, but was right before erasures; by scale the dimension 33 feet 3 inches ought to be 34 feet 9 inches, but figures are attended to in preference; was altered in his office, but not by his directions, to make it correspond with the ground; swears positively alterations were not made to blind Mr. Crawford, but to show the houses thrown back 10 feet, and the lane reduced; trench sunk inside foundation in a couple of days.

W. J. Barre—Resides in Belfast; is an architect of ten or eleven years' experience; knows premises in question; heard plaintiff's evidence as to charges; made estimate as to what would be reasonable fees for the services rendered; charges according to time and labour for expenditure under £500 (here explained minimum charges for the various items in the account); gross amount, with reference to the surveys, maps, superintendence of roads, £57 15s.; general elevation of north side £20, taking the drawings on their own merits, and disconnected from the other works; deducted therefrom a proportion of one-fourth for the drawings, as would form basis for a contract, all details included, subsequently fur-

nished for the four houses, and for which plaintiff is entitled to 2½ per cent., or £30 to £32 10; also if plaintiff was required to render the services stated by him, and which were over and above those usually required, £5 per cent. is reasonable for superintendence alone.

Cross-examination—Heard plaintiff speak about seventeen weeks' time expended, and estimated one item accordingly; if not so employed would certainly reduce it; cannot speak as to house agency fees, but would not allow his time to be frittered away without payment if required to give information about lots, &c.; heard plaintiff's statement as to details; does not think his proceeding correct; seeing the way the houses are executed, there must have been either total ignorance on part of foreman, or drawings are wanting; there should be details for various portions, they might have been furnished; wanting these, should deduct £10 from the £30 allowed, and if no specification, would value the charges at 1½ instead of at 2½ per cent.; thinks it possible an architect might not observe the mistake, and still be doing his duty, as he would naturally assume that the man in constant attendance would not deviate from the line of stakes fixed by him; if the stakes were before his eye, cannot conceive why they were not discovered; it was the duty of plaintiff to stake out main building, and the foreman should follow the drawings afterwards; if he received 7½ per cent., would consider it his duty to pay extra attention.

Re-examined—Would not consider himself responsible for the mistake under the circumstances as regards the foreman, enumerated by plaintiff; it showed extreme care on part of plaintiff to stake off other walls besides the front wall; where back line was also staked, cannot conceive how mistake arose; no man that understood his business could have made the mistake that Connor did; wondered that plaintiff had anything to do with such a foreman; believes plaintiff should not be responsible for the act of an incompetent party.

(Plaintiff's and defendant's counsel here agreed to shorten the case by not producing more than one professional witness on either side, plaintiff consenting to withdraw Mr. Williamson, C.E., county surveyor; Mr. J. J. Lyons (proprietor and editor of the *Dublin Builder*); and Mr. J. G. Ferguson, of Derry, architects; and defendant, Mr. Sweeney, C.E., and Mr. Boyd, of Belfast, architect.

Counsel then opened defendant's case, and dwelt on the exaggerated charges made by plaintiff, also on the damage sustained by the property by reason of the deviation, and which defendant claimed to be at the rate of some £7 per house for the sixteen houses designed and commenced.

J. McCurdy (examined)—Is an architect; examined account furnished by plaintiff; would allow two days for surveying—viz., £6 6s. for map; and for design for laying out the square, £10 10s.; for remainder of works, such as superintending road-making, &c., 2½ per cent. on the expenditure of £300—viz., £7 10s.; map for lithograph, £3 3s.; could not give an opinion as to the attendances, thinks it more house agent's duty than an architect's; as to charge of seventeen weeks, does not think time should be computed; for general elevation of north side allows £10 10s.; 2½ per cent. is proper remuneration for drawings, including details, but without them 1½ per cent., as two of each class of house are duplicates; for superintendence alone 5 per cent. is not proper charge under any circumstances, but the total, including supply of plans also; heard of the mistake, and confesses he would feel himself responsible for it were he employed; considers that with the contracted rear a loss of about £7 per annum at twelve years' purchase is incurred for each house of the range; land could only be about 6 feet wide, or a narrow lane; increased width of area is £55 6s. extra cost for the four houses; arch, sustaining steps and landing, has become more slender, owing to being elongated.

Cross-examined—It is not usual business of an architect to lay out grounds, superintend construction of roads, &c.; thinks 2½ per cent. is legitimate charge for such works; did not see the ground before the works were executed; understood that excavations had been made; does not consider plaintiff, as an architect, would be entitled to as much as Milne, the landscape gardener; if it took plaintiff a time one day in the week for 17 weeks, would give him three guineas per week; would say that he is only entitled to the usual superintendence fee if he went there twenty times a day; does know cases where architects were paid by per centage on such works; was paid himself £7 10s. for half an hour each week for three months; if no contractor, plaintiff should have made special arrangement, or should get a guinea each time he inspected, in addition to 2½ per cent.; if acting as foreman, would strike off 2½ per cent. and give him salary of two guineas per week; cannot combine the two characters of architect and clerk of the works; would not express opinion as to charges for attendances; plaintiff was acting professionally in staking front wall; thinks he (witness) would have discovered the error of the ground being thrown back 10 feet; would dislike the steps projecting in front; thinks areas too wide; would not leave upper landing so wide; the arches seem to be shaky; counted excavation in estimate of increased expense of constructing areas (quantities, measured and priced by Mr. Boyd, and checked by witness, were here produced); would have rectified the mistake if permitted; if not, would leave as it was.

John Milne (examined)—Is a landscape gardener; laid out cemetery in Derry; also Crawford-square; plaintiff spoke to him in April, 1860, and said he (plaintiff) wanted to know his charges; agreed to lay out the grounds according to a tracing; got no sections or levels; put up fence and hedge, drained the ground &c.; was paid by Mr. Crawford £2 2s. per week, whether men were working or not; plaintiff had nothing to do with laying out grounds; never complained to Mr. Crawford about plaintiff; gave up the work because he considered he was insulted by plaintiff; went back and finished his work; some pay bills are certified by plaintiff and some are not, as witness went direct to Mr. Crawford; was not under plaintiff's control; laid out the roads, took levels, &c., himself.

Cross-examined—Was there 17 weeks; not as good a job as elsewhere; laid out central square and roads; executed drainage and planting; plaintiff said something he did not like; left him of own accord; was absent at flower-show at Enniskillen; plaintiff gave him instructions as to breadth of roads; never said plaintiff turned him away for being drunk; no man ever saw him so; witness, not plaintiff, kept the time of the men.

Patrick Connor (examined)—Commenced employment at Crawford-square in January, 1861, as foreman mason, for Mr. Crawford; his duty was to take charge of the men and the work; received plans from the architect, Mr. Louch; worked under his directions; wages 26s. per week; Mr. Crawford found materials; plaintiff proceeded to mark out excavations; brought three flag poles; measured from hedge to flag pole; drove down the stakes part of the way; plaintiff directed him to keep 8 feet 10 inches from staked line for front wall; no other stakes laid down; plaintiff did not order to excavate 10 feet outside line; nothing to prevent stakes from being seen; Mr. Burgess was the first person that saw mistake; he remarked narrowness at rear; witness said he thought it was all right; had all cuttings finished before he got a plan; plaintiff came up same evening, and Mr. Burgess spoke of space behind; measured it, and found he (plaintiff) made a mistake; asked witness to say nothing about it, but to add 4 feet to area; Mr. Crawford had not been there; saw Mr. Crawford in two or three days afterwards; on 3rd May, before error was discovered, the walls of all four houses were 6 feet above level of bottom of foundation; would take fifteen masons a month to rebuild; was present when Mr. Crawford had conversation with plaintiff; plaintiff told him he was cutting away hedge, and Dr. O'agan prevented him; nothing said about mistake; Mr. Crawford was only twice on the ground after that; made no remark.

Cross-examined.—Has been long in late Mr. Crawford's service; knew about mistake in week ending 3rd May; did not draw Mr. Crawford's attention to mistake, as plaintiff is a brother mason—(laughter); knows Mr. Irwin; he was not there; his evidence was false; not a stone laid on 10th April; false that plaintiff and Irwin went together at the time named; made no excuse in Irwin's presence for the mistake; had been engaged with stake line before; different architects have different systems; did not know that the stakes marked front wall, but understood it, as expressed by plaintiff, to mean the areas; had not seen plan at that time; saw grounds staked out before; at barracks, under Board of Ordnance; knew about building works and stake line, and if plaintiff had said nothing, would have known it represented line of house; began to excavate in January; no row of stakes or lookspits for the whole sixteen houses; only part—half the distance; they were there a couple of months; not there now; area line had to be extended out 4 feet beyond the pegs; houses stopped in June; about £200 expended to that period, exclusive of excavation.

After a short deliberation the jury found a verdict of one fourth damages in each case, which leaves each party in the same position as he commenced, excepting the costs, to be equally borne, and which are heavy.

* Reprinted from the *Dublin Builder*.

THE PRINCE CONSORT MEMORIAL.

THE committee engaged in raising a fund for a national memorial of the Prince Consort held a meeting at the Mansion-house on Wednesday. It was stated that the fund, up to that day, amounted in the aggregate to about £45,800, of which upwards of £1,000 had been received within the past week alone.

The LORD MAYOR, in reply to a question by Mr. Gregson, said, of late doubts had been entertained whether the block of granite in the quarry belonging to the Duke of Argyll in the Island of Mull, upon which the attention of Her Majesty's Committee of Advice had for some time been concentrated, would answer as to grandeur the purpose of a monolithic obelisk in perpetuating the Prince's memory. Drawings of the stone, carefully prepared, had recently been laid before the committee by the chairman of the Mull Granite Company, from which it appeared that, although it was about 115 feet in length, yet it undulated in places very considerably, so much so that, when lines came to be drawn along it, making allowance for the necessary form of an obelisk, some of those indentations were within the lines, thus detracting from its aptitude for the purpose in view. The company had been at some expense in uncovering it as it lay, and although, perhaps, its precise character and dimensions could only be satisfactorily ascertained by degrees in the process of quarrying, still the defects in its breadth in places to which he had alluded had induced the committee to pause before incurring greater expense in a work which might, after all, prove abortive. The Lord Mayor added he was afraid the great mass of the people of this country had yet to be educated, so to speak, into a thorough appreciation of the grandeur and appropriateness of the obelisk, and especially a monolithic obelisk, for monumental purposes. There were some who appeared to regard the setting up a huge stone for such a purpose as simply symbolical of a barbarous age. With great respect for the opinions of others, he could not help saying he altogether dissented from such reasoning. Besides, it was not until the Egyptians had reached the highest point in their cultivation of art that obelisks became conspicuous features in their style of architecture; and he thought it would have been a glorious thing for England, where a monolithic obelisk worthy the name was utterly unknown, to have made this the occasion for erecting one of imposing grandeur.

TENDERS.

BATH STONE OF BEST QUALITY.—Randell and Saunders, quarrymen and stone merchants, Bath. List of prices at the quarries and depots, also cost for transit to any part of the United Kingdom, furnished on application to Bath Stone Office, Corsham, Wilts.

IRONWORKS, BEDFORD.

For the enlargement of the Britannia Iron Works, Bedford. Plans by R. Palgrave, Esq., of Pall-mall, London.

Charles Day	£1,850 0 0	James Francis and Son	£1,649 6 0
William Freshwater	1,825 0 0	John Conquest (accepted)	1,528 7 4
Georga Bryant	1,741 19 0		

SCHOOLS, MANCHESTER.

For the new Catholic schools, at Greengate, Manchester. E. Welby Pugin, architect. Quantities supplied by Mr. S. Marples.

Mr. Eaton's 1st tender	£2,390	Mr. Simpson	£1,754
do. 2nd tender	2,045	Mr. Farrell	1,713
Mr. Heringham	1,900		

DWELLING HOUSE, LINCOLN.

For rebuilding a house on Metheringham Heath, Lincoln, for James Greenham, Esq. Mr. Goddard, architect, Lincoln.

Pattinson	£1,525 5 0	Bavin	£1,248 0 0

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post*. Gold watches, 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enable persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 & 34, Ludgate-hill, 46 & 47, Cornhill, London, E.C. Established 1749.

COMPETITIONS OPEN.

CLOCK TOWER.

HASTINGS.—The Prince Consort Memorial Committee appointed to carry out the above object at Hastings invite architects and others to submit designs for the same. The sum of £10 10s. will be paid for the design approved of by the Committee, which design will then become the property of the Committee. Particulars from Robert Growse, town clerk, High-street, Hastings, to whom designs must be delivered before the 1st May.

CEMETERY WORKS.

CHELTENHAM.—The Burial Board for the borough of Cheltenham require plans, estimates, and general specifications, for the laying out, constructing roads and footpaths, erecting buildings on, fencing in and planting, certain lands purchased by them for a cemetery, the superficial area of which is eighteen acres. The designs must include a ground-plan, showing the sites of the different buildings required, the courses of the carriage-roads and walks, the courses, also, of the drains, the division of the land into the several sectional burial-places, and the subdivision of such places into plots for burial. The plan, also, should show the manner proposed for the ornamental planting of the land. Should the intentions of the designers as to the laying out of the land render it necessary, sections of the earthwork required, and formation of the ground surface as proposed to be made, should be provided, and such other details and suggestions as the competitors may think necessary to illustrate and make clear their designs. Plans, elevations, and sections must be provided for two chapels, dead-house, lodge, gates, and walls at entrances, &c. Specifications must accompany the plans, describing the manner of construction, the class and substance of material in the several buildings, and estimates of their several costs. Plans, specifications, and estimates of the manner of laying out and planting the site, of forming and making the roads and footpaths, and of the character and cost of fencing the site, to be also provided. Plans, &c., may be either for forming and finishing the roads and footpaths, laying out and planting the site, or for fencing the site, or for the chapels and other buildings before mentioned, and the entrance-walls and gates, or the whole of the works, may be combined in the plans, &c., of any competitor; but the Board reserve the right of selection at their discretion from the plans, &c., submitted to them. A premium of forty guineas will be given for the best designs, specifications, and estimates for the whole of the works sent in; and a premium of twenty guineas for the second-best designs, specifications, and estimates for the whole of the works. Should designs, &c., be selected for part of the works only, a fair arrangement as to the premium will be made by the Board, with the successful competitors. The plans, &c., selected to become the property of the Board. The plans, &c., are to be distinguished by a mark or motto, and accompanying them a sealed envelope, having the same mark or motto outside, and within the name and address of the designer, and the terms on which he will superintend and supply his professional services in execution of the works. Plans and particulars of the land may be had of Mr. Henry Dangerfield, borough surveyor. The plans and other documents to be sent to G. E. Williams, clerk to the Board, Public Offices, Cheltenham, on or before the 29th May.

SCHOOLS, &c.

DURHAM.—Plans and elevations are wanted for [schools and teachers' residences, in conformity with the rules of the Committee of Council on Education, at Stockton-on-Tees, Durham. The boys' school to accommodate 250; the girls' school, 200; and the infants' school, 200. Three teachers' residences. Ten pounds will be given for the most approved set of plans. Further information and tracing of site may be obtained of William Skinner, Esq., Stockton-on-Tees, to whom plans, with estimates of costs, must be sent, not later than the 30th April.

LIBRARY AND READING ROOMS.

BIRMINGHAM.—The Free Libraries' Committee of the Council of the Borough require plans, sections, specifications, and estimates for the erection of a free reference library and reading-rooms, lending-library and news-room, and gallery of art, upon the piece of vacant land adjoining the Midland Institute Building, with an elevation uniform with the said building. Intending competitors are requested to send in their plans, specifications, and estimates, under cover to Thomas Standbridge, town clerk, Town clerk's office, Temple-street, endorsed "Plans for Free Reference Library Buildings," on or before the 16th June. Particulars of the accommodation required, and of the conditions of competition, together with a lithographed plan of the site, may be obtained on application.

CHAPEL.

LEICESTER.—A premium of ten guineas is offered for the best design for a Wesleyan chapel, to be built in Leicester, capable of holding 900 persons. Architects wishing to compete may, upon application to Mr. H. Wale, 56, New-walk, Leicester, receive a plan of the site, and instructions and any other information required. The plans to be forwarded, carriage free, addressed to Mr. H. Wale, on or before the 1st May, accompanied with a sealed envelope, containing the architect's name, and bearing a motto corresponding with one to be placed on his design.

CONTRACTS OPEN:

CLUB HOUSE.

DUBLIN.—For intended alterations and additions to the Stephen's-green Club House according to plans and specifications prepared by John S. Butler, Esq., architect. To be inspected at his office, No. 16, Hume-street, Dublin, up to the 23rd of April, on which day proposals are to be furnished.

ASSEMBLY ROOMS.

STAFFORDSHIRE.—For the erection of the Silverdale Assembly-rooms. Drawings, &c., at the Silverdale offices, Newcastle-under-Lyne, size of room 60 feet by 38 feet. Tenders post-paid, to the secretary, on or before the 21st April, 1862, sealed and endorsed "Tender for Assembly-room."

QUAY.

ROCHESTER.—For the erection for the Corporation of Rochester, of a town-quay and landing-place, at the said city of Rochester. Drawings, &c., at the office of Mr. Henry Andrews, surveyor, Rochester. A bill of quantities of the proposed work can be had of the surveyor on payment of fee of 10s. 6d. Tenders to be sent to the offices of Richard Prall, jun., town clerk, High street, Rochester, not later than twelve, noon, on the 30th April instant, sealed and directed to the Mayor, Aldermen, and citizens of the city of Rochester, and endorsed "Tender for erection of Town-quay and landing-place."

WORKHOUSES.

LONDON.—For the erection of imbecile wards, at the workhouse establishment, Mile-end Old-town. Drawings, &c., at the office of Mr. Dobson, architect, 20, Mile-end-road, E. A bill of quantities may be had upon payment of 20s. Tenders endorsed "Imbecile Wards," to E. J. Southwell, clerk, Workhouse, Bancroft-road, Mile-end, N.E., before 1, on Thursday, 24th April.

YORKSHIRE.—For the erection of a new union workhouse, at Wetherby, in the county of York. Drawings, &c., with James Coates, jun. clerk to the Board of Guardians of the Wetherby Union, until the 28th inst. Tenders sealed, endorsed "Tender," and addressed to Mr. Coates, will be received on or before the 28th inst.

OFFICES.

LIMEHOUSE.—For the erection of new offices and board-room, in White Horse-street, Commercial-road East, for the District Board of Works. Drawings, &c., upon application to Mr. Charles Dunch, architect, White Horse-street, Commercial-road East. Tenders are to be delivered at the offices of the Board not later than 12 o'clock on the 5th day of May.

DARLINGTON.—For the erection of Darlington new market, town offices, and clock tower. Plans, &c., with George Dickinson, C.E., Surveyor to the Board, Central-buildings, Darlington, or at the office of Mr. Alfred Waterhouse, architect, Mount-street, Manchester. Tenders to Mr. Dickinson, endorsed "Tender for Darlington Market, &c.," and addressed to the Chairman of the Darlington Local Board of Health, on or before 5th May.

CHURCHES.

MONTGOMERYSHIRE.—For the erection of a new church at Bwlch-y-Ciban, in the parish of Meifod, Montgomeryshire. Plans, &c., on application at the schoolhouse, Bwlch-y-Ciban,

six miles from the Llanymynech station, and nine miles from Welshpool. Further particulars by applying to the architect, G. G. Scott, Esq., 20, Spring-gardens, London. Tenders to be sent in on or before the 22nd April, addressed to the Rev. R. Wynne Edwards, Meifod Vicarage, Welshpool, and endorsed "Building Tender."

BERKS.—For restoring and part rebuilding the parish church of Wokingham, Berks (where there is a junction station of branches of the South Eastern and South-Western Railways). Plans, &c., at the office of Mr. W. W. Wheeler, solicitor, Wokingham, till the 13th. Sealed tenders directed to Mr. Wheeler, on or before the 29th inst.

LANCASHIRE.—For the several works to be done in the erection of St. Saviour's Church, Bacup, Lancashire, of which the foundations are just completed. Plans on application to Mr. Robert Howarth, at Stubbylee, Bacup. Tenders, either for the whole works or for the several portions, must be delivered to Edward Wyndham Tarn, architect, Huddersfield, at Stubbylee, before one p.m. on the 23rd inst.

SCHOOL.

EXETER.—For the erection of Wesleyan school premises, in King-street, Exeter. Drawings, &c., with W. Blackmore, architect and surveyor, 3, Maunsell-terrace, St. David's, Exeter, until the 21st inst., on which day before six p.m., sealed tenders are to be delivered, endorsed "Tender for School."

DWELLING HOUSES, &c.

CHIPPING NORTON.—For alterations and very considerable additions to a residence at Chipping Norton. Plans, &c., at the offices of Messrs. Gibbs, Thompson, and Colbourne, architects, Stratford-upon-Avon, until the 23rd inst., where the quantities, &c., may be had on payment of 10s. Tenders to Messrs. Tilsley and Wilkins, Chipping Norton, on the 23rd April.

KING'S LYNN.—For the erection of three first-class, four second-class, and four third-class houses, at Hunstanton, according to plans, &c., by Mr. Butterfield. The plans, &c., may be seen at the office of Mr. J. S. Valentine, C.E., 17, Parliament-street, Westminster, or with Partridge and Edwards, solicitors to the Hunstanton Building Association, King's Lynn; or copies may be forwarded on prepayment of 21s. Tenders, stating a separate amount for each class of house (marked "Tenders for Building at Hunstanton") to be delivered to the solicitors on or before the 23rd inst.

GLoucestershire.—For the erection and completion of a villa residence, with stable and coach-house, proposed to be built near Stroud, Gloucestershire. Drawings, &c., at the offices of Messrs. Franklin and Clissold, architects, Stroud. Tenders to be delivered to Messrs. Franklin and Clissold, on or before the 28th inst.

FARM BUILDINGS.

BURTON-ON-TRENT.—For alterations and additions to farm-buildings on the estate of Sir Henry De Vaux, bart., near Burton-on-Trent. Plans, &c., on application to the tenant, Mr. Winnall, Calves Craft Farm, Roslinton, near Burton-on-Trent. Sealed tender must be delivered to Messrs. J. and J. Girdwood, farm architects, 49, Pall-mall, London, F on or before April 26th.

POLICE STATION.

DEVON.—For the erection of a police station, &c., at Holsworthy, Devonshire. Plans, &c., with Henry Ford, clerk of the Peace, Castle of Exeter, and at the office of Mr. A. Coham, Clerk to Justices, Holsworthy. Sealed tenders, endorsed "Tender for Holsworthy Police Station," to be sent to Mr. Ford, on or before the 29th April.

RIVER WORKS.

CAMBRIDGE.—For the repair of the walls of Baltsbite Sluice (about three miles below Cambridge), and for supplying the same with new oak doors and floodgates for the Sluice Pen; new bridges over the floodgates and overfall, and other works. Specification with Clement Francis, Clerk of the Conservators, Cambridge. Sealed tenders to Mr. Francis, on or before the 30th inst.

ROADWORK.

CHIPPENHAM.—For the repair of the Chippenham turnpike roads, about 17 miles, for a term of years from the 1st day of June next. Specification at the office of the clerk, and copies furnished at stationer's charges. Sealed tenders, stating terms, must be delivered to the clerk, before twelve noon, on the 25th inst.

RESERVOIR.

FYLDE.—For the construction of a reservoir, upon the Grizedale Brook, about three miles from Garstang, and near Seorton Station, on the Lancaster and Preston Railway; and a reservoir near Wootton-lane Ends, about three miles from the Kirkham Station of the Preston and Wyre Railway, for the Fylde Waterworks Company. Plans, &c., and all information obtained at the office of Mr. T. B. Foster, C.E., 23, John Dalton-street, Manchester, from whom specifications and forms of tender can be obtained on payment of 10s. for each reservoir. Tenders must be sent in to Mr. T. A. Wilkinson, the secretary of the Company, at the Fylde Waterworks Office, Kirkham, not later than the 28th inst. The reservoirs will be let in separate contracts.

KENT.—For the construction of a high service reservoir near the "Star Windmill," Chatham, for the Brompton, Chatham, Gillingham, and Rochester Waterworks Company. Further particulars may be obtained, and the plans, &c., inspected, by application at the Company's offices, Military-road, Chatham, or at the office of J. Pilbrow, Esq., engineer to the Company, 34, Great St. Helen's, London, E.C., where also specifications, conditions of contract, and forms of tender may be obtained upon payment of 5s. Tenders (properly endorsed) must be sent in, addressed to the directors, at their offices, Chatham, on or before the 22nd April.

RAILWAY WORKS.

ALVA RAILWAY.—For the construction of the whole works on the line from Cambus station of the Stirling and Dunfermline Railway, to Alva, being about 3½ miles in length. The whole to be let in one contract, which is to include the construction of the stations and station buildings connected therewith. The rails, chairs, spikes, and the iron girders for the bridge over the Devon, will be supplied by the railway company. The plans, &c., are at the secretary's office, Alva, or at the office of James W. Stewart, Esq., C.E., 73, George-street, Edinburgh; and duplicates will be furnished to intending officers. Sealed tenders, addressed to the secretary, and marked "Tender for Works," must be lodged at his office on or before the 26th inst.

CALEDONIAN RAILWAY.—For the construction of the Stonehouse Branch, about 4 miles 38 chains in length. Plans, &c., at the office, in Glasgow, of Mr. George Graham, the Company's engineer, where duplicate schedules and blank forms of tender may be had, price one guinea. An assistant engineer will attend at Stonehouse, on Friday, the 11th, at 12 o'clock, to accompany intending officers over the line. Sealed tenders, addressed to the secretary, at Glasgow, must be lodged with him on or before 28th April.

DARLINGTON.—For the erection of a cast-iron portico at Darlington Station, on the North Eastern Railway. Plans, &c., and further information, on application to Mr. Prosser, architect, Newcastle. Sealed tenders, marked "Tender for Darlington Station," to be sent in to the Secretary not later than the 23rd inst.

FERRYHILL.—For the erection of sheds over the platforms, &c., at Ferryhill Station, on the North Eastern Railway. Plans, &c., and further information, on application to Mr. Prosser, architect, Newcastle. Sealed tenders, marked "Tender for Ferryhill Station," to be sent in to the Secretary, not later than the 23rd inst.

EXETER.—For the erection of a roof for the new station at Exeter, of the Bristol and Exeter Railway, having an area of about 500 squares. Drawings, &c., at the Engineer's Office, Bristol Terminus, to the 5th of May. Sealed tenders to be addressed to the Secretary, A. Moore, Esq., on or before the 6th May.

SEWERAGE.

BRIGHTON.—For constructing a main sewer and outfall in the Brunswick-square and terrace district. Plans, &c., at the office of R. G. Suter, Esq., the surveyor of the Commissioners, at their rooms in Brunswick-street West, 11, 12, 13. Tenders in writing, sealed, and endorsed, "Brunswick-square and terrace drainage," are to be delivered on or before 5 o'clock on the 30th April, at the offices of Messrs. Hill and Fitzhugh, solicitors, Brighton.

GASWORKS.

KENT.—For the performance of the work required in the extension of their retort-house and coal store, and alterations in other parts of the works, at the Gravesend Gasworks. Plans, &c., at the Company's Works, Gravesend, and further information of Mr. J. Church, C.E., Chelmsford. Forms of tender may be had from Messrs. Southgate and Son, secretaries, Gravesend, and tenders are to be sent or delivered there on or before the 30th instant, marked "Tender for Building."

THE METROPOLITAN BUILDING ACT.—A bill to alter and amend the Metropolitan Building Act of 1855 has been brought into Parliament by Colonel Sykes and Admiral Walcott. Its chief provision is that the rules of the Act of 1855, limiting the cubical dimensions of buildings shall not apply to any structure to be used wholly for the construction of boats by machinery, erected at a distance of more than three miles from St. Paul's Church. Such buildings, however, are to consist of one floor only, and not to be of larger dimensions than 216,000 cubic feet.

THE BLACKFRIARS RAILWAY BRIDGE.—Mr. Hartridge has inserted in the paper of business for the next Court of Common Council the following notice of motion: "That this court assent to the proposal of the London, Chatham, and Dover Railway Company to erect a bridge of five arches, or spans, across the River Thames, near Blackfriars-bridge."

THE RIGHT TO RING CHURCH BELLS.—A curious case having reference to the right of ringing church bells has been heard in the County Public Office, Leicester, when Mr. D. Waite, farmer, of Thurmby, appeared to answer a charge preferred against him by the Rev. J. K. Redhead, vicar, of having, on the 27th ult., been guilty of violent and indecent behaviour in breaking open the belfry door of the parish church. By the evidence it appeared that from 1857 it had been the custom of the churchwardens of the village, on the occasion of Lord Stamford's hounds meeting there, to ring the church bells in honour of his lordship. When, however, the hounds met on the 17th ultimo, the vicar felt it his duty to interfere, and ordered the bells not to be rung, with the understanding that if his commands were disobeyed he should take legal proceedings against the parties offending. Accordingly, on Sunday evening (the day before the hounds met), he nailed down the latch of the belfry door, besides taking the precaution to prevent ingress by locking the door and tying the key in it. At seven o'clock the following morning the defendant gave orders to the parish constable (who happened to be a wheelwright) to open the door, which was done by lifting it off its hinges with a crowbar. The ringers then ascended the belfry, and for two hours or more rang the bells in honour of Lord Stamford's visit. The magistrates dismissed the case.—*Western Morning News.*

PUBLIC BUILDINGS.—Mr. B. Cochrane has given notice that on Tuesday, the 29th of April, he will move for a royal commission to inquire into the state of public buildings erected by Parliamentary grant during the last twenty years; also into the state of houses which were rented for the public service, and to inquire whether, by adopting any more comprehensive plans, greater public convenience, economy, and unity of design might not be attained.

CONSERVATIVE LAND SOCIETY.—The thirty-eighth quarterly meeting was held at the offices, 33, Norfolk-street, Strand, on Tuesday, the 8th inst. The quarterly report gave a very satisfactory account of receipts, amounting to £17,821 17s. 11d. in the quarter, showing an increase over the corresponding quarter of last year of £3,093 11s. 9d., and an increase over the Christmas quarter of £4,292 16s. 7d. The total sale of land to Lady-day amounts to £304,885 10s., being an increase to the extent of £42,235 15s. 7d. over the returns to Lady-day, 1861. Two allotments have already taken place this year of the Queen's-road estate, Tonbridge Wells, and the two estates at Newark-upon-Trent. Another allotment is fixed for the 30th inst., when the last portion of New Roehampton-park estate, a fourth portion of the Round Hill Farm estate, Brighton, with houses in occupation on the Round-hill-crescent, and ground rents at Battersea and North Bow, will be offered to the members. The directors have been, and are, in negotiation for various estates in different parts of the country, and are looking out for an eligible purchase in or near London.

THE "BUFFS" MEMORIAL WINDOW IN CANTERBURY CATHEDRAL.—The east window of the Warrior Chapel in Canterbury Cathedral has recently been filled with stained glass, dedicated by the officers, non-commissioned officers, and privates of the above regiment, to the memory of their brethren in arms who fell in the Crimean campaign, 1855-6. The idea suggested in all the subjects is typical of conquest—No. 1, Abraham offers Isaac—victory of faith. No. 2, Israel conquers Amalek; Aaron and Hur holding up the hands of Moses—victory by a sign from God. No. 3 (the centre), our Lord crowned and bearing the banner of the Resurrection is met by the spirits in prison—victory over Death and Sin. No. 4, Gideon conquers Midian, himself the least in his father's house—victory by obedience. No. 5, Jehu conquers Ahab—victory by force of arms. In the upper part of the centre light is shown fully the regimental flag, and at its base the regimental badge, with the motto, "*Veteri fronscescit honore*," upon a rich mosaic groundwork, composed of the oak. At the base of the side lights, and also in the upper tracing opening, the heraldic badges in connection with the Buffs are frequently introduced, viz., the Rose and Crown, the Dragon, the grenade, and the White Horse of Hanover. The inscription, incised in marble and surrounded by a border let in with coloured cement, is as follows:—"To their brethren in arms who fell in the Crimea, 1855-6. The east window of this chapel is dedicated by the officers, non-commissioned officers, and private soldiers of the Buffs. (3rd, or East Kent Regiment.) A.D. 1862." The memorial is by Messrs. O'Connor.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged if authors or readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

W. R. J. F.—Has sent a portion only of promised paper.

K. F. S.—Below our mark.

M.—Yes, if suitable.

Mr. G.—We should accept and pay for such an article if suitable; but to a stranger we can make no promise.

Subscriber.—We fear that you are too late, but will see what can be done.

T. K. T. B.—Shall appear.

Messrs. F. and H.—Similar complaints constantly reach us; remonstrance seems unavailing.

A CONSTANT READER.—Thanks for good opinion of our labours.

M. Z.—Send photograph, and subject shall be engraved.

Mr. S.—N.—We cannot interfere in disputed accounts.

R.—Declined with thanks.

Q. B.—Send address and proof shall be forwarded.

H. S. W.—No doubt you have a claim for compensation; take good legal advice. We cannot advise you at length in these columns.

* * * All communications to be addressed, *The Editor of the BUILDING NEWS*, 20, Old Boswell-court, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 18 to 21, Old Boswell-court.

Advertisements are received up to six o'clock on Thursdays.

MR. PEABODY'S GIFT TO THE LONDON POOR.

NE of the most munificent instances of private benevolence on record has occurred within the last few weeks in the metropolis of this country. It will be fresh in the recollection of our readers that Mr. Peabody, an American merchant of high standing, and one who has for many years been actively engaged in business in London, has conveyed to trustees the sum of one hundred and fifty thousand pounds, to be devoted to the improvement of the condition of the London poor.

This benefaction is distinguished from ordinary charities in many ways. It consists of such a sum of money as ordinarily is never devoted to charitable purposes, except in the form of a legacy, and this sum is voluntarily set aside by the donor during his lifetime. It is further not the gift of a successful man to his native town, or of a fortunate emigrant to the country of his adoption, for Mr. Peabody is not an Englishman, or a naturalised Englishman. His native town has already benefited largely by his liberality, and he is, we are informed, preparing to return to his own country, after having spent the active years of his life in ours. Lastly, there is in the objects to which this benefaction is to be applied much of large-minded liberality, and an entire absence of either sectarian prejudice or personal bias. We hear

of nothing except that a large sum of money is placed in the hands of a few trustees, with the general directions that they are to employ it for the good of the poor of London in any way that may seem to them most advisable, without prejudice for or against any sect, class, or nation; and without any special mode of employing the fund being prescribed. All this is so different from the ordinary methods of rich men, who mostly hold their money as long as life lasts, and then subtract from what they leave to their heirs a sum or sums to be devoted to specific objects or specific charities, churches, or institutions, that we cannot fail to look upon it with surprise, and ought unquestionably to recognise it with marked approval.

It is right to add, before going further, that Mr. Peabody makes one suggestion in his memorandum descriptive of his intentions with regard to this fund; and that this suggestion, not only on account of its being the only special destination pointed out for any portion of the money, but also on account of its great value and good sense, will be sure to have the greatest possible weight with the trustees. The special object alluded to is the *improvement of the dwellings of the poor*.

Mr. Peabody must well know, if he knows at all, the state of the London poor, that the deplorable condition of their dwellings is one of the unhappy circumstances which tells most against their health, their comfort, and their morality. Perhaps there are other evils as great or greater, and as much crying for removal, but it is not everything that money can do. Money cannot buy justice for the oppressed; cannot gain the attention of the powerful to the cry of the weak; cannot right social wrongs; cannot do anything towards making good a deficiency of kindness, or honour, or truth, or sense of duty. Money, however, can buy land and build houses, can procure the best advice and secure substantial and efficient comforts in what it builds, and it was therefore wise in making a grant of money to point out this as one of the fields in which it is to be employed.

With regard, however, to the whole detail of how this object is to be furthered, and to the entire plan with this one exception, all is left to the judgment of the trustees; and we cannot but feel anxious to know what their decisions will be, and what course they will pursue. The capital and the interest, if misapplied, will become a premium on idleness, beggary, vice, or, if wasted, will present the sad spectacle of a noble opportunity lost, while, well appropriated, this fund will be likely not only to do great good, but to form a model upon which other such funds will be based, and possibly a nucleus to which other sums of money will be added.

The sum of £150,000, if invested to yield 5 per cent., would represent an annual income of £7,500, and supposing this was decided upon as the better course to pursue in the management of the fund, it is clear that a very considerable annual amount of good might be done, especially if the trustees were to take the course of assisting private or other efforts in place of originating schemes of their own. This plan has been pursued with marked success by certain benevolent societies. Few, if any, societies have made a moderate income represent so extensive an influence and so much good in their own way as the various church and chapel building societies. The Incorporated Church Building Society, the various diocesan societies, and sundry such societies among various bodies of dissenters, have all followed very nearly the same method. They have some of them occasionally originated and built new churches, but ordinarily the practice of all of them has been to content themselves by giving a liberal donation towards the funds of church-building undertakings started by private individuals, and in doing this they have afforded the benefits of their experience and acquaintance with the undertaking in addition to their pecuniary help; and, further, have uniformly insisted on such a control over the plans and the carrying out of the building as shall tend to secure

that the work should be substantial and the accommodation comfortable and complete. Added to this, some of these societies have a loan fund, and are prepared to advance money to assist these undertakings in addition to their contribution.

It is notorious that the encouragement afforded by the operations we have just been describing has, in numberless cases, occasioned the erection of churches which would not otherwise have been built, and that the professional scrutiny of plans and specifications secured, has, in many cases, prevented mistakes which would have led to unfortunate or disastrous results, had they not been thus detected in time; and the same thing would be true of the operations of Mr. Peabody's trustees, were they to take a similar course.

Let us take for example the case of improving the dwellings of the poor. It would be a wise appropriation of money if, in the first place, all the information accessible were collected and published, including plans of all the most successful labourers' dwellings for cities, and statistics of their success or failure; then perhaps here and there a specimen block of buildings might be erected, or a row of cottages drained, improved and rendered healthy, as examples and experiments; but we apprehend the most extensive good would be done were it known that the trustees would contribute a certain amount, or a certain proportion of the expense in cases where landowners or companies would erect dwellings complying with certain conditions, or would effect certain improvements in defective dwellings. And to this might be added, as in the case of the church building societies already alluded to, further assistance in the shape of a loan.

The objection will, no doubt, occur that this devotion of money, instead of helping the poor, would in reality help house-builders; and to this the only answer to be made is, that probably in no other way could so much be done for the dwellings of the poor with the same amount of money. Building good houses for the very poor, and improving bad houses, is a business notoriously uncertain, and not attractive to speculators, but this assistance would probably cause it to be undertaken in many instances; and, as the trustees might connect with their grant the conditions that each tenement should not be let above a certain maximum rent, and should not be let for infamous occupation, and might retain a legal power of enforcing these conditions, it appears clear that a great benefit might result.

We would, however, suggest that aid should be afforded from this fund for other measures of social improvement which are not touched by legal provisions. There exists already a machinery for the regulation of drainage, but we are not sure how far the improvement of water supply might not be advantageously assisted; and we are quite sure that the establishment of additional baths and wash-houses might be promoted with great advantage, and the opening of reading-rooms or other such places of resort for labouring men would be another measure where help from a fund like this would be invaluable.

Such measures as we have been describing have been already taken, with the best possible results, in many localities where the resources existed for their prosecution, and usually at the instigation, and often also at the sole expense, of the parish clergy, aided by a few of the liberal and benevolent inhabitants; but, in many localities, and those places where the need of such auxiliaries to improvement is the greatest, there is no possibility of establishing anything which makes a demand upon funds—there are not enough resources available; and in such cases as these a liberal subscription and experienced advice would be of the greatest value.

If the discomfort of the dwellings of the poor be one great and radical source of misery, there are two others which combine with it, and for which no remedy of real efficacy has yet appeared. The first is the unskillfulness, mismanagement, waste, uncleanness, in short, thriftlessness of most poor women; the second is the attractiveness to all poor men, and women too, of the public-house and of strong drink.

If the fund we are discussing is administered by persons desirous of striking out a new path for themselves, here is an ample field for them, very nearly unoccupied, and promising the happiest results to those who successfully grapple with its difficulties. We fear, however, that among the things which money cannot buy will be found the secret of teaching poor women how to make the most of their little means. This, when it is done, will be done by the personal exertions of educated women desirous to set right somewhat of the much that is still wrong in spite of our boasted civilisation; and may, perhaps, be aided a little by judicious teaching in schools.

There is, however, a fairer opportunity open for benevolence in the opportunity for taking such measures as shall make a successful attack upon drunkenness and the public-house.

A hundred years ago drinking was more rife in the higher circles than it now is in any grade of society, but the progress of education, and a change in public opinion, have brought a complete revolution to pass. If such a change is possible in one social class it is not impossible in another, and the greatest of all benefits will be conferred upon London and the London poor by any step which tends considerably to diminish the amount spent in gin palaces and common taverns.

We are not intending, in a few words at the very end of an article, to propose a scheme for the diminution of this master vice, but we believe that the key to at least a palliation will be found, if Mr. Peabody or any other benefactor will give working men or other poor people somewhere else to go to than the public-house, and something else to enjoy besides drink. Were a thoroughly unexceptionable class of public music, reading and coffee rooms open, such as would in no way offend the prejudices of working men, and would meet their wants and leave them as uncontrolled

and as free from interference as they are at the public-house, we believe that the better class of men would frequent them at once, and that they might in time effect much towards diminishing the number of the frequenters of public-houses.

What has been said shows the need of great prudence and sagacity in the employment of this charity. These qualities we are willing to hope will be brought to the task of dispensing it, and will, if used right, secure the fulfilment of the intentions of the generous donor.

As to the gift itself, and the liberal feelings which have prompted it, there can but be one feeling, and we are glad to learn that the City of London is taking steps to mark its sense of the recognition due to such an act by the best means in its power—namely, presenting Mr. Peabody with the freedom of the City. It is also somewhat interesting to find that the opinion expressed by the donor as to the first object towards the promotion of which the fund should be appropriated has been fully appreciated by those best able to judge. At a recent meeting of inhabitants of the ward of Portoken held to consider the subject, the following resolution was come to:—"That this meeting, representing as it does one of the poorest districts of London, desires to express its opinion that the improvement of the dwellings of the labouring classes is the great necessity of the day, and likely to promote the happiness and well-being of the metropolis." This is very true, and we hope to see the most sanguine wishes of Mr. Peabody fully realised, and that he may live himself to behold some at least of the good results of his liberality.

ARCHITECTURAL EXHIBITION.*

THE most conspicuous object this year in the Architectural Exhibition is a full-size sepia drawing of a window erected to the memory of the eighth Earl Waldegrave, by Mr. Gibbs, of Euston-road. It has one great advantage over the window itself in having the subject depicted in one tint only; but it has been most injudiciously hung, with a strong light full upon it. In a partially-darkened room its size and the vivid description of its author would have enabled an ordinary imagination to conceive the powerful solemnity of the subject, which Mr. Gibbs has very originally treated. The architecture in Mr. Gibbs' cartoon is not quite correct, but the costume is in keeping with it. In this the artist has shown great skill. He evidently adapted his window to the country church in which it was to be placed. It would be as absurd, he seems to imply, to lay the poetry and refinement of such a subject, or the historical research necessary for educated men, before a country congregation, as it would be to sprout Shakespeare to ploughmen. The child can see in this window his *beau idéal* of a Roman soldier, and plenty of bright colour undiluted by the conventionality of tyrannical schools. With familiar details the artist has successfully appealed to the hearts of the ignorant. He has not worked for the fastidious few, but for the many, who have neither time to seek for, nor ability to understand, the higher qualities of glass painting. Looked at from this point of view, the design surpasses anything which we have lately seen. It is, in fact, only excelled by the window itself. We expected, however, to find it at the International Exhibition. It says much for Mr. Gibbs' modesty that he consents to hang in Conduit-street a work which would have been at the head of its peculiar class even at South Kensington. Personally, we should, as we have said before, preferred to have had the cartoon hung in a darkened room, whilst the painted glass might, to its greatest advantage, have been hung here upon the wall in its place. Opposite to it, over the entrance-door, where it is likely to escape the notice it deserves, is a drawing of an entirely different stamp, by Messrs. Heaton, Butler, and Bayne. The composition of the group and every line of the drapery is conceived in a masterly manner, and drawn firmly in. There is no strained effect—no theatrical clap-trap; but manly, refined power and Christian sentiment. The same knowledge which has guided the hand in drawing the figures has presided also over the minutest fraction of floral ornament. There is only sufficient colour to relieve the figures; but the drawing in this cartoon, as in Mr. Gibbs', may very confidently be accepted as the prologues to the works themselves.

Messrs. Lavers and Baraud also contribute two or three drawings of stained glass windows, but they are on so small a scale, and hung so high up on the walls, that without a step-ladder, which the Committee do not furnish, we are unable to do justice to them. For beautiful colour in stained glass we must turn to the contributions of Mr. J. P. Seddon, from Rheims Cathedral (193, 199). Faulty as the drawing is—and it is even more so in Mr. Seddon's drawings than in the original—the colours and the combinations of them leave the efforts of all modern glass painters immeasurably behind.

Of designs for public buildings in our metropolis, the Exhibition, which heretofore gave us generally several, now affords but one. It is a design, by Mr. C. H. Smith, for an octagonal vestibule, with four porticoes, to the principal Government offices at the crossing of two main thoroughfares. Four sides of the octagon have arched openings, and the semicircular porticoes, with red shafts and Corinthian caps, stand upon a high flight of steps against the others. The view through the arched opening in front is meant, we suppose, to represent Parliament-street; but it resembles that busy thoroughfare about as much as that calm retreat of studious and melancholy men, Dances-inn, resembles Cheapside. On each side of the before-mentioned porticoes, where sentry-boxes and foot-guards would in reality be placed, Mr. Smith has fixed equestrian gilt statues of royal personages. The angles of the openings are chamfered, and in the cham-

fers piled-up figures of Victory and Fame are surmounted by carvings of the Westminster Gridiron. On the internal angles of the octagon small brackets project from the impost mouldings, and bear alternately busts of the lion and the unicorn. They are no longer simply divided by the heraldic shield; an impassable gap here, to their evident bewilderment separates them. The main cornice is arched upwards at intervals to enclose small niches which at that eminence surround the vestibule, and afford accommodation for stowing away some very unprepossessing statuettes. The whole is covered by a coffered dome.

Another gentleman of the same name, but with different prefix, Mr. F. Smalman Smith, treats us to an amusing puzzle in his *Architectural Recollections* of 1851, the chief point in which—as we find from the twelve or fourteen lines of elucidation vouchsafed us in the catalogue—is a column commemorative of "the successful consummation of that great enterprise the International Exhibition." We have to look a long while amongst the vast display of glass roofs which constitute the design ere we discover modestly hidden in convenient indistinctness, the object of so grand a flourish of the author's trumpet; and then, to understand what the fever scratches signify, we have to turn again to the catalogue for the unrevealed excellence of this long-nursed trophy. The four quarters of the world are assembled round the rose, shamrock, and thistle, and British lions guard the gathering. The "crown is represented by a band proceeding from the letter A," and the three kingdoms are united with it in carrying out the project. The four quarters of the world—which we have just announced on the author's authority, were at the base of the column, surveying with curiosity the triple flowers—are, in duplicate, seen at the summit, offering a testimonial to the Prince. "Internal reliefs, frescoes, and stained glass surrounding the central stair, would carry the datum line of the world science and art at this period into future time." Such is the author's account of what appears but a shapeless post; but, in common fairness, we must add that a fraction of the column obtained "honorary mention Class A." A small portion of it only could have been exhibited. If the whole had been shown, together with the author's description, the one stone which leads from opposing qualities might have brought the author's grief, instead of landing him with such distinction twined round his fortunate temples.

The designs for the Hull Town Hall form an important part of the Exhibition. We have contributions from some five or six of the competitors. The prize design, by Mr. Cuthbert Broderick, is placed upon one of the screen and was sent seemingly after the catalogue was compiled. It is a fine Italian design, and consists of two ranges of semicircular windows, ar three-quarter columns, and of a high square tower in the centre of the front. Thus, in general arrangement resembling the Flemish halls, but differing of course from them in the details, high-pitched roof, dormers, ar pinnacles. Messrs. Green and De Villes' design, which gained the third premium, is likewise here. A massive colonnade and balcony along the front is supported upon cantilevers. This, the most striking feature of the design, would, in execution, look heavy in the extreme. The foliate panels between the Corinthian caps in the wings destroy the effect of the carved capitals, besides giving the entablature the appearance of increase and too great depth; still, there are many good points about the design. The architects, in fact, show in another drawing—"design for the Town Hall, Northampton,"—a somewhat similar arrangement more judiciously treated. The columns here properly rest upon solid piers, connected by an arcaded entrance, and appear as component parts of the design instead of as excrescences upon it. The foreign Gothic designs are numerous, but those of Mr. Godwin and Mr. Eddis stand prominently forward from the rest. That of the former gentleman is in the same style as his Northampton design, but it is even more meritorious. There is a triple arcade in front, with statues on small buttress-like columns between the windows on upper floor, having their canopies cutting into the principal cornice. There are towers over each wing, varied in their outline and design. A great superiority over its fellow of Northampton lies, however, in its excellent relative proportion of ground floor and superstructure, whilst its fine picturesque outline and clever detail make us regret that it will exist but upon paper. It is by far the finest work which Mr. Godwin has yet produced. His design for Swansea reminds us of his former inferior work. The windows are cramped by the flat buttresses between them, and the blank arcade is a feature which would entail a good round sum for the disfigurement of the building. There is a fettered look in it which is extremely unpleasant. We long for a bit of blank wall, and if our reader would appreciate the value of this cheap means of decoration, let the look, in passing, at Mr. Lamb's warehouse for the "Consignment and Store Company," 40, and then contrast it with the crowded lines in an adjoining frame; as, for instance, those of the new buildings at Newcastle upon-Tyne. In frame 72 we have another design for the Hull Town Hall. It is a wild production, executed in Mr. Street's familiar manner, but resembling it about as much as a German chromolithograph resembles one of Turner's pictures. The wonder, however, is that Mr. Phipps, who can appreciate Mr. Street sufficiently to copy him, cannot, with such practical as he has had—for we have already noticed his dead copy of that gentleman's best known church—do it better, or see that he fails to do it other than amusingly. The design is on a par with the execution. It is a systemless conglomeration of features which skillful men use effectively but which are fatal in inexperienced hands. Mr. Phipps makes use of similar features to Mr. Godwin, but he lacks equal power to weld them homogeneously together.

Mr. Eddis' design for Hull Town Hall is placed too high to be properly examined, but it has evidently been made in a genuine Gothic spirit, and

* See pp. 210, 227, 265, ante.

is fully equal to the other works in the same style, which the architect elsewhere exhibits.

Mr. Goldie's production for the same building has his usual characteristics—a thorough devotion to Medieval art, which precludes him from dispensing with even those portions which are useless in the nineteenth century. To retain them he would find use for them. Busts are introduced in the spandrels over arcades, and sculpture at the angles over the columns, as in the well-known Doge's Palace.

For an able extension of Gothic art, commend us to the manly work of Mr. Mileham, 175, 176, 180, 184, "a Design for a Museum." It is drawn with marvellous accuracy, and conceived without an atom of trickery or artifice. There is no shower of crockets or bands of coloured material; no flashy display of perky detail or masquerade in old-fashioned second-hand conceits. Mr. Mileham has avoided these seductive syrens, and has produced a work inferior to nothing in the Gallery for the highest qualities of architectural art.

Besides this work of Mr. Mileham, two other students exhibit here their competition drawings; but neither the Design for an Exchange, by Mr. Watson (108, 109), which obtained the gold medal of the Royal Academy in 1861, nor the College of Mr. Ernest George, 268, 271, 276, creditable as they both are to their respective authors, show the purity of style and the free development of it which are conspicuous in Mr. Mileham's work.

We have left ourselves but little space to speak of several other drawings which we had marked for notice: the competition design for the New Opera House at Vienna, is fully illustrated in some badly executed drawings by Mr. Shoubridge. It has an extensive portico, a huge dome, and four towers at the angles of the block. We have no doubt that there were many worse designs submitted, and, we would fain hope, many better.

A residence erected in Yorkshire, in 1856, by Mr. Butler, is exceedingly clever, especially when we consider that it is adapted to an old house. It would, however, be better, we think, without the panels of coloured material.

We are glad to find that the suggestions which we threw out in our article on the Pugin Collection, have been taken in the spirit in which they were made. Mr. E. W. Pugin has removed his own works into the East Gallery, and put in their place additional memorials of his gifted father. This action is the more commendable because Mr. Pugin has taken it with the knowledge that his own drawings could not be hung properly in consequence of the walls being already in some way or other covered. They deserve a more careful examination than they are now likely to get.

REGISTRY OF ORNAMENTAL DESIGNS.

WE learn that the Chambers of Commerce of Birmingham and Sheffield have been engaged for some time in endeavouring to effect an extension of copyright in ornamental designs. It will be seen by the following communication, addressed to the Birmingham Chamber, how far the effort has been successful:—

"Office of Committee of Privy Council for Trade,
Whitehall, April 9, 1862.

"GENTLEMEN,—I am directed by the Lords of the Committee of Privy Council for Trade to acknowledge the receipt of your memorial, praying for an extension of the terms of copyright for ornamental designs applied to works in metal, and supporting your application by the statements of manufacturers personally engaged in the several departments in that branch of trade.

"From the evidence thus furnished it appears that the time occupied in preliminary arrangements, and the preparation of designs previous to the manufactured article being presented in the market, varies from six to twenty-four months. The majority of those by whom these statements are furnished ask that a period equivalent to the time thus consumed may be added to the existing term of protection, thus extending the whole to five years.

"My Lords direct me to acquaint you that, considering a case to have been shown for the expediency of this extension, instructions have been given to the officer at the head of the Registry of Designs, to take the necessary steps for extending the copyrights of all articles in metal included in Class I. during three years, as at present, to five years for the future.

"I am, gentlemen, your obedient servant,

"J. EMEISON TENNENT.
"To the Council of the Chamber of Commerce of Birmingham
and the Midland Districts."

BRITISH ARCHAEOLOGICAL ASSOCIATION.

THE annual general meeting was held on the 9th inst., G. VERE IRVING, Esq., V.P., in the chair.

The report of the Auditors, balance-sheet, lists of Associates elected, withdrawn, and deceased, were read. The finances of the Association were shown to be in a favourable condition; £702 3s. 2d., including a balance from the previous year, had been received, and £530 2s. 6d. paid by the Treasurer; leaving a balance in favour of the Association of £172 0s. 8d. This included the entire payments of the *Journal* for the year, and on account of the first part of the "Collectanea Archaeologica," all receipts upon which have not yet been received. Forty-eight Associates had been elected; twenty-three had withdrawn; ten had died; and three were directed to be erased from the list for non-payment of their subscriptions. Obituary notices of the deceased members, I. Bateman, Lord Braybrooke, W. G. Carter, J. Clarke, Right Hon. C. Tennysou D'Eyncourt, E. S. Lee, W. Newton, S. Leigh Sotheby, G. E. Harcourt Vernon, and the Rev. F. H. Wilkinson, M.A., were read by the Treasurer.

A ballot then took place for the officers and Council, when the following were elected:—President, Sir S. H. Northcote, Bart.; Vice-Presidents, Sir C. R. Boughton, Bart., J. Copland, M.D., G. Godwin, N. Gould, J. Heywood, G. Vere Irving, T. J. Pettigrew, and Sir J. Gardner Wilkinson; Treasurer, T. J. Pettigrew; Secretaries, J. H. Planché (Rouge Croix) and H. Syer Cuming; Foreign Secretary, T. Wright, M.A.; Palaeographer, C. Hooper; Curator and Librarian, G. R. Wright; Draftsman, H. C. Pidgeon; Council, G. A. J. Alger, W. H. Bayley, Dr. W. Beattie, W. H. Black, H. G. Bohn, G. M. Hills, J. Lee, LL.D., E. Levein, M.A., W. C. Marshall, R.A., G. Man, R. N. Phillips, J. W. Previt, Rev. J. Ridgway, M.A., E. Roberts, S. R. Solly, and R. Temple; Auditors, G. G. Adams and G. Patrick.

THE ALBERT MEMORIAL.

THE ordinary fate of men who start on great enterprises unmindful and utterly regardless of the means whereby they can be brought to a successful issue, has befallen the Committee of the Albert Memorial. It has now not only to acknowledge its failure, but to detail to the Royal Lady who commissioned it the various reasons which have produced it. The Queen, suggested through Lieut-General Grey, that an obelisk might be found the most appropriate form of monument provided it be on a scale of sufficient grandeur, and that its base should be surrounded with groups of statuary. There was in this suggestion ample scope for the deliberations of the Committee, but it got a monolithic idea into its united head, and, so huge was it, there was no room for aught else to rest there. It did not pause to consider how a statue of the Prince Consort could be associated with it, without having a secondary position, or how the surrounding sculpture could be combined with a tapering shaft some 80 feet above it. North, east, south, and west, in the three Kingdoms, and in Russian Finland, they sought the realisation of their solitary idea. Their first consideration was not to produce a monument of artistic grandeur, which should impress the character of the Prince upon the mind of the spectator, but a "monolith of approved colour and durability," which should enable the compilers of metropolitan guide-books to inform the curious reader that it was so many feet higher than anything of the kind which ancient Egypt or modern Rome can boast of. Just when the French have become sensible of the folly of transporting their obelisk to fix it amidst sculpture with which it does not accord, our Committee would have led us in the same wasteful and disastrous track. When our sculptors hoped to show to the world that they were capable of recording the high qualities of the departed Prince, when they had an opportunity, and with it a worthy subject with which to redeem our London statues from the contempt so frequently thrown upon them, the Committee confines its attention exclusively to "the question of the possibility of finding a monolith." In vain we have pointed out that more than the sum already subscribed would be swallowed up in transport alone. We have given from the engineer's own book the cost of rearing that in the Place de la Concorde, which is not one quarter the weight of that to which the sanguine expectations of the Committee was directed. It is answered to us by the Lord Mayor that the public requires to be "educated to the appreciation of a monolith." It is a novel spectacle to see a London Alderman, who by rotation sits at the Mansion-house, expound art theories; but he should have known that monoliths were appreciated in England before broadcloth was, and that Britons reared them when they painted their backs and were ignorant of Lord Mayors and Aldermen. Perhaps, however, as a matter of precaution—being about to sit on a committee of taste with the Earls of Derby and Clarendon and Sir C. Eastlake, and to preside at banquets in the Egyptian Hall—he felt bound to read up Egyptian archaeology, and, unexpectedly big with a little information, he must needs deliver himself publicly. The monolith is appropriate, he says, because the Egyptians, at the height of their civilisation, erected them. "What's Heeuba to us, or we to Heeuba?" The Assyrians, at the height of their civilisation, set up the combined forms of a man, a lion, an ox, and an eagle; the Hindoos those of monkey-gods, bulls, Vishnus, and Venuses. Other nations, at the height of their civilisation, have worshipped unknown gods and idols, which would have been just as well unknown. The folly and errors of the old nations are for our instruction, not for our imitation; but why, of all nations, should the Egyptians and their deeds be singled out from other nations for blind imitation? They carved rams, cows, cats, and goats, and consecrated them as symbols of their deities, and reduced mythology to a system; with it and allegory they constructed an impenetrable veil, which concealed religion from the eyes of the vulgar. The foibles and frailties of men have been transmitted by them to us incorporated with the attributes of supreme divinity; and the same heterogeneous mixture of the mighty and the mean is read by discriminating eyes in their architectural works. At an almost fabulous expenditure of men, money, and time, which we should regret to see imitated now, they erected their enormous temples and pyramids; their buildings had sloping walls, huge bolster columns, and deeply hollowed cornices; they adorned them with winged globes and unintelligible hieroglyphics. They did this "at the height of their civilisation," and this, Mr. Cubitt implies, we ought, consequently, to do to show our advanced position. But his dogmatic censure of the opponents to the foolish monolithic idea is not even based upon accurate information. The Egyptian monoliths were not erected to the memory of individuals, and were never even set up singly. They stood in pairs on either side of the entrance to their temples; they were inscribed with historical facts, and in style are inseparably connected with the buildings on the banks of the Nile, which have, happily, their only representative here in the Egyptian Hall, Piccadilly.

These remarks are suggested by the proceedings at the Committee meeting last week. (See page 279, ante). This week we have to record a letter from the Committee with reference to the *monolith*, and the reply of General Grey. The Committee write:—

"We, the members of the Committee appointed by your Majesty to consider the best means of giving effect to your Majesty's wishes in respect to a memorial to his Royal Highness the Prince Consort, humbly beg leave to report to your Majesty the result of our preliminary proceedings with reference to the matters committed to us.

From a letter dated the 19th of February last, addressed by Lieutenant-General the Hon. Charles Grey to the Right Hon. William Cubitt, the Lord Mayor, we learnt that your Majesty had "come to the conclusion that nothing would be more appropriate, provided it be on a scale of sufficient grandeur, than an obelisk, to be erected in Hyde Park, on the site of the Great Exhibition of

1851, or on some spot immediately contiguous to it;” and that, “there would also be this advantage in a monument of this nature—that several of the first artists of the day might take part in its execution, for there would be room at the base of the obelisk for various fine groups of statuary, each of which might be entrusted to a different artist.”

In accordance with the views thus expressed we considered the condition of magnitude in the obelisk to be indispensable.

We could not but be apprehensive that considerable difficulties would have to be encountered in the ulterior arrangement of sculpture round the base, whether near or at some distance, bearing in mind the importance of giving the necessary prominence, in position and effect, to the statue of his Royal Highness the Prince Consort. We resolved, however, without entering on the consideration of this point, to confine our attention exclusively, at first, to the question of the possibility of finding in the United Kingdom a monolith of sufficient dimensions, combining with an approved colour the important condition of durability.

Our attention has, for these reasons, been restricted to granites. In our inquiries we have derived great assistance from the Director-General of the Geological Survey, Sir Roderick Murchison, through whom, with the aid of his correspondents at the quarries at present worked, we have received accurate information on the points to which our attention was chiefly directed. But we regret to say that in most instances the granite rocks so described to us, even when unobjectionable on account of the tint or reputed durability of the material, have not been found capable of furnishing a monolith of sufficient length. We have also to acknowledge liberal offers of materials in comparatively unexplored localities, but the cost of experimental excavations and the uncertainty of the result have deterred us from advising such undertakings.

The only case that has come under our notice in which the various requisites above enumerated may possibly be found to be combined, together with vicinity to the sea and comparative facility of transport, is that of a mass of granite, of a light red tint, in the island of Mull, on land belonging to the Duke of Argyll, who, with great liberality, has placed all such materials on his estate at the disposal of the Committee.

Our investigations have been for some time confined to this locality, and we have to express our thanks to the Ross of Mull Granite Company for the important assistance they have rendered us in enabling us to form an opinion respecting the fitness of the block in question.

The length, which in the excavated portion already exceeds 115 feet, would, we consider, suffice for the intended obelisk. There appears, however, to be reason to apprehend that the width of the stone near the centre would be insufficient, according to the proportions of the most approved ancient examples, to be consistent with that height.

It is also by no means certain that the block referred to has the necessary thickness in those portions which are not yet cleared. An experienced contractor who has examined it has stated that nothing can be affirmed respecting the fitness of the stone “until it be raised and turned out from its present bed.” For such operations a large outlay would be required, and we cannot but hesitate to recommend such outlay while we have no absolute certainty of a satisfactory result.

Although we have considered it on many accounts desirable that a monolith of the required dimensions should be obtained from some part of the United Kingdom, we have not omitted to make inquiries elsewhere. Knowing that large masses of granite of good colour can be procured in Russian Finland, as evinced by various remarkable specimens in St. Petersburg, we have consulted competent authorities respecting the fitness of that material. The replies we have received cannot be regarded as satisfactory, since it appears that the granites in question, however well adapted for interior decoration, have not the reputation of being durable in the open air.

With regard to the important point of expenditure (assuming a monolith to be found in our own country), we consider that, from the variety of estimates we have privately received,—the novelty of the undertaking probably rendering any approach to accuracy difficult,—we are by no means in a position to name a sum that would represent the ultimate cost; more especially as it is the opinion of many that the obelisk would present an incomplete appearance unless the surface were enriched with incised sculpture, on the principle of execution (however different from the representations) adopted on Egyptian obelisks. Without, however, venturing to assign a limit to the entire cost, we conceive we are justified in expressing our opinion that the whole of the sum already subscribed would be absorbed by the obelisk alone.

While, therefore, we see no reason to conclude that success is absolutely unattainable, we believe that it would be accompanied by difficulties and by expenditure at present wholly incalculable; nor can we refrain from expressing our serious doubts whether, even if the mere enterprise were successful, the ultimate effect would be such as to realise your Majesty's just and natural expectations.

Having laid fully before your Majesty the information which we have received, and the inferences we have drawn, we humbly await the signification of your Majesty's pleasure as to prosecuting our present inquiries, or directing them to some other mode of meeting the great object in view.

DERBY.
CLARENDON.
WILLIAM CUBITT.
C. L. EASTLAKE.

Westminster, April 14.

In reply to this General Grey has written:—

Osborne, April 19, 1862.

The Queen commands me to acknowledge the receipt of the report from the Committee named by Her Majesty to advise her on the subject of the proposed National Monument to the Prince Consort.

Her Majesty cannot refuse her assent to the reasons, so clearly and strongly put forward in the report, which induce the Committee to doubt the expediency of any further attempts to find a monolith that would fulfil the conditions on which her Majesty's choice of an obelisk, as the distinguishing characteristic of the proposed monument, mainly depended.

Her Majesty sees, therefore, no alternative but to acquiesce in the abandonment of the idea of an obelisk, and to request the Committee to turn their attention to the possibility of finding some other mode in which the great object in view may be most satisfactorily effected.

Her Majesty's wish is to leave the Committee quite free to recommend whatever may appear to them to afford the best hope of a satisfactory result; and

she would merely throw out as a suggestion whether the opinions of some of the foremost architects of the day might not be advantageously taken as to the means of combining the groups of statuary mentioned in my letter to the Lord Mayor (among which, of course, a statue of the Prince would be prominent) with some other design.

Sir C. Eastlake, &c.

C. GREY.

Now it would seem really, from one sentence in it, that the Lord Mayor had the drawing up of the Committee's report, for, after giving an account of its investigations in the Island of Mull, it speaks of apprehensions that the width of the stone near the centre would be insufficient, according to the proportions of the most approved ancient examples, to be consistent with the height of 115 feet. Now the diameter, which we suppose is meant, of the Egyptian obelisks was about one-tenth of the height; but the groups which it was intended to fix round the Albert obelisk would have altogether changed the character of the erection, and consequently ought to have changed its relative proportions. The error of attempting to out-rival Egypt in mere size, and in ignoring the art attributes of the monument, has, however, been the cause of the Committee's sad acknowledgement of failure. The monolithic idea has hung like a millstone round its neck.

The important point of expenditure at length stepped in to trouble the Committee's deliberations. It is “unable to name a sum that would represent the ultimate cost.” It ought, at all events, to have been able to name the probable amount of the public subscriptions, and to have known that there was a vast difference in ordering a monolith to be hewn from the quarries, squared and sculptured, when labour was almost costless and was directed by arbitrary power, and when it has to be paid for at a higher figure than was ever before paid for it in any country and in any age. Works requiring a large concentration of labour are those which can only be executed when labour is comparatively valueless. We urged this point some time ago, and showed beyond dispute—what was evident to every man unconnected with the Committee—that far more than could possibly be expected from the voluntary contributions of the public would be foolishly sacrificed before an artist's hand could touch the memorial. The Committee now agrees with us that “success would be accompanied by difficulties and by expenditure at present incalculable.”

Having anticipated for some time the conclusions of the Committee, we are not, of course, disposed to quarrel with its tardy acquiescence in our views, nor can we hardly regret the time which has been spent in briaging conviction of the soundness of our views. The reply of her Majesty to the report of the Committee affords us every hope that the matter will now be rightly proceeded with. The monolith is to be left on the island of Mull, and the questionable honour of having reared the largest existing obelisk is still to belong to the Pope, who planted it in front of the Lateran Basilica. Some other mode of achieving the great object in view, more consistent with our powers and the disposable fund, is to be found. More important still is the suggestion that the Committee “might advantageously consult some of the foremost architects of the day as to the means of combining the groups of statuary with some other design.” This very plainly reminds the Committee of what its first proceedings should have been, instead of hunting after a huge block of granite, and talking of educating the public to an appreciation of it. The Queen's letter recalls the Committee to its duty—to advise her on the subject of a monument which shall be worthy in its art display of the Prince to whom it will be reared and of the public who have subscribed for it; and she suggests the course which it had better pursue in order to accomplish her desires.

We have all along said that architects and artists were men regularly educated to conceive such works, and consequently most fit to represent, and to transmit to posterity, in durable material, the character of a public benefactor. The poet does the work in verse, the statesman in the senate, and the Lord Mayor at the Mansion House; but the public monument should be the result of an architect's and a sculptor's labour, unfettered by the fancies of those who have devoted their talents to other, perhaps equally landable, pursuits. A soldier fights a nation's battles, a poet sings and a painter portrays them; a statesman makes her laws and an alderman administers them; but her monuments belong exclusively to architects and to sculptors. If they had always been associated with them as they ought to have, we should not have now to notice as something remarkable the suggestion which her Majesty has so wisely made to the Committee. Now that it comes from the highest quarters it will, of course, be complied with, and the public may confidently leave the subject in the hands of gentlemen, who, by their education and course of thought, are qualified to entertain and competent to give opinions upon it.

BORING ROCKS.—A rock-boring machine, invented by Capt. H. N. Penrice (late of the Royal Engineers), is now being worked by Messrs. Hawks, Crawshaw, and Son, in the Claxton Quarry at Gateshead-upon-Tyne. It cuts a bore of 7½ ft. in diameter at the rate of from 8 in. to 13 in. per hour. This is far in excess of what is being done by drilling, with compressed air and blasting, in the Mont Cenis Tunnel, and it is a much less costly operation. Immense power may be applied on the principle of this machine, and a much greater rate of progress than the above may be obtained. It is well worth the inspection of all contractors and mining engineers.—*Engineer.*

LONDON-BRIDGE STATION OF THE BRIGHTON RAILWAY.—This company, in compliance with an order of the House of Lords, have reported that the number of houses inhabited by the labouring classes which they propose to take for the enlargement of their station, in the parish of St. Olave, Southwark, amounts altogether to 50; that the number of persons to be displaced thereby amounts to 398; that their bill does not propose to provide houses in substitution for them, and that there are plenty of houses and lodgings of the same character to be obtained in the neighbourhood.

FRENCH GALLERY, Pall-Mall.

THE ninth annual exhibition of pictures by French and Flemish artists is now open to the public at this Gallery. Without pretension to any subject of either high importance or startling originality, the present exhibition may bear favourable comparison, both as regards number and merit, with any of its predecessors. It has the indispensable feature—a picture by Madlle. Rosa Bonheur—which, although small, is as large as most of her recent works, and upon which this talented lady has bestowed more than ordinary care. It is entitled "Meadow Scene." There are still marks of haste in the thought and execution of the sky and mountains forming the background, but the animals are remarkably life-like, the character and expression of the heads especially so; and the herbage of the meadow, both in colour and detail, is an admirable example of natural truth, and an excellent lesson to English painters who are labouring under the pre-Raffaellite delusion.

Another talented lady, whose works the public have learned to admire at this Gallery—Henrietta Browne—has so changed both her style and subject, that, in all probability, "The Interior of a Harem" by her may pass unnoticed. But to any one who recollects her mode of executing some of her religious interiors, this is really the most extraordinary picture in the present exhibition; and although as a subject it is of little importance, still, as a proof of how much thought and character can be thrown into, in itself, so uninteresting a subject, this picture deserves great commendation. It might be called, were it not for the Turkish costume, "The state chamber in the Castle of Indolence." A female flute player is favouring three sultanas with a solo on the flute, who, seated on soft cushions, pay a kind of absorbed inattention to the music; one lays her hand on her heart, as if the air had awakened some faint remembrance of early happiness. A guitar girl lies on the floor amusing herself in tickling a sleepy tortoise into motion; another girl, standing over her, watches the process with a lazy and listless smile, and the only person apparently capable of lively and quick intelligence is a charmingly painted handmaid, leaning with her back against the wall, in attendance on the sultanas, and following with her eyes the fingers of the flute player. The whole is both elegantly drawn and charmingly painted, but, as we have said, to fully appreciate the varied powers of Madlle. Browne, it is necessary to retain a clear recollection of the excellent but varied pictures which she has previously exhibited.

A melancholy reminiscence occupies a prominent place in the Gallery. It is by the late Décamps, which death prevented him from finishing. It is entitled "Truffle Hunting." The subject is far from attractive, but it is treated in a broad and picturesque manner, which, combined with a rude and masterly grandeur, gives it a tone of elevation approaching the poetical. It is, in its unfinished state, also a valuable hint to young artists on the preparatory stage of such a picture, and would have been still more valuable had his widow, who exhibits this sketch, sent a finished work to hang by its side, and show how so imaginative a painter carried out his first conception of his subject.

Meissonier occupies his usual place over the mantelpiece. Of his three pictures, the "Corps de Garde," having several figures, is the most important. All the persons present are playing or watching a game at cards. The faces are admirably painted, the features having the easy play of nature, and the expression is so varied and true that it is quite easy to suppose what each soldier would say if he were to speak. The amusement to the spectator is still further increased by the contrast between the two gamblers, a young soldier against a veteran. The latter has evidently the best of the game, and scarcely cares to conceal his triumph, while the former looks at his cards with a bewildered air, and seems to anticipate defeat. The painter has placed his point of sight rather high, after the method of the Dutch school, which enables him to show more of his figures; but, small as the picture is, it is painted with a firmness of pencil entirely his own. "The Flute Player" is one of those quiet little subjects which he renders so naturally and so well, to which the theatrical attitude and bold laugh of a stroller, partly dressed for "Punch," forms a lively and spirited contrast. Louis Ruyter, the worthy pupil of the above celebrated painter, exhibits a very clever and highly finished picture, entitled "Soldiers at Leisure," a different name for a similar subject; but although the expression and attitudes of the figures by the pupil are nearly as excellent as those by the master, there is a coldness of tone, which, if somewhat refined as regards style, is scarcely suited to the subject.

Plassan is elegant in design and delicate in treatment, as usual, in his pictures of "The Bath" and "The Chocolate." They, however, do not display that careful finish which we have seen on former occasions, particularly about the neck and shoulders of his principal figures. The gracefully turned neck and throat of an elegant woman is a very beautiful object, and will defy the powers of a pencil unless wielded by the hand of an accomplished painter. Antoine Emile Plassan, with the opinions peculiar to French painters, may presume, and with some reason, that almost anything will satisfy English buyers; but French artists must be warned that when they paint down to the amateurs of this country, there are critics who know that there is anatomy in the female form as well as in that of the male, and that the due expression of it is much more delicate and difficult.

Lambinet sends six landscapes, of his usual size, but, from their general appearance, we much fear that hitherto chaste and delightful artist is also degenerating into what he has, perhaps, been told will suit the taste of the English collectors. Formerly the landscapes by Lambinet were not only admirable for their learning, but also for a charming sentiment of rural freshness and elegant repose; but we think his contributions this year, while probably possessing the same skilful arrangement, are comparatively

raw in colour, and do not tempt the attention further than to discover that parts are still admirably painted, but that they do not contribute to a pleasing whole. The shipping pieces by Jules Noel are, on the contrary, very carefully treated in every respect, and are, besides, very elegantly composed. The "View of Recamps" is especially quiet, and in the picture entitled "Low Tide" the group of ships in the distance is delicately coloured and gracefully arranged. Isabey is as dashing as ever; indeed, we think more so than usual, for in his "Ascending a Pass"—a carriage ascending a hill in a picturesque old French town—in the dash and daring of the moment the houses are represented tumbling about as if there was an earthquake; besides which, in that picture and the other, the "Port of St. Malo," the tone of colour is so heavy and cold, and the dark parts so sudden and black, that both pictures have the appearance of being unfinished. The pictures by Carl Joseph Kuwassag deserve to be ranked among the elegant and well-painted productions in the present exhibition. Two of them are entitled "Landscape," and the third is a "View of Ryde, Isle of Wight." "The Breakfast in the Fields," by Dillens, is an admirably finished picture, without losing the easy and free expression of the features. "Preparing for Breakfast," by Gustave Castan—a servant lost in thought, while the milk boils over—is equally well executed. In contrast to the soft and edgeless style of Plassan, the crisp and firmly touched very little picture by Chavet—a lady dressing, and reflected in a cheval glass—deserves notice. Darger exhibits six of his excellent domestic scenes in humble life. There is much pretty feeling displayed in "The Convalescent," where all the family are assisting in placing the arm-chair, and otherwise preparing for the sick boy. "The Naughty Boy" is receiving punishment from his mother, and, by his attitude shows that he is likely to deserve it, but also that it is just as likely that it will have no beneficial effect upon him.

"The Latest Arrival," by Langee, is another of the homely interiors which the French artists manage so cleverly, not only as regards treatment, but in the consistency with which they give unity to their subject, by concentrating the attention of their actors in the scene on the leading and most interesting object. The focussing of the point they with equal skill assist by the help of the strong colours and large mass of light. In this picture the woman nursing the newly-born baby, for that is the "latest arrival," with the children and young father looking at it, are all brought together in the foreground directly opposite the window, which gives the principal mass of light. The luminous effect of the light coming in at the window is contrasted by the half shadow into which the rest of the room is thrown, particularly that part of it occupied by the bed, where the mother is sitting up, who is also looking at the baby. This large space, being necessarily cool in tone, appears, perhaps, rather blank; it, however, gives a sense of repose and an impression of poverty suited to the scene; but the point of skill to which we wish to direct particular attention, is the manner in which the local colour—the real colour of a basin of milk she holds in her hand, uninfluenced by positive light or shade, compared with the white representing the light coming in at the window, renders it luminous, and in order that this small spot of local colour shall have full force, the kerchief round the head of the mother and her white night-dress are kept down considerably below the reality, and fall into the large mass of pure half shadow already mentioned.

With respect to the management of a large mass of white, two pictures may be compared with advantage to the young student—we allude to "The Morning," by Gustave de Jonghe, and "The Young Family," by Jean Baptiste Trayer. In each of these pictures the principal figures are dressed in white. In the latter the muslin dress is supported by a light and delicate blue, the whole mass being surrounded by furniture of a low-toned warm tint; and the white dress in the former picture is supported by the yellowish dress of a little girl, and a powerful contrast is found in a dark green cushion close by. In this picture we think there is too much white, but they are both very delicately painted by skilful artists, and afford, as we have said, a good opportunity of making a comparison with advantage. In the "Young Family" there are, besides, not only some heads beautifully painted, but infantine action most delightfully true to nature.

Returning for a moment to the point from whence we started the lovers of exact imitation, without "o'erstepping the modesty of nature," will have much pleasure in observing how Rosa Bonheur has, in her small picture of cattle in a meadow, rendered the effect of dew glittering on the grass, while the slight and varied character of the grass itself may be admired as a truly painter-like and legitimate method of executing detail of that kind; while the heads of the animals present, as we have said, a remarkable resemblance to life, will also deserve approbation.

It is not often that obedience to the rules of composition can be made to produce a comic effect, but we found an instance of it in a very clever picture by Frere; we allude to his "Mat Makers"—two old women sitting in the same position, or nearly so, and rather hump-backed in appearance. Now, two objects so remarkable require a third of a similar kind to prevent sameness, and the artist has ingeniously introduced a cat in the foreground—so what it loses in size it regains by position—setting up its back at something it is supposed to see on the floor, and thus three round-backed objects are obtained as, in this instance, required by the rules of composition.

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post*. Gold watches, 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enable persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 & 34, Ludgate-hill, 46 & 47, Cornhill, London, E.C. Established 1749.

ON SCULPTURE.*

OF all the fine arts which have form as their means of expression, sculpture is the most limited in its extent and material, its exhibition being confined to character and form. With these two specialties it must effect all we can desire—form, of course, being the vehicle for character. Difference of form gives difference of character. The human form is the highest, and, as such, the best medium for conveying the loftiest impressions of character, and is employed fitly to convey to our understanding the highest attributes of the Divine Being and of nature. The art of the ancients was as near perfection as it is possible to come, because it was conducted on principles now lost—principles which may be again restored and applied when the advanced state of society demands them. The art is at present, however, equal to our power to appreciate it; anything beyond this would simply be regarded as an object of curiosity; for the highest degree of intelligence manifested in a work of art interests but the few, and these are not necessarily the learned, scientific, or literary, but kindred spirits, with or without those adventitious accompaniments. The circumstances most favourable to the development of art of the highest order, concurrent with science and learning, and mingled with our literature, institutions, political and religious, are such as exhibit themselves in a desire on the part of the masses to be acquainted with the beauties of these refining agents of civilisation.

The fine arts exhibit the inventive power of man, and manifest themselves through three distinctive agents—form, colour, and sound. By these means certain fleeting graces of thought are rendered permanent and transmittable. A perfect imitation of a natural aspect is impossible, and if it were otherwise it would not be art. The fine arts deal with great abstract notions; things which have no sensible existence, but which belong to a higher and more exalted state of being, as equality, justice, goodness, wisdom, and beauty. Of these, beauty is entirely appropriated by the formative section of the fine arts; with this witching essence they captivate, whilst they inform us of all that the Creator has done for our enjoyment through the medium of form and colour. Beauty, then, is a principle in art. The artistic feeling is the power of creating agreeable emotions. The laws which govern or direct these are called aesthetic. Genius is the power to make new combinations out of existing materials, in imitation of nature, which is the operation of God's laws. The fine arts alone minister to the soul; they combine to give all the soul is capable of enjoying whilst connected with the body, and, to relieve it from the humiliating contemplation of its temporary associate. Fine art, as an abstract idea, can never be the subject of individual representation, and therefore perfection is an impossibility; and the extent of success in the pursuit is only the measure of individual capacity. But a soul was given to man; the fine arts alone minister to it; they are not appreciated by brutes or by brutal natures. Those who have no soul can live without them, but not so those whose souls are awakened to the consciousness of its high privileges; such beings demand, as with an appetite, the exercise of one or more of them; in the absence of this enjoyment life becomes a heavy, sorry business, indeed, but the fine arts give us a foretaste of a happy future whilst we sojourn in this world.

Necessity gives rise to style in kind and in degree; it is regulated by the conditions of the materials employed for its display; for instance, metal might exhibit parts and action which would be inappropriate in stone; in like manner, works in wood, plaster, clay, &c., present each special difficulties not to be met with in the others of the same kind and extent. To master any of those special modes will tax the ingenuity of the artist, and it is but fair to judge him by the degree of success attending his efforts. This is one clear reason why it is impossible to attain perfection in art. Moreover, any attempt to imitate one mode by the means proper to any of the others results in defeat, and it then becomes inferior to that of its own proper mode, which had invention exhibited in its production. Statues were at first sculptured in wood, then of baked clay, after this metal was employed, but statuary in marble was of the latest period. Landmarks or terminal pillars were first used at places of assembly, such as market-places, &c. A knob or head was put to the pillar, and the human countenance, with a leafed cap (now known as the "wide-awake"), was soon added. In this we find the origin of statuary sculpture. When the terminal pillar was placed in the market ground, a purse was carved on the front of the pillar, to indicate the nature of the commercial transactions to those interested. After this we find a hand introduced, holding the bag or purse, and in process of time the sculptor's art completed the idea, by making the pillar into the figure of a man, with the symbols of traffic and dispatch proper to those who make a journey to buy or to sell. The cap, feet, and staff have spread wings attached to them, to indicate speed in travelling, and sometimes a fleece or a ram is put at the feet of the statue. It is under these symbols, known as Manhood or Mercury. What were called household gods were once common, and were made of wood or of metal, and sometimes of baked clay; but when sculpture attained its highest development, the most lofty sentiments were embodied, with a degree of skill unapproached in modern times; but when religion was to be served on a magnificent scale, sculpture reached and surpassed the highest expectations, in its boldness, skill, taste, and profuse ornamentation. The Jupiter Olympus may be cited as an instance—the Minerva of the Parthenon as another—of the success attending their production. The art execution of the statues themselves being superior to the accompanying display of the gorgeous enrichments united, they were said to have no parallel in their magnificence. The sculptor's art was revealed in gold, ivory, silver, bronze, ebony, and precious stones.

The statue of Jupiter Olympus was sixty feet high, seated on a throne of ivory and ebony, inlaid with precious stones. This statue touched the roof of the temple with its head. The figure itself was of ivory and gold, with an enamelled crown of olive on the head, and an image of Victory on the right hand, with a burnished sceptre in the left. The drapery and the sandals on the feet were embroidered with flowers, particularly lilies, and the figures of various animals. The Minerva of the Parthenon was thirty-nine feet high; the naked parts of the figure were made of ivory, the drapery of gold, and the eyes of precious stones. There is a Victory, four cubits high, in her hand; at the bottom of the spear lies a dragon, and carved on the base is the nativity of Pandora.

There are two subjects in connection with sculpture which have afforded some interesting discussions amongst the *dilettanti*, both lovers of art and artists—namely, on painting statuary in life colours, and on the most proper mode of treating sculpture if in action or repose. But good taste rejects coloured statues, either in wax or any other material; the abstract qualities of form and character

are the only things sculpture as an art exists for. If sculpture were in natural colours we should then feel disappointed at its not moving also, for both belong to life. But a painting, though coloured, is not meant to deceive us, whilst statuary is fixed in position and gaze. The questionable taste which would have statues coloured, objects strangely enough, to the display of rapid muscular action in sculptural representation. This, indeed, would be absurd if the statues were coloured. But, says the critic, if the action exceed the tenth part of a second in duration, the action cannot be seen, and therefore it is impossible to represent it. So it would be if the art were limited to the specialty of limitation, but limitation is only a means of art. In action, however rapid, nature does not wait, but leaves it to the artist to reconcile us to the truthfulness of the representation of the action. This has been done with perfect success by the artists of antiquity, and the representation is as much of a real action as the material employed is living matter; and it is so far natural that the action has occurred as truly as that its representation lives; it is as much a real action as the form is real nature; both are alike suggestive—and art is nothing more. On the other hand, certain critics object to any kind of action, and assert that the only state which is satisfactory in sculptural representations is sleep or death. Now, these conceits would be tolerable if we were found, when asleep or in death, that we became marble, or metal, wood, &c.

Alto-relievo is high relief, or figures nearly detached from their ground, and is little different from statue sculpture. Basso-relievo is low relief, and quite different, being more allied to painting; it is outlined on a smooth surface, and sunk to a certain depth or ground, as in carved mouldings.

Rome produced few or no artists; they were too much engaged in war. The Roman general, Mummius, is said to have filled Italy with the sculpture he carried away from Greece; yet it is thought their absence would scarcely be felt. Though Nero plundered Delphi of 500 statues, it has been calculated that more than 2,000 were still left. 3,000 statues were brought to Rome from Rhodes, and Mutianus carried away as many from Athens, and even more from Delphi and Olympia. The Greeks alone were the people who gave to statuary its high character, as an art, capable of reaching the sublime and heroic without magnitude; they relieved it from the subordinate position as ornamentation or as symbols of state power; they alone cultivated and brought to perfection the high art of the sculptor. The career may be divided into five periods—namely, the primitive, ending with Phidias, 400 B.C.; the historic, ending with Alexander, 300 B.C.; the ideal, ending with Augustus; and the Greco-Roman, ending with Hadrian.

The education of the sculptor, after the manipulation of clay, the use of the chisel, and the capabilities of the several materials employed in the art, should, amongst other things, embrace the following:—Drawing, modelling, designing, plane and solid geometry, comparative anatomy, the laws of statics, equilibrium, balance and motion; the relative proportions of the human body, at all ages and of both sexes; the nature of drapery, and its use; light and shade; also the effect and the leading features of architecture, with its history, as well as that of sculpture and painting; ancient and modern universal history, and that part of its literature which relates to his art; national and local peculiarities in religion, policy, and the arts; and know pretty well what has been done before his own time; to distinguish between high and ornamental sculpture, with the artistic arrangement of proportional quantities in composition.

The fifteenth and sixteenth centuries produced some good sculptors, but none of the highest order; Donatello, Ghiberti, Cellini, Michel Angelo, and Bandinelli, alone make a respectable Italian school.

Gothic art in the main is simply ornamental, and takes its place as subordinate to architecture, which it enriches. Hindoo sculpture is pretty much the same, but has more of decided symbolism, with this difference, that the art seems stereotyped; it is no better nor worse to-day than at the earliest period. The forms, though conventional, are of a pleasing type. Of modern sculpture I must say that it is progressing, but its high price is a great hindrance to its success.

SALE OF FLAXMAN'S WORKS.—The *Critic* says, with reference to the sale by Messrs. Christie and Manson of the drawings and remaining works of Flaxman. Those who did not know Flaxman before would certainly not form any very exalted opinion of his genius from these remnants of his study. There was no work in marble of the least importance; we noticed one bas-relief of good style, called an assassination scene, in which a group of the four assassins was very finely designed in relief, and the action of all the figures was forcible, if not altogether natural. The designs for monuments were all very poor and common-place, and the same must be said of the greater part of the figures. The sketch books, and books of finished drawings of Æschylus, of the Iliad, of Hesiod, for Blake's engravings; of "Oberon," of Dante, of Milton's "Paradise Lost," and illustrations of the book of "Ezech," with the "Acts of Mercy," were the most interesting; but in these there was a very general want of the finish expected in these days of illustration. The sketch books contained very few original designs, being generally full of his studies in Italy from the antique and the renaissance sculpture to be found so abundantly there. None of these, however, could be pronounced a really careful and conscientious study of the original, although the character, especially in the antique studies, was extremely well seized as well as the action of the figures. One book contained some good and interesting drawings of a bas-relief in the Accoromboni Palace at Rome, the subject of which was Orestes and Pylades, or rather of Iphigenia. Throughout these drawings there is noticeable that great familiarity with the antique, up to a certain point, which was, in Flaxman's time, regarded as something wonderful. To us, now that we have had the greatest works of Phidias before us so long, with many other examples of antique art unknown in Flaxman's time, there seems to be too much adherence to the antique, and too little study of nature in all that our famous sculptor did. Even taking the larger view of Flaxman's works, which is to be got by a knowledge of his monumental sculptures, and those of his models which are in University College, we are disposed to think that modern English sculpture has not receded since his time. The catalogue stated there were 600 drawings, being first thoughts and finished studies. A considerable sum has been subscribed with the view of securing some of the best drawings to be added to the interesting collection at University College.

THE WIDOWS OF ROYAL ACADEMICIANS.—The Royal Academy has resolved to advance the allowance to the widows of academicians and associates from £75 per annum to £100 in the first class, and from £45 to £75 per annum in the second.

* Substance of a Lecture delivered at the Mechanics' Institute, Dublin, by Mr. HENRY McMANUS, R.I.A., reported in the *Dublin Builder*.

NEW COURTS OF JUSTICE.

OUR readers are aware that the question that this (Money) Bill be read a second time was lost by a majority of two, there being 81 for, and 83 against, the second reading. The decision, however, must be regarded as leading only to the postponement of a measure, which will in all probability be carried next session. Mr. Cowper gave an explanation of the provisions of the Bill, though he had already done so upon its introduction. In 1860 a royal commission sat upon it, which, after taking evidence, made a very able report, in which they recommended that measures should be taken for concentrating all the courts of law and equity—an object which, he would add, had met with general approbation. It was felt that the present state of the courts of law and equity was exceedingly unsatisfactory. Their arrangement had not been deliberately proposed, but was the result of accidental circumstances. The distance of the courts from the offices, and also from the chambers of barristers, was a source of the greatest inconvenience. It was also as a legal reform, tending to promote the much-desired fusion of law and equity, that this scheme was pressed upon the House. The reason for dividing the Bill into two was that they were obliged to take private property, which would involve inquiry up-stairs. The Money Bill was drawn to empower the expenditure of £1,500,000, which, realised, might be estimated at £1,400,000; and the Bill stated that whatever money was expended under the operation of its provisions was to be voted by this House. When the courts were erected, the premises now occupied in Chancery-lane and in Southampton-buildings, and also the probate registry, would no longer be required, whilst the site of the present courts would be disposable, and might be turned to profitable account. Considering the annual value of the charge for buildings at present used, he estimated that the proposed plan would result in a large saving. The operation of the Bill would not throw any charge upon the public to supply the dividends at present paid out of the funds of the Court of Chancery. What the public were called upon to do was to give a guarantee that in the event of these two funds being required the amount would be taken out of the Consolidated Fund; but he did not think that the guarantee was an alarming one as to its practical result. It was extremely unlikely that any charge would fall upon the national funds; but under any circumstances £45,000 was the maximum amount which could become chargeable upon the revenue. Then came the question whether it was a right course in itself to pursue, to take these funds from the object contemplated. He argued that it was. In the first place there were several precedents for the step. Buildings in Chancery-lane and the Masters'-offices in Southampton-buildings were purchased out of a similar fund. The Insolvent Court had also been enlarged at the expense of certain funds of a similar kind in the Insolvent Court. The Irish Four Courts had also been built out of the Suitors' Fund lying in the custody of that court. In the next place, the appropriation of these funds would occasion no injustice whatever to any one. No living person had any claim upon them. Moreover, Acts of Parliament had been passed at different times, authorising the Chancellor and the Accountant-General in Chancery to invest the sums accumulating from the fees, and it was therefore competent for the Legislature to decide what should be done both with the accumulated interest and principal. He did not conceive that any opposition could be raised to the measure on the ground of its interfering with existing interests. The only opposition which he anticipated was that which was announced in a petition from the Honourable Society of Lincoln's-inn. That society had put forward a proposal for erecting the courts in Lincoln's-inn at a cost of £100,000, on the condition that they were to receive interest out of the proceeds of the Suitors' Fee Fund, at the rate of £4,000 per annum. The difference between that proposal and the proposal of the Government was that the latter intended to take the principal of the fund instead of the interest, and to guarantee payment of the interest instead of receiving it. Under these circumstances, he did not see that the Society of Lincoln's-inn could raise any objection to the principle of the measure. There was another question with regard to a schedule, but that was a matter wholly for the consideration of the select committee to which he (Mr. Cowper) should propose to refer the Bill, if the House should agree to the second reading. There were reasons why the courts of justice should not be in the hands of a private body; but, on the other hand, he thought the House would be of opinion that there were several grounds on which it was desirable to erect a Palace of Justice, where the whole of the legal proceedings of the country should be carried on, in the very centre of the legal district. If the Bill passed into law, the right course to be pursued would be to appoint a commission to inquire into what courts and offices should be provided for, and to invite all the eminent architects in the country to furnish designs for the building. With respect to the cost, it was loosely estimated at £730,000 for the land, and £720,000 for the building—total, £1,500,000. This was £100,000 more than the funds disposed of by this Bill; but he thought it very possible that, when the matter came to be minutely considered, it would be found that £1,400,000 would be sufficient for the purpose. Even, however, if the additional £100,000 should be required, the saving effected in other ways would more than compensate for the outlay.

SUNDAY WORK IN PARIS.—The *Ami de la Religion* has received a communicated note from the Ministry of the Interior, in reply to an article which it had published on the subject of the desecration of the Sabbath in Paris, and expressing regret that the example of such violation should be set by the State, the department, or the city, which every Sunday, the article declared, occupy an army of workmen in labours the least urgent. The Ministerial note denies the correctness of the statement, and declares that, on the contrary, no labours are carried on but those which are absolutely necessary. The works at the Opera House were one of the cases mentioned in the article, and to that the note replies that the new buildings are on ground containing considerable springs of water, which require to be constantly drawn off. That operation and the earthworks which are the consequence of it are therefore necessarily carried on without interruption, night and day. No State works are continued on Sundays except when exceptional circumstances render that course absolutely indispensable. The contractors for the works of the city are under an obligation to discontinue their operations on Sundays and fête days, and all the contracts contain a clause to that effect. With regard to the contractors for demolitions, says the note, they make themselves liable to a fine of 300f. if they continue their operations on Sundays and fête days.

ADDITIONS TO THE LOUVRE COLLECTIONS.

IN the gallery of Apollo glass cases have been arranged on each side of the window looking on the quay. They contain very curious specimens of goldsmiths' work of the middle ages. In that on the right is the chalice of St. Potentian, Bishop of Sens, and in the one on the left are coffers, abbatial and episcopal crosses, enamels of the sixteenth and seventeenth centuries, &c.

The Egyptian Museum has just received a donation as remarkable for the beauty of the objects of which it is composed as for the rarity and scientific interest attached to them. This present is from a Polish traveller, Count Tyszkiewicz, who collected the objects during his researches in Egypt. The first class comprises 140 bronzes, among which seventy-six small figures are particularly remarkable. They represent the various gods of the Egyptian Pantheon, and their fine state of preservation allows the gold inlaying, which so much enhances the value of such works, to be properly appreciated. The small figures of the gods Anhour, Ptahub, and Cnouphis, and of different goddesses, are fine specimens of that kind of workmanship. Most of those objects bear inscriptions, which leave no doubt as to the name of the personage represented. Some of those divinities are very rare or even quite new to science, and several others, hitherto only known by paintings, are wanting in French collections. In that class may be mentioned a large snake in bronze, 28½ inches in length, a god with the head of a crocodile, and a personage whose head is surmounted by a star. The collection of Count Tyszkiewicz contains a great number of scarabæe, in hard stone enamelled. All these small objects supply fresh information for science by either furnishing variations of the names of kings and princesses, or a history of personages who had performed an important part under some of the Pharaohs, and thus deserve a place in history. There is also an ivory palette for a scribe, furnished with its reeds, and with two cakes of red and black ink, scarcely touched. The reeds are cut at each end, one for the red and the other for the black ink. A knife of yellow bronze is remarkable for its fine form and for its keen edge. Work in precious or hard stones is represented by three small objects of great beauty, and may serve as points in the history of the art, as each bears its date. The most recent is a square amulet in green sapphire, which bears the name of a functionary in the time of Osorchon I., who reigned in the ninth century before the Christian era; the head of the goddess Hathor is engraved in relief on this object. A pendant of a necklace, the material of which resembles chrysoprase, represents a Nile goose lying down; the lower surface bears the name of the Princess Neferou-ra, daughter of Toutmes III. This jewel was, therefore, cut at least 1,500 years before the Christian era. Engraving in relief on hard stone was, however, executed in Egypt at a much more distant period, as is proved by a small square amulet in sardonyx, bearing at the back the name of Auenemtré III., of the 12th dynasty. This king, who is well known as the founder of the famous labyrinth, belonged to the powerful family which covered Egypt with its monuments from Tanis to the bottom of Nubia, before the invasion of the Shepherds. At the back part of the amulet the king is represented as overthrowing an enemy. This scene and the Royal motto are incised. On the other side is engraved, in relief, an Egyptian named Harbes, seated before an altar. Notwithstanding the small size of this sardonyx (about half an inch), there can be clearly recognised the style peculiar to that fine period of Egyptian art. There is also among the collection a fine specimen of a coffin-lid, in yellow varnish; an earthen cup, enamelled in brilliant blue; and a wooden footstool, of a simple form, but valued for its preservation.

THE ACTION OF GALVANISED IRON ON WATER.

A. A. HAYES, M.D., in the *Mechanics' Magazine*, says:—Iron pipes covered with a firmly-adhering surface of zinc more or less pure, have been used as conduit pipes, under the received supposition that the zinc, by its polarising action from contact, will preserve the iron from corrosion, in the act of itself suffering oxidation. As the oxide of zinc, formed under some circumstances, adheres to the metal and encrusts it with a body not soluble in water, it has been assumed that water, passing through such pipes, would not become contaminated by either iron or zinc oxide.

Some months since, I analysed some well-water, which had produced a white deposit in the culinary vessels in which it had been boiled, and was itself turbid. The deposit proved to be oxides of zinc and iron with organic matter, and the water held suspended and dissolved organic salts of both these metals. On learning the fact that the pipes had not been long in use, a request was made that suitable precautions should be taken to avoid using the water in preparing food; and by insuring a large flow of water through the pipes continued for several weeks, the possible formation of a protecting surface was expected. But after long exposure in this way to much water drawn from the well, analyses of the water in the pipe and that in the well did not indicate any diminished action on both the metals. The zinc exposed to this water not only dissolved in it, but lost its usually observed power of protecting the less oxidisable metal in contact with it, and the quantity of salts formed from both metals was so large as to render it unfit for general domestic use.

Some weeks later I received a sample of water from a more distant town, the purity of which was suspected, and this was found to contain organic salts of zinc and iron also, although colourless and transparent. In this case the galvanised pipe had been longer exposed, and symptoms of anomalous disease in the family consuming the water, led to the chemical trials. The acid present in both salts appeared to be the cretic, and, in one case, traces of ammonia were found, constituting a compound salt. When the water was boiled, especially in metallic vessels, a white deposit of oxides of zinc and iron, with altered organic matter, appeared, but long-continued ebullition was required to insure complete decomposition of the salts.

The observed loss of protection in this exposure was deemed a point of much interest, for I had repeatedly examined iron boilers protected from corrosion by zinc surfaces, and have recommended this resort in numerous cases within the last thirty years, under varied circumstances, where the protection seemed to be nearly complete.

Mentioning these facts to my friend, Dr. Samuel L. Dana, of Lowell, he informed me that zinc surfaces failed to protect iron surfaces exposed to the flowing water of the Merrimac River, and showed me the result of such trials; the iron being much corroded both near by, and remote from, the protecting metal.

As the kinds of well-water which acted on the zinc and iron in these cases are quite common in every part of New England, it seems doubtful, in a sanitary

point of view, if such pipes are proper for conducting water generally; for, even when care is exercised, the metals dissolved in the water will surely be found in the food partaken of by families thus supplied.

I am aware that many persons consider both zinc and iron compounds when taken into the system as not actively poisonous, if even harmful, compounds of iron especially being found in the system. The chemical fact of the most importance in this connection is that the compounds of iron naturally found in the system are derived from compounds of iron existing in the food by the simplest transformation, and that other forms of combination will not supply these, and are active extraneous bodies which leave their marks on the stomach tissues.

In illustration of the activity of an iron salt when the dose is very minute, the effects of chalybeate waters may be instanced, and there are very medical men who have not witnessed the most surprising changes in the system induced by these, even when the ordinary preparations of iron have failed in their action. Now, in most of the ferruginous waters it is the crenate of the protoxide of iron which occurs—the same salt which the galvanised pipes produce—while the zinc is not found as the well-known oxide, but in the state of an active salt corresponding to the iron compound, and has no claim to consideration as a body forming healthy secretions.

TIMBER PROOF AGAINST THE WHITE ANT AND SEA-WORM.

THE *Australian Mail* gives some notes on a timber grown in Western Australia which is said to be proof against the white ant and sea-worm. It is commonly called "mahogany" in Western Australia, and it very much resembles that wood in appearance. The native name is "jarrah," and the botanical name of the tree "Eucalyptus." It has properties which make it peculiarly applicable for works in the Tropics, or on the sea-coast, viz., that neither the white ant nor the sea-worm will touch it, and that it suffers very little from exposure to the sun or atmosphere. It can be delivered in India or the Mauritius in picked logs, or in baulk (provided a quantity of not less than 200 loads is purchased at one time), for less than 4s. a cubic foot, and if arrangements were made for a larger quantity—say of not less than 400 loads—it might be delivered for 3s. 6d. a foot, or less.

The principal part of the timber trade of the colony of Western Australia is in the Vasse, from whence extensive shipments have been made to the eastern colonies of Australia, Ceylon, and some of the Indian railways. A quantity has also been supplied for Government works in the Mauritius.

The average consumption at Fremantle for Government purposes was about 500 loads per annum, and in 1856 a contract was entered into for the supply of a quantity of timber at Fremantle for 57s. 6d. per load. A small advance was afterwards made on this price, but since that time the trade has been extended sufficiently to allow of the employment of machinery, and the construction of trams for the conveyance of the timber to the port of shipment, so that the prices are much reduced. In cutting up the sand-grown timber, a waste of about 18 per cent. occurred. The loss in cutting up the logs from near the hills was not nearly so large as 18 per cent., as the cores of these logs were in general round.

The chief expense incurred in obtaining this timber is the cost of transport to the place where it is to be used. If the timber was brought in a quantity exceeding 400 loads, it would be worth while for the captains of the convict ships, about three of which per annum leave Western Australia for Ceylon or India, seeking cargo, to take it in as cargo for India, &c., and it is believed that in this case freight could be obtained for a little over £1 per ton. The charge for freight would probably not exceed 24s. a ton, or 30s. a load, which would be about 8½d. per foot—say 9d. The engineer of the Columbo and Kandy Railroad in Ceylon, said, in 1858, that he could afford to give £7 a load for timber fitted for piles, stringers, or sleepers; and since that time a considerable order has been given to parties in the colony, on account of this timber, so it is fair to presume that the price at Ceylon did not much exceed £7. The cost of these sleepers at Madras has been 10s. each, which is about the same as that of the Indian woods of the best class. It has been supplied to Adelaide, South Australia, and Melbourne, Victoria, in scantlings fit for railway purposes, for less than the price above estimated.

Captain Wray, Royal Engineers, says:—"As regards its properties, I have myself used upwards of 3,000 loads of it in buildings, jetties, and bridges, and I have examined timbers which have been exposed to the action of the white ant and sea-worm in situations where it could have been destroyed, if liable to destruction from either of these causes, and I never saw any penetration deeper than the sap wood, though deal, or other timber close by, was completely eaten away. This indemnity from destruction is generally attributed to its containing large quantities of gum resin. The strength and elasticity is about equal to Riga fir. This was ascertained by a series of experiments on beams, with a bearing of 12 feet, conducted by Mr. Manning, Clerk of Works at Fremantle. The weight of the timber makes it inapplicable to moveable joiners' work, such as doors or sashes; but the white ant, only working in the dark, will not attack these unless a building is left unoccupied for a lengthened period. I know of no objection to it, except that it is somewhat slow to season, and, if exposed before seasoned, will fly, and cast, perhaps, rather more than other timbers. The plan lately adopted in Western Australia to season it was to leave the logs in the sea for a few weeks and then draw them up on the beach, and cover them with a few inches of seaweed, taking care to prevent the sun getting at their ends. My experience led me to the conclusion that logs might lie in this way without injury for almost any length of time. Boards were cut 7 inches wide, and stacked so as to admit of a free circulation of air for five or six months before using."

The consulting engineer of the Madras Railway says "the wood is well spoken of by our engineers." The trial has not as yet been long enough to enable the qualities of the wood to be thoroughly tested on the Madras Railway, but the engineer says, in January, "that those placed on the road in July are in good condition at this date, and form an efficient substitute for teak in girder bridges." Some specimens now coming from Western Australia for the Great Exhibition will supplement this report in respect of proof of durability, both under sea water and in situations where it is liable to attack by the white ant, as there will be exhibited logs that have been in use as piles, &c., &c., for periods of from twenty to thirty years, without receiving the slightest injury.

ARCHITECTURAL INSTITUTE OF SCOTLAND.

THE Architectural Institute of Scotland have issued the twelfth report of the Council of Management, who say, that the Institute has been indebted during the past session for communications to the following gentlemen:—

I. Cosmo Innes, Esq., Professor of Universal History in the University of Edinburgh, Introductory Address, Subject, "Suggestions for the adaptation of Architectural Style to Place and Site."

II. David McGibbon, Esq., "Remarks on the Photographs of the Architectural Photographic Association."

III. John Lessels, Esq., architect, "An Inquiry as to the True Principles for our guidance in the Restoration of Old Buildings."

From the list of papers read, it might appear that there had been less than the usual amount of business transacted during the past session, this is not altogether the case, as there have been various subjects of public interest, or of interest to the profession, which have been before the Institute. In particular, for example, it may be mentioned that the operations at Roslin Chapel were the subject of discussion at repeated meetings of the Fellows; and the remonstrances of the Fellows against the pernicious consequences of these operations appeared in the newspapers at the time. The Council regret to think that Lord Rosslyn should not have yielded to the many representations which were made to him from various quarters on the subject.

Another subject which was brought before a General Meeting of the Institute, and was subsequently taken up by the Fellows, is one which has created much interest among architectural societies during the past year,—viz., the subject of establishing a course of study and examination for diplomas for architects. As this subject is still before the Fellows, and no definite conclusion has been come to by them, the Council cannot do more than say that it has met with a general approval—it being considered that at present the profession, for want of some test or another of qualification to join it, does not possess that status which it ought to enjoy.

The Council further state that, having been applied to on the subject of the Institute's joining the Architectural Alliance which was proposed of the various architectural bodies throughout the country, after several meetings, resolved that such alliance was desirable; and Messrs. John Lessels and John Dick Peddie, architects, Edinburgh, were appointed to represent this Institute at the meetings of the Alliance.

The International Exhibition of 1862 has likewise occupied a considerable share of the attention of the Council, who have been at some pains to endeavour to obtain such representation of the state of architecture in Scotland as might be worthy of the country. Whether it will be so remains to be seen; but the Council state that they understand that not more than about twenty architects in Scotland have applied for space. Messrs. David Rhind and Robert Matheson were appointed members, to represent the Institute in the General Architectural Committee in London, in connection with the Exhibition; and these gentlemen have taken considerable pains in order to obtain a representation of the works of deceased Scotch architects.

The honors offered by the Institute to apprentices were gained, last session, by the following young men:—

I. For the best geometrical drawing. Medals—John McGibbon, apprentice to Messrs. Baird and Thomson, architects, Glasgow; and Edward F. J. Clarke, apprentice to Mr. David McGibbon, architect, Edinburgh—equal. Second Prize—William Dothie Dobson, apprentice to Mr. Patrick Wilson, architect, Edinburgh.

II. For the best perspective drawing. Under this head was worthy of the distinguishing mark of a book—G. M. Moyes, apprentice to Mr. James Anderson Hamilton, architect, Edinburgh.

III. For a series of drawings from old buildings, measured and drawn from the originals. Medal—William Porteous, apprentice to Messrs. Bell and Menzies, architects, Edinburgh. Second Prize—John Thomson, apprentice to Messrs. Bell and Menzies. Third Prize—John Lawrie, apprentice to Mr. William Fairbairn, architect, Edinburgh.

IV. For the best original design—subject, a block of buildings for private dwellings. The Council have awarded the medal to James Souttar, draughtsman to Mr. James Matthews, architect, Aberdeen. The second prize of a book to William Young, apprentice to Mr. William Taft, architect, Glasgow.

In modelling, no prize was offered this session; but a book was awarded for the model of a cornice enrichment sent in by James Kennedy, 9, Sime's-court, Calton-hill, Edinburgh.

The Council have announced the following as the subjects of competition for the present year:—

I. For the best geometrical drawing, being an elevation of any existing example of Grecian or Palladian architecture—to be competed for by apprentices of not more than three years' standing of any Scotch architect.

II. For the best perspective line drawing of any existing example of architecture, projected and raised from the plan.

III. For the best drawings of a small portion of any ecclesiastical building—scale, 4 inches to 10 feet—with details one-fourth of full size; measured and drawn from the originals.

IV. For the best original design—subject, a church heltry in perspective—scale, 4 inches to 10 feet.

The 2nd, 3rd, and 4th to be competed for by apprentices or draughtsmen to any Scotch architect. Drawings under 3rd and 4th heads may be tinted.

The competition drawings to be lodged at the rooms of the Institute, Edinburgh, on or before the 1st day of March, 1862, accompanied by a sealed note containing the author's name, and bearing outside and inside a motto, and the head of competition under which it is to be placed. The motto on the letter to conform exactly to that on the drawing.

The prize drawings to be retained by the Institute.

In last year's report it was suggested to be desirable to adopt the suggestion of the professional members made some years before, that, in lieu of Transactions, the Institute should publish a series of lithographed engravings of select examples of buildings, ancient and modern. There have been some practical difficulties in the way of carrying out this suggestion, which was approved of at the meeting at which the report was read; and the Council have resolved that, for one year at least, the resolution to publish engravings shall be suspended, and they will forthwith issue another volume of Transactions.

From the abstract of the treasurer's accounts, it is gratifying to find that the finances of the Institute are in a good state, and, referring to previous years, are improving. This state of matters has principally arisen from a reduction of the expenditure in consequence of the change of premises.

The report is signed by Messrs. J. Dick Peddie, Chairman, and William Miller, Hon. Sec.

The Transactions of the Institute, tenth and eleventh sessions, are also published, forming the fourth part of the fifth volume. The part contains Introductory Addresses, by Professor Blackie and Mr. Cosmo Innes; a Notice of the Life and Works of W. H. Playfair, by Mr. J. M. Graham; and an Inquiry as to the True Principles for our Guidance in the Restoration of Old Buildings, by Mr. Lessels.

BODELWYDDAN CHURCH, NEAR ST. ASAPH.—MR. JOHN GIBSON, ARCHITECT

AN INQUIRY AS TO THE TRUE PRINCIPLES FOR OUR GUIDANCE IN THE RESTORATION OF OLD BUILDINGS.*

THE subject which I have the honour to bring before you is one of so much importance in itself, that I need not make any apology for its introduction. It will recommend itself to your notice by its own merits; and although what I have got to say regarding it is sufficiently well known to my professional brethren, yet, as our convictions may not prove alike, I hope that my remarks may lead to such discussion as will elicit your opinions individually, and prove the means of strengthening each other's hands when our aid is required in the execution of such work. Trusting, therefore, that you will find in these motives an excuse for my shortcomings otherwise, I will proceed without further preface.

It may appear, on the first glance at the question before us, that nothing could be more easily answered. It might be thought that if a building has fallen into decay from the wasting effects of time, or been overthrown by some of those eventful chances in our history which have laid so many of our finest edifices in ruins, it should be a simple matter to rebuild it as it formerly stood, the foundations, in most cases being extant; for although we might not be in possession of such facts as would furnish sufficient data to regulate the details of any single building requiring restoration, there may be other buildings of the same class still in existence which will afford a sufficient clue for our guidance. On closer examination, however, it will be found that the varied conditions under which every building has originally been constructed are so many and complex, that it is a very difficult matter to bring them again into action in its reconstruction; and, consequently, that any restoration must fail, in so far as it may not be in our power to comply with all the conditions originally brought to bear on it.

In an inquiry of this kind, it may therefore not be out of place to take a hasty glance at the past history of architecture, referring only, however, to those styles which have affected to greater or less degree the architecture of our own country.

In doing so, we shall find that men in early ages built merely to shelter themselves from the inclemency of the weather, and to find protection from those hostile to their interests—that as they congregated more and more together, and wealth increased, walls and towers were raised for the defence of the community, and temples for the worship of their gods—and that, from the smallest and rudest beginnings, architecture rose and progressed in its course, until it culminated among the Greeks, four hundred years before the Christian era, in such perfection of art as the Parthenon at Athens: a work which, for simple and majestic grandeur, has never been surpassed, and, even in its decay, has called forth the admiration of each succeeding age—an admiration well embodied in those expressive lines of the poet:—

'Alas! though perfect form of grace,
Once deem'd of gods meet dwelling-place!
Thou master-work of Phidias' hands,—
Thou boast and marvel of all lands!
Perish'd thou art; yet fairer so,
Than all that later art can show!'

Constructed of the finest marble of Pentellicus, with a precision that even yet defies the ravages of time, and adorned with sculpture so exquisite, that the very relics of it are now considered among the chiefest of England's art-treasures, it seemed as if Greek art had reached the climax in its production, and could go no further, for in the four succeeding centuries it gradually declined.

The Romans, with their conquest of Greece, appear to have imbibed so much of the spirit of their art, that, with the aid of Greek artists, they were able to form a style for themselves, which, although less refined in its nature, was even more gorgeous in its beauty than the Greek, lighter in its proportions, and more capable of being adapted to suit the wants of that luxurious people. This new style reached its greatest perfection, as exemplified in the Temple of Jupiter Stator, in the Forum, Rome, and in other buildings of that period, in the reign of the Emperor Augustus, about the commencement of the Christian era, and continued in use for about four centuries. At that time, as there had been previously in the Greek, so there was then a decline in Roman art; while the overthrow of the Roman empire by the Visigoths, and the spoliation of Rome, on two different occasions within half a century, must have seriously affected the further advancement of Roman Architecture; and, towards the end of the sixth century, we read of its total decline.

A new element had, however, been brought into action, for the Lombards, who were at that epoch in possession of the Roman States, working with their own ideas among the relics of the preceding ages, by degrees produced a new style, generally known as the Romanesque, totally different from either Greek or Roman, in which the columnar ordinance was not inharmoniously blended with Gothic forms. This style received considerable patronage from the Papal powers, whose influence at that time was great, and many beautiful examples of it yet remain.

But as everything in this world seems designed to be transitory, the semicircular arch, which had up to then formed one of the most distinctive marks of Roman Architecture, in its turn gave way to the Pointed; which, in the end of the eleventh and beginning of the twelfth centuries, we find mixed up with the semicircular, in the minor details, in France and some other portions of Europe, until, by some sudden impulse, which cannot now be easily accounted for, the Pointed finally superseded the former.

To turn now to our own country—we find little account of any buildings of note, except those raised by the Romans in the southern parts of the island; and of these we are merely informed of their decline in the end of the third century.

The middle of the fifth century was marked by the arrival of the Saxons; but very little of their architecture is believed to be in existence.

In 652, we have notice of the Bishop of Lindisfarne having built a timber church on Holy Island. At a later date, we learn that Alfred the Great did much to advance building and architecture. The greatest and most marked change, however, was that which followed the Conquest of England by William of Normandy, at the end of the eleventh century, at which time, or a little previous, the Romanesque, better known with us now as the Norman style, which, as we have already stated, had been in use a considerable time previously in Italy, was introduced into Britain; but with us, as there, it was only adopted to be superseded by the Early Pointed in the end of the twelfth century.

With the general introduction of the pointed arch, a great change took place in the principal features of our architecture. The horizontality of the leading lines in its composition which had prevailed from the Classical period downwards, had now to give way to the Perpendicular arrangement, which continued and formed one of the leading features of our Gothic architecture through its best periods, and was only departed from in its decline.

The Pointed Gothic, commencing with what we term Early English, in the end of the twelfth century, passed through all its phases, and became the architecture of this country for a period of somewhere above four centuries. It is gratifying to know that we possess excellent examples of all the different periods; and although they are of smaller size and less florid in their decorations, they will bear comparison, for beauty of proportion and elegance of design, with any of continental Europe.

Time will not permit, neither is it necessary here, to offer any definition of the varied changes that took place in the arrangement of the details and in the sculptural decorations, nor yet the time that elapsed from the end of one period to the commencement of the one following, which produced such beautiful variety in the transitional periods. These have been so clearly defined by Rickman, Sharpe, and other writers, that I may pass them without further remark. With the beauty of the details in moulding and sculpture, both in design and workmanship, however, we cannot be too much impressed, nor should we neglect any opportunity of studying them. Artists in those days worked without the cares and anxieties attendant on the prospect of an unperformed contract. The art-workmen, too, were also in many cases the designers; and thus a spirit of vigour and freedom pervaded their works which is entirely wanting in our modern productions. Each man's heart was in his work, and each, I have no doubt, vied with his neighbour whose labours should prove most excellent. Works were produced which have proved the admiration and instruction of ages past; and much of it seems, from the sound condition it is yet in, capable of enduring the ravages of time, and affording pleasure and enjoyment to future generations—a pleasure which seems now to be widely partaken of by the community, and not only so, but desired and understood. Those who have any doubt of this, I would ask to read those beautiful verses in the *Cornhill Magazine*, entitled the "Carver's Lesson."

I have now reached the end of the sixteenth century as regards our Ecclesiastical architecture. At that time it was subjected to another change by the introduction of the revived Classic or Renaissance, which the Quattro and Cinque Centists of Italy had carried to great perfection. The works of Sir Christopher Wren and Inigo Jones, with a host of others in this style, still remain to us; and although some of these are very excellent, yet it never reached the perfection here which it had attained in the Italian states, but, on the contrary, descended with rapid strides to that chaotic darkness which overtook architecture in the eighteenth century, when all purity of style and character seems to have been lost.

On the civil architecture of our own country (for we have a style of our own) much might be said, if time permitted; but I must limit my remarks to its general features.

It commenced with the lofty single square tower, which was increased in size according to the wants of its owner, ever keeping in view and providing for the best means of defence. It was solid and massive in appearance, with its solids enormously large in proportion to the voids. Altogether widely separated in its spirit from the Ecclesiastical Architecture of the same age, except in the later periods, it possesses a certain amount of grandeur and dignity of effect peculiarly its own; while, in the later examples, the variety of heights in the gables, its round corbelled turrets and high-pitched roofs, with their quaint dormer windows, give to it a rich and picturesque appearance.

Much of it was also good in execution, but the details and ornamental portions do not appear to have reached that perfection and delicacy attained in the religious structures, being in general overdrawn, rude, and quaint, and bearing much the look of having been executed by workmen copying from originals they did not quite understand or appreciate.

Such then, are the materials we have to deal with in the process of restoration—an Ecclesiastical architecture bearing in itself one connected chain of historical record from the end of the eleventh down to the end of the sixteenth century; and although few buildings bear evidence of being carried out to completion in the precise style in which they were commenced, yet there are some fine examples of such—Glasgow Cathedral, for instance—while many, from the changes they have undergone at different periods, contain in themselves examples of both the earliest and latest work—such as Melrose Abbey, where the whole are so agreeably blended, that it becomes a matter of research to know where one style ends and another begins.

Each building possesses, therefore, a value in itself, not only as a work of architecture, but an exponent of the wants and feelings of ages that are past, of which no other record may be in existence.

Many of them also, from the lapse of time and other accidental causes, present to the eye objects of such picturesque beauty, that poets and painters find in them a constant theme for the exercise of their talents, and they have now become so much enhanced in value by the associations that surround them, that one feels it to be desecration to interfere with a single stone, or even to remove one single stem of the ivy which threatens, in the luxuriance of its growth, to overthrow the very pinnacle to which it has clung in its aspirations.

If these Ecclesiastical remains have become so time-hallowed and precious, surely what we have of a civil and domestic character cannot be less so; but as restoration is the order of the day, we must now proceed to it with all alacrity.

Supposing, then, that we have now got well read up in our Archaeology as a due preparation, and made careful drawings of our subject—making ourselves familiar not only with its style, but also with the spirit that pervades the work—to carry on the operations will be our next step. But in this, the most important stage, I must now pause and ask your advice.

Let us, then, take up a case in point. The walls of the church that we have to restore had originally been well built in courses of squared stone; but have now in many places got dilapidated, and there are portions of them slightly displaced. The whole surface of the stone, more particularly on the south front, has become nhraded by the weather and discoloured by time; the joints have opened, and are now irregular, while the mass of the wall is sound; the under portions of the base mouldings are also wasted, and the under plinths of the basement have got displaced. Shall we recommend the base and wall courses to be

* A condensed report of this paper, read at a meeting of the Architectural Institute of Scotland by Mr. JOHN LESSELLS, F.A.S., appeared in our last volume; we now give the paper in *extenso*, from the Transactions of the Institute, mentioned in another page.

drawn out, the mouldings of the base to be re-worked, and the whole wall refaced with new stone, polished and close-jointed?

The jamb mouldings and tracery of the windows are in many places broken; the carved work wasted, as well as some of the mullions, while others are sound and good. Is it consistent that we should reduce the thickness of the mouldings, alter their profile to suit the reduced size, and have them re-worked, to correspond with our new ashlar?

I think I can anticipate a negative to both of my questions, and am afraid you think me very foolish to have asked them. Yet, is not this course followed every day? Have we not an instance of it in our own St. Giles' (Edinburgh). Do we not meet with it over the whole length and breadth of England? Are not some of the finest of the French cathedrals undergoing that process at present? Did I not see, only a few years ago, the beautiful Church of St. Ouen, at Rouen, scraped and cleaned, until the whole surface was spick and span new, from the pinnacle of the spire to the under plinth of the base?

With such authorities as these, can I not indulge my fancy also for scraping, whitewashing, and polishing up the front of my church equally with my neighbours? Don't you see how clean and nice the front of St. Giles' looks since it was cleaned? It is not a whit inferior to St. John's; it has none of the dirty, dusty, worn-out look about it now; and he would be a clever fellow, who, coming into our town, could discover the 'Auld Kirk,' where Jenny Geddes' stool played so conspicuous a part, if we did not aid him in his explorations for that pile.

These are the best arguments that can be brought forward in support of the case, but I fear you are still unsatisfied. I need not ask you, therefore, about the pierced parapet and pinnacles I intended to have introduced to your notice, for, I doubt not, these would be negative in like manner.

Perplexed, but not quite in despair, I think I hear a comforting voice whispering, "Each of those stones you would remove has an interest and beauty in itself. They are, in fact, the component parts of the building you would restore. You don't want a new building; you wish to hand down the present building in all its integrity to future generations, as the 'veritable building,' with its various associations, that has stood there for these six centuries past. You would not perpetrate a falsehood in stone and mortar, but if you adopt such measures, you may depend on it the verdict of every educated man would be, that you had been perpetrating falsehood with fraudulent intent, as it is to produce a fraudulent appearance that you wish to do it. Remember that the want of truth in any building, as in man or woman, ultimately and effectively destroys all the interest otherwise attached to it. No other quality, however brilliant, will compensate for the want of truth; and, as one of our greatest earthly enjoyments consists in the entire confidence we repose in those we love and trust, so our greatest disappointments arise from the want of it, and we turn in like disgust from sham and pretension in one thing as from all.

If you would be an honest restorer, you must be content to follow closely in the footsteps of the original designer, not only in the spirit but in the letter, assimilating both the drawing and the workmanship to the original as far as it is possible so to do, carefully preserving all that can be preserved, adding nothing, taking nothing away. Where walls are loose, and the cement has lost its hold, the best thing you can do will be to take them down in small portions, and have them rebuilt by careful workmen, laying every stone again in its own place, and making it imperative that they shall by no means destroy the original surface: rather leave jamb or arch moulding untouched, although these may be a little wasted, if their security is not otherwise affected, than insert new for the sake of a fine surface. It would be ill-spent time and labour wasted, to put in new work merely for the gratification of those who could not appreciate the original work. Their opinion is not worth valuing.

Window tracery is of so fragile a nature, that it may often require restoration when little more is needed; but if such has to be resorted to, it ought to be carefully worked to correspond in every way with the original. As much of the beauty of an old building often lies in the weather-staining and colours of the mosses and lichens on its surface, these should be preserved with care, except in such cases as they may be found to be injuring the building. Where the joints of the masonry require filling up, all unseemly patch-work should be avoided, as nothing is more offensive to the eye of taste than to see a picturesque old gable scarred over with patches of white mortar, or a black and oily cement, of which, as well as whitewashing, we have had too many examples.

Now, as the principle which guides us in the restoration of a part is equally applicable to the whole, I need not waste your time going further into details in this case. There are, however, cases in which we may be compelled to adopt another system in carrying out our restorations; but in Scotland these will prove the exception, not the rule, although in England it is painful to observe how very frequently they occur. I allude to those buildings where the stone is of such a friable nature as to crumble away rapidly under the influence of the weather, as you must all have seen, where carving, mouldings, and all trace of workmanship disappear, and a rude and shapeless mass of wall only is left.

When such does occur, the very safety of the building becomes endangered, and there is only a choice left between two evils; and however unwilling, you will be compelled to adopt the method first suggested, of cutting out every stone and replacing it with new. But the same principles that we held to be the rule for our guidance in the first case must also apply to this, let the new work be made a counterpart of the original in its whole style and detail.

I may mention, before proceeding further, that it is sometimes our lot to meet with some late and inferior work attached to, and destroying the character of, the early work to which it has been added. When this is the case, I think there need be no hesitation in at once removing it, and restoring the parts to their original condition; but such cases must inevitably be left to the judgment of the party employed in the restoration.

Again, we are called upon to examine a church of the fourteenth century, which is all sound and in good repair, and has long been used for the parish church, but which now, from an increase of the population, is insufficient for the accommodation of the worshippers. The hearers also complain of the pillars between the nave and aisles being in the way, the windows too small, and that the church is somewhat dark, and altogether not well suited for the present mode of worship.

How are we to deal with it? The answer to this would be very simple, if money were no consideration; for we then would recommend that a new church should be built, and the old allowed to stand as one of the landmarks of its generation. But in those days of utilitarianism, that answer would find little favour among the generality of heritors of parishes, who probably, before they came to

consult you, had made up their minds what sum they intended to expend, and only asked your assistance from some vague and undefined idea that you can help them to make a better bargain with their builder.

You may have heard, previous to these repairs being mooted, some individual heritor congratulating the parish on having such a fine specimen of that style of architecture, and telling how many, eminent as antiquaries and archaeologists, have visited and measured all its details; but now collectively you will soon find them ignoring all the charms of its architecture, in the desire to accomplish their ends with as little outlay as possible.

Your first thoughts, perhaps, are of pleasure in being the party selected to whom the work is to be entrusted, and you may be already considering with what a loving care you will go about it. You have not yet learned all the "secrets of the prison-house;" as yet they have only talked to you of architecture, and you are invited to go out and see the place, and meet the building committee; and then and there they put a damper on your enthusiasm, by acquainting you of the very liberal sum they have voted for the work, which you are also made to understand must cover the architect's charges. Possibly you now make up your mind to throw up all connection with the affair, and return to town as quickly as possible; but on second reflection you perceive that, if you won't, another will. You go to work with a heavy heart; for you know as assuredly as you have taken it in hand, that those very men who lay the onerous charge upon your shoulders without providing proper means for its fulfilment, will also take shelter under your name for all the shortcomings in carrying out the work; and you may, perhaps, have the pleasure of hearing them coolly telling their friends that architects don't understand these things now-a-days, and of the world of trouble they have had in getting their church put right. I have no doubt they had much trouble, but only in reconciling their principles to the state of the exchequer.

Well, as we find we have not the means to build a new church, we must make the money go as far as we can on the old one; and seeing it is a profitless and expensive process altering old walls, and contrary to the principles we have been inculcating, we shall allow these to stand, and make an addition, in the shape of transepts against the east gable. Possibly that gable may require to be taken down; we know that this was frequently done in the best days of Mediaeval work (which will be a sop to the sticklers for precedent). It is common sense that dictates it to us; for we believe in architecture being progressive, not, as some of its professors would have it now, stationary. We see also that, in those times, they did not hesitate to engraft the style of one period on that preceding it, when they could do so harmoniously; and as we have complaints of want of light in this building, were we to adopt a later style it may afford us more license and better meet the requirements of the day. This, however, you will observe, is not imperative—it is entirely optional. But we must take particular care not to injure or detract from the appearance of the old work; and while we preserve a true sense of the unity required in the composition, we must also endeavour to assimilate the new to the old, so that each may give value to the other, and that the character of the original work shall be enhanced and maintained so as to produce a satisfactory result. Of course we must take care that the additions, when completed, shall prove fit for their purpose, and as good as the circumstances of the case will permit.

Hitherto we have only alluded to restorations as connected with Ecclesiastical architecture, as it is, in fact, public property, in interfering with which some respect should be had to the feelings of the community. We can easily conceive what would be our annoyance and disappointment, after we had travelled some hundred miles to see and verify for ourselves the details of a church of some particular type, of which we had read, and found that our journey had been made in vain, the building having undergone the process of "restoration" by some heartless renovator, who had destroyed all trace of its identity.

It has been said that "every man's house is his kingdom," where he may reign supreme. (I suspect the author of that saying lived out of the reach of tax-gatherers.) If such, therefore, be the case, it will be evident that domestic architecture must be ruled by the taste of individual proprietors; but yet there are circumstances, which will readily enough suggest themselves to your minds, where the public may claim an interest in preserving a private dwelling, and that without lying under the imputation of claiming a right of roadway unrighteously. Where such is the case, public opinion, respectfully expressed, will seldom fail to command attention.

In carrying out extensive restorations or alterations on a dwelling-house, characteristic of any particular period of architecture, it will, in general, be desirable to adhere to that character in the new work as far as the requirements of the proprietor will admit. I repeat, as far as the requirements will admit; for as "fitness" ought to be the ground work of all good architecture, adherence to a particular style will not compensate nor prove an excuse for the want of it. The original designer, no doubt, contrived his plans to suit the wants of the proprietor, in the first place, and then built in the style of the age. It will not do, therefore, to neglect the major principle for the sake of carrying out the minor. You are making additions to suit the extended wants of the present proprietor; and the character of the new work ought, in like manner, to be an extension of the original style, to meet these demands. I cannot conceive a greater absurdity, than for a man, in the erection of a new mansion, to confine the size of its windows to the dimensions of pigeon-holes, to the exclusion of all the glorious benefits of sunlight, in the silly idea that he was carrying out the pure Scotch style, overlooking altogether its progressive character.

In carrying out buildings of this description, however, another question may arise, as to whether the details and decorations shall partake of the rude, quaint character of the original, or be made to harmonise with those of the present day. I think this question is very easily solved: for rude and quaint, nay, even puerile, as some of the decorations of our domestic architecture often are, you will generally find that they have the germ of something good in them; and I would consider the man unworthy the name of architect, who could not seize upon the spirit of the original, and carry it out, without descending to puerility, on the one hand, or destroying its character by over-refinement on the other.

I think it has been rather the fault than otherwise to copy literally those quaint old things, both good and bad. With this I have no sympathy, and would consider it no excuse—for the perpetration of something decidedly ugly, to be told that it was a facsimile of one three hundred years old. We have not yet advanced so far in art as to be able to retrograde with impunity. The painter and sculptor, when they condescend to copy, select the most excellent models they can procure; and they only copy that they may with more certainty arrive at a knowledge of

those principles by which those who preceded them attained perfection. I think it is equally important, that we, too, in our selection of examples, should choose those only that are valuable for their beauty of proportion and elegance of form.

There is another class of restoration which is now falling rapidly into disrepute, but which it would not be right to pass unnoticed. I allude to copying portions of old edifices wholesale, and adopting them into new work. I have no doubt that one and all of us, in the days of our "Paul Pryism" (a great fault, I fear, in the profession), have stumbled on some newly erected lofty pile, where you could, without the assistance of your cicerone, tell whence all the individual details had been brought and what positions they had previously occupied. In such a case, although the workmanship was excellent, the different parts in themselves good, and neither money nor labour had been spared in its execution, you felt that it was still tame and unsatisfactory in its general effect; and why? Simply, because it was a piece of unmeaning patchwork, put together without regard to the real expression of the proprietor's wants or feelings, merely because such things had been done formerly. Bannisters that, in the original building from which they had been taken, were synonymous with those that had heralded a Percy, or some such gallant name, to victory on many a hard-fought field, and formed part of the pageant and associations of the "house," calling to the retainers' remembrance deeds of daring done by their fathers, were here useless, because they had no significance or meaning. As a whole, soulless and lifeless, you found in it the spirit of every man's work but his who had put it together; and yet, with a most wonderful degree of vanity, thought himself the veritable architect of the building, and, more than likely, did not allow even a single drawing to leave his office—no, not even that for the nail-heads of the doors—without initialing it in four-inch letters with his renowned name. I do not know how you may have felt on such occasions, but I have always found my arm nerving, and the wish rising with me for the hammer of the iconoclast, that I might strip away some of its borrowed "properties," and show the utter contempt I felt for such heartless perpetrations.

I trust there are few now to whom this stigma will apply in the profession, as I believe that the members generally care more for the honour of their own name than the fee to be received from their client; for, although we can't get on in the world well without that, it will always prove the last consideration in the mind of the true artist.

There is only another class of buildings to which I shall ask your attention—that is, the remains of our ecclesiastical, castellated, and domestic architecture. I allude to those in ruins, some of which could be renewed if it were desirable to do so, and all possessing too much interest and value to be allowed to go further into decay.

If it is desirable to preserve those relics at all, their value will be the greater that we preserve them in as much of their original integrity as is left to us; and although it would be practicable in many cases to complete what is wanting, so that when completed they could again be brought to use, I, for my part, would be the last who would propose such a measure. In a church, for instance, it would not be agreeable to the feelings of a congregation to sit two hours within the grey and hoary walls of such a structure; and if we cover these with plaster, and destroy the unity previously existing between the exterior and interior, the associations connected with it are destroyed, and it will then have lost just so much of its value as a relic.

I have never been so fortunate as to meet with a restoration of that kind which did not raise a greater sensation of pain than of pleasure; and I therefore think it would be better to restrict our endeavours to make good the deficiencies of what is left, than restore what is gone. While speaking of this, I think it would be within the province of the Institute to inform our noble President that there is a great deal of Melrose Abbey in such a state that, if immediate measures are not taken to repair it, the consequences may be very serious; whereas, if taken in time, it will be a simple matter to put it right. Mr. Cousin, Mr. Brown, and I, made a careful examination of the Abbey last season, and were much struck with the condition in which it was. I may here give our Secretary a hint that Mr. Cousin might possibly be persuaded to make this a subject for a paper for our next meeting.

I will only touch upon one other subject connected with restoration, and I am done.

Much discussion has lately taken place in regard to the restoration of the old cross of this city, and placing it on the original site.

If we may form a correct idea of this structure from the description and engraving given by Arnott, I think we may be grateful that we are spared the trouble of its removal, for a greater piece of barbarism can hardly be conceived to have existed. Can any unprejudiced person look on this engraving and honestly say they would desire to see the original restored? If we are to have a cross, there can be no reasonable objection to taking the shaft and placing it on a few steps to raise it sufficiently above the street, as in so doing we would not be violating any principle; but to restore anything more would be a degradation.

It is evident that the civic authorities in 1756, when the substructure could not have been more than one hundred years old, put very little value upon it (although they ought to have made better provision for the shaft). With a greater knowledge of architecture, I think it would be a bold Town Council that would now venture to renew such an edifice.

If, however, the wants of the town really demand a covered cross, with gallery for proclamations, as has been contended, let it be done, and have it entirely new: but don't trammel the architect working up old materials that are unfit for the purpose. At the same time, the shaft of the old might be erected in some convenient place, as has been done with that of Peebles, in the court of the Chambers Institution.

It would be well if we had some court connected with our proposed Industrial Museum, in which, as in that of L'Ecole des Beaux Arts, Paris, such relics could be fitted up and preserved.

I have now, in a hurried and cursory manner, gone over the nature of the buildings requiring restoration, and the manner in which they ought to be dealt with; but in order to have done justice to the subject, it would have required two or three papers and a series of drawings to have illustrated them. The shortness of the time that has elapsed since I was asked to bring it forward has totally prevented me preparing these. If, however, it leads to the matter being properly discussed, I shall be satisfied. I am afraid I may have left much untouched that I should have gone into, and gone into a great deal that I ought to have avoided; but I have not had time to condense and systematise those desultory observations, and trust, as I before mentioned, that my desire and intention will excuse this.

ARCHITECTURAL MUSEUM.

THE lecture for Tuesday last, when Mr. HERSFORD-HOPE, the President of the Institution, occupied the chair, was entitled "On the History of the Temple Area at Jerusalem, with its buildings and sub-structures," by Dr. FERMETZ PIEROTTI, architect to the Pasha of Jerusalem. The lecture, which was numerously attended, was illustrated by a great number of drawings and plans. The CHAIRMAN, in introducing the lecturer, said they would have that night a lecture of very peculiar interest; at the same time he must explain to the meeting why the council had a little deviated from the ordinary routine. The gentleman to whom they would be indebted for the information they should receive that night was Seigneur Pierotti, who had lived in an official situation at Jerusalem for several years, and had collected much topographical and other information in that city. But he could not address a public assembly in the English language, the present being his first visit to England; however, in the French language Seigneur Pierotti would explain very briefly what was the purport of his information, and then after that their friend the Rev. George Williams, who had made the topography of Jerusalem a subject of study, would give more details respecting the discoveries of the lecturer in English. Seigneur PIEROTTI having briefly addressed the meeting in French in introducing the subject of his lecture, the Rev. Mr. WILLIAMS interpreted, and illustrated with much minuteness by referring to maps, drawings, and plans, a document in French containing an account of Seigneur Pierotti's discoveries and inferences concerning the site of the temple of Jerusalem. He premised that there were some points in which he did not agree with Seigneur Pierotti, but that gentleman's discoveries were very interesting. The lecturer then briefly referred to the selection of the site of the temple by David, to give some account from the Scripture narrative of the temple itself, and to state that in the year 70 after Christ the temple was taken and destroyed by the Romans under Titus. He next drew attention to the mosque of Omar and other structures which had been erected on the site of the temple, stated that Seigneur Pierotti had made many discoveries as to the history of the temple area, and gave a description with the aid of the drawings on the wall, first of the exterior of the temple area, and then of the interior. He explained, with minuteness, several drawings relating to Jerusalem, as also a general plan of the city of Jerusalem by Seigneur Pierotti; but what they had more particularly to consider that night was the condition of the area of the temple. In some portions of the area Pierotti found specimens of masonry which he believed to be of the time of Solomon, as they corresponded to the description of the stone given by Josephus. And because he found those stones in the position they were in, he found they were much deeper than the stones used in the other walls in Jerusalem. The stones were of enormous proportions, and clumped together with iron; and Josephus told us that such was the ease with the stones of the temple. Above the Solomonian work Pierotti found that of Herod, then Roman work, and then dabwork, great experience in which he had gained during a residence of eight years in Jerusalem. Seigneur Pierotti found the existence of a conduit, or sewer, which might have conveyed the blood of the sacrifice in the temple down to the valley of the Kedron; he also traced several other conduits, and had found hundreds and thousands of medals and coins in the valley of the Kedron; the coins were very few of them in silver, being mostly brass, but some of them were exceedingly interesting. After describing some other works which Seigneur Pierotti met with in the prosecution of his researches in the area of the temple, Mr. Williams said, in the exterior of the mosque one of the most interesting discoveries was made at the arch of the Ecce Homo, when Pierotti was engaged in the establishment of a house of the Sisters of Zion, a religious body; in making the requisite excavations he came upon a small Roman arch. But that was not the most important discovery he made at that particular part. When making further excavations he found himself in a very extraordinary subterranean building—that was in June, 1860, when he fell into a hole in an enormous underground building. The roof of this extraordinary building was 18 feet below the level of the Via Dolorosa, all filled up with debris. It commenced at the north-west angle of the temple; its length was 230 feet, its width 21 feet, height 26½ feet on the north, and 28 feet on the south part. There was a descent into it by eighteen steps in masonry. What this great subterranean passage was, it was exceedingly difficult to conjecture. Seigneur Pierotti believed it was connected with the fortress Antonia, so minutely described by Josephus, and where Antigonus was murdered. The architecture of this passage was exceedingly curious, and was covered over with enormous flags. Another curious thing in connection with this subterranean passage was, that for a considerable length along the wall there runs a conduit or aqueduct, which formerly delivered itself into the pool of Bethesda. He now came to the most curious discovery Seigneur Pierotti had made; in the course of his excavations he made a discovery which caused great excitement amongst the Jews, Mohammedans and Christians of Jerusalem. He tapped a fountain, and nobody knew whence it came or whither it went. When first tapped the water was very bad, but after giving out thousands of gallons a day, it became more palatable, but still it was water of a very peculiar taste. The water was of so peculiar a character that no two persons agreed as to its qualities: some saying it was sweet, some bitter, some saying it was salt, some insipid, and so on. One traveller described the drinking of the water as like drinking cold milk and water. That water came from the north-east of the city. Seigneur Pierotti thought that here was the aqueduct of Hezekiah, who brought water into the city of Jerusalem. When the Jews heard of the finding of this running water they came flocking down every day to see it, old men, women and children with babes in their arms, to bathe themselves with this water, believing that it indicated the time for the Messiah to come, and for Jerusalem to put on her glory again. The excitement was scarcely abated now, though the source had been running for nearly two years. Mr. Williams next proceeded to refer to Seigneur Pierotti's investigations of the interior of the *Haram es Sherif*. Amongst his discoveries in connection with the fortress Antonia was a subterranean passage between the fortress and the eastern gate of the temple, which corresponded with a passage prepared by Herod for his protection in case of a rising in the city against his authority, of which he was always afraid. That passage Seigneur Pierotti had actually traced. Mr. Williams then referred to Pierotti's excavations at the south-east of the temple, where he found works which he believed to be of the period of Solomon and Herod, and some of which had been rebuilt by Justinian. The vaulting of portions of the work was of Roman times. After referring to other discoveries, including the church of Justinian, and the Dome of the Rock, the columns of which were not *in situ*—not in the place where they were originally set up, Mr. Williams came to the water communication, the conduits and aqueducts within the Temple enclosure.

An enormous quantity of water was introduced into the Temple, to carry off all the blood and offal of the sacrifice, which would have been an injurious nuisance if not taken away. He then pointed out a number of conduits which had been discovered by Seigneur Pierotti, and which evidently had connection with the removal of blood and offal from the Temple. Mr. Williams resumed his seat amidst applause.

Mr. WIGLEY (who is well acquainted with Jerusalem) made some remarks in French, in the course of which he bore testimony to the value of the discoveries made by Pierotti.

Seigneur PIEROTTI made a few observations in reply, also in the French language.

The CHAIRMAN, on behalf of the meeting, thanked most heartily Seigneur Pierotti and Mr. Williams.

Shortly afterwards the meeting broke up.

SOCIETY OF ARTS.

AT the meeting of this society on Wednesday last, Mr. HENRY COLE in the chair, a paper was read "On the Effect of Prizes in Improving Manufactures," by Mr. SAMUEL SYDNEY. The author said that the question to be examined was, whether under any circumstances the improvement of manufactures can be promoted, or manufacturing inventions stimulated, by invitations to compete for substantial or honorary rewards. It was one that ought not to, and need not, be discussed on theoretical grounds, as there was the experience of centuries of trade to refer to, and the records of more than one society. He had no doubt that the general impression amongst the wealthy and educated classes was in favour of the prize system; but his own opinion was the contrary. He thought that the conclusions formed on this subject were founded on the *post hoc, propter hoc* fallacy, and that the real cause of the advance in various manufactures was the daily increasing demand, and competition among manufacturers, and not the prizes given at exhibitions or elsewhere. The most important manufactures of this country had been carried to their present perfection by the ordinary demands of trade competition. No prizes or honorary rewards of an official or unofficial character had ever been bestowed on, or offered to, the authors of the steps by which the iron manufacture, the manifold hardware trades of Birmingham and Sheffield, the woollen, cotton, or linen manufactures, had become famous throughout the world. The manufacture of marine steam-engines, in which such wonders had been effected during the last ten years, and the locomotive engine, had all found sufficient stimulus for daily improvement in commercial enterprise and commercial demand. It might, however, be asserted, that prizes tended to promote solid improvements if they failed in producing great inventions. This view, however, the author combated. He argued that it was extremely difficult to find really competent judges, and that, even if these could be found, how few were the instances in which it was possible to test, in a satisfactory and practical manner, the comparative merits of manufactured articles. A judgment should be founded on evidence. There was very rarely available reliable evidence to guide judges in deciding on the relative merits of manufactures and machinery; therefore such trials and such verdicts had better be avoided. Their tendency was often to unfairly raise, and unfairly to depress, manufactures, while they only mystified the public. The author thought that the admirers of the prize system were in the habit of confounding the advantages of public exhibitions and the public competition of trade with prize competition. He brought forward evidence in support of his views from the awards made at the Great Exhibition of 1851, as well as those of the Royal Agricultural Society for many years past.

Mr. WILSON said he did not think it was a question of prizes in the abstract, but of collecting together the best kinds of productions.

Mr. HAWES then said that Mr. Sydney had taken a very narrow view of the question. The principle of giving prizes in an International Exhibition was quite different to the matter contained in the paper. The Exhibition was for the purpose of making known inventions which could not be obtained by any other means, as the public would be the best judges of inventions.

Mr. PALMER said that the prizes awarded by the society had a very beneficial result. If they gave prizes for merit, why should they not give prizes for manufactures? He thought a certain system of prizes should be continued, but that more judgment should be exercised in their distribution.

Mr. NEWTON WILSON differed from the view of Mr. Sydney. He did not see why manufactures should be excluded from prizes, as the future fame and position of an inventor depended in some cases upon the award of a prize. The effect of prizes in America had been a stimulus in the increased production of manufactures thus noticed. He most strongly advocated the reward of merit, where practical. The Commissioners of the International Exhibition were, perhaps, right when they decided not to fix the position of merit, but to leave the public to judge for themselves.

Mr. SOLOMONS said it was quite clear that if they had not decided upon giving prizes at the approaching Exhibition, they would not have had 4,000 French exhibitors. He was decidedly adverse to the system of prizes being abolished.

Mr. EDMONSON said, with respect to the order of merit, it should be so arranged that prizes should be given to inventors who produced the greatest amount of usefulness at the lowest possible cost.

Mr. BIGLOW (an American gentleman) said he had seen the working of the prize system in New England, and the result was a great improvement in the mechanical arts. He was an exhibitor, and if there had been no prospect of a prize for his invention he certainly should not have gone to the expense of coming over here.

After some further discussion,

Mr. SYDNEY said prizes could do no harm for things which were wanted; but it was a snare and a delusion to give prizes for inventions for novelty alone, and which were hardly of any practical use.

The CHAIRMAN mentioned that Prince Napoleon had lately entered his most emphatic protest against prizes.

SOCIETY OF ARTS.—The Society of Arts, with the view of showing hospitality to the Commissioners, guarantors, jurors, principal exhibitors and others connected with the approaching Exhibition, and especially to our foreign visitors, will hold three evening receptions at the South Kensington Museum, on the 7th of May, 9th of July, and 8th of October.

LIVERPOOL ARCHITECTURAL SOCIETY.

THE fourteenth meeting of the present session of this society was held at the Royal Institution. Mr. Goodall occupied the chair. Mr. Seoufield was elected an associate member. Mr. Heffer called the attention of the meeting to the death of Mr. John Thomas, sculptor, whose death he had seen mentioned in the papers. He was sure that all who were acquainted with the deceased gentleman's work would agree that they were of an admirable character. Mr. Thomas had executed many important and admirable works, both in sculpture and architecture. He (Mr. Heffer) had been a pupil under Mr. Thomas, and felt his loss very deeply; for he was not only a great man as a designer, but he was also a good man, and was highly respected wherever he went. He was also a charitable man, but never acted with ostentation. For the last four or five years he had been largely engaged in works for the late Prince Consort, at Windsor Castle, the Chapel Royal, and at Balmoral, and the skill and taste exhibited in his works were greatly admired. Mr. H. P. Horner said he believed Mr. Thomas was a man who had raised himself by his own talents, and he was sure that anything communicated in reference to his career would be found interesting. The Chairman said he would suggest that Mr. Heffer read a memoir of Mr. Thomas at their next meeting. Mr. Heffer said he would do so.

Mr. FRANK HORNER then read a paper on "Some of the Relations existing between Modern Literature and Art." The paper, described at some length the progress of art and literature in this country, and the influence which they exercised on each other. The Chairman, at the conclusion of Mr. Horner's paper, said that he thought they ought to be on their guard against receiving all the shallow criticism that emanated from the press in regard to architecture, for some of it was not of much value. A conversation took place, in which the Chairman, Mr. Councillor Pieton, Mr. H. P. Horner, and other gentlemen joined, in regard to literature and art.

BODELWYDDAN CHURCH.

IN our present Number we give a view of the exterior of Bodelwyddan Church, near St. Asaph. Views of the interior, and some details, will be found in our last volume, together with a description of the work. As there mentioned, Mr. John Gibson was the architect.

ROAD FROM BAYSWATER TO BROMPTON.

THE new approach to the International Exhibition from the north-west districts is now nearly completed. The entrance to the park is through the Victoria-gate, Bayswater, and the old road is followed, without any material alteration, to the foot of the bridge. The width of the carriage-way over the bridge is increased by about 6 feet, taken from the side path for pedestrians. The carriage-road south of the bridge is followed until it joins Rotten-row, nearly opposite the eastern dome of the Exhibition building. From the point of junction Rotten-row is divided by posts running along its centre to the Queen's Gate. The half next to Kensington-gardens forms the continuation of the road to the Exhibition, and the other half is left for the use of equestrians. Along the whole line there is a side pathway for pedestrians, and the exit is through the Queen's Gate, within a short distance of the western entrance to the Exhibition building.

CHIMNEY-PIECE AT THE INTERNATIONAL EXHIBITION.

AMIDST the, one would think, hopeless confusion, in the shape of empty packing-cases and unpacked articles which in a week are to astonish the world at Brompton, we occasionally catch a glimpse of some work which tells of the energy and spirit with which the collateral branches of the building trade have entered into the contest. Not only is the Medieval Court to show a marked advance upon the collection which Pugin was, eleven years ago, enabled to make, but Hart, Skidmore, and other metal workers, Minton, and numerous tile makers, sculptors of every style, seem determined to win high honour in this international encounter.

We have been asked to direct attention to a chimney-piece, by Mr. G. Mitchell, of Walton-street, Brompton, which appears on another page. It is beautifully carved in every part, and the pure statuary marble in which it is executed admirably displays the carver's skill. It is now standing on the south side of the eastern dome, and its production has, we believe, entailed a sacrifice in time equal to some £200 upon its spirited exhibitor. It is 8 feet 2 inches in width and 4 feet 1 inch high. The shelf is nearly 2 feet in width, and thus allows the sides to be carved in a similar manner to the front.

LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.

A GENERAL meeting of the members of this Society and their friends will be held on Monday, April 28th, at 12 o'clock precisely, Mr. Alderman T. Q. FINNIS in the chair. The members will, by the kind permission of the masters and wardens, meet at Bakers' Hall, 16, Harp-lane, Tower-street, E.C., and from thence proceed to visit the churches of All Hallows, Barking; St. Olave's, Hart-street, and St. Dunstan's-in-the-East. The meeting will, it is expected, be addressed by the following gentlemen:—the Rev. John Maskell, the Rev. A. Povah, Mr. Deputy Lott, Mr. J. G. Waller, and Mr. George Corner. At the conclusion of the meeting dinner will be provided at the Mark-lane Coffee House. The annual general meeting of the Society will be held at No. 7, Mildred's-court, on Thursday, May 8th.

THE DUKE OF NORTHUMBERLAND AND THE THAMES EMBANKMENT.—The Duke of Northumberland, who holds property along the river side, has petitioned the House against the bill for the Thames Embankment, and prays that he may be heard by himself, counsel, agents, and witnesses, before the committee appointed to consider the subject, in respect of any provisions contained in it prejudicial to his rights and interests.

CHURCH, CHAPEL, AND SCHOOL BUILDING.

Cheshire.—A new church has just been begun at Cheadle Hulme. The design (which provides for extension) consists of nave, chancel, and south transept, with vestry and organ chamber on the north side of the chancel. There is a timber belfry at the north-west of the nave. The font stands at the extreme west end; the pulpit on the south side of the chancel arch. There is a credence table on the north side of the sanctuary, and sedilia on the south. The contract has been taken by Messrs. Thackrah and Peirce, of Stockport. The architect, whose design was chosen in competition, is Mr. J. Medland Taylor, of Manchester.

Manchester.—*St. Nicholas Church.*—On Thursday se'nnight this church was re-opened, after having been closed for about twelve months for restorations. There are now three stained windows. That over the altar is a memorial window of the Rev. John Fuller, who died in 1844. The window directly opposite to this has been presented by J. Foord, Esq., and that to the north by P. W. Martin, Esq., M.P., and bears the Wyckham and Martin arms, and also those of the city. The most important of the improvements that have been effected has been the increased accommodation afforded by the old pews being replaced by open benches, and a gallery erected around the whole body of the church, there being formerly only an organ gallery at the west end. Mr. Gough is the architect. The works have been executed by Mr. Stump, at a cost of £1,700.

Yorkshire.—*New Church at Carlton.*—On Wednesday se'nnight, the foundation-stone of a new church was laid at Carlton. The old fabric had fallen to decay, and the new structure will be built upon its site, at the sole cost of Lady Beaumont. Messrs. J. B. and W. Atkinson, of York, are the architects. The edifice is to be of the geometric decorated style. The nave will be 73 feet in length by 25 feet 8 inches in breadth, the chancel 24 feet by 18 feet, and there will be a north transept 16 feet by 15 feet. At the south-west angle of the nave will be a tower 55 feet in height, surmounted by a spire 49 feet high. The porch will be on the south side of the church, and the vestry on the opposite side near to the transept. The east window will be of four lights, and the west window will contain five lights. The roof will be open timbered, stained, and varnished, and covered with blue and green slates. The walls of the church will be faced with Bradford sets. Ancaster stone will be employed for the dressings. The lower part of the tower will be used as a baptistry, which will be entered under arches opening into the church and porch. The entire cost of the building will be about £3,000.

Ireland.—*Carmelite Church, Moate.*—This building is now being "re-modelled." The sanctuary has been rebuilt and furnished with a mediæval altar, tabernacle, and altar furniture. The altar, supplied by Messrs. Barff, of Dublin, is composed of Caen stone, with illuminated glass work in front. A small Lady chapel has been erected at the gospel side of the sanctuary, with a stained glass window. The aisle at the southern end of the church is finished externally in chiselled limestone, and lighted by five double lancet windows. The tower has now reached the height of forty feet. A stone spiral staircase runs up the tower. The nave will be divided from the aisles by five arches springing from polished pillars, above which will be five two-light lancet windows at each side. The first of these arches have been already erected, and the required space has been obtained by removing a portion of the old external wall of the southern side. The same course will be pursued in the construction of the other arches. The foundation of the northern aisles is being built, and the work is progressing rapidly. The old convent has been removed, and the site of the church cleared. When the works are sufficiently advanced the old roof will be taken down, and the walls of the nave carried to their required elevation. The sanctuary will be lighted by three two-light windows, and the ceiling is to be groined in plaster. The style adopted is Early English. The tower will be surmounted by a spire 126 feet from the ground. All the stone required for the erection of the new church had to be brought from Tullamore, a distance of thirteen miles, as even rubble stone is not to be found in the neighbourhood of Moate.

Bradford and Beswick.—*Christ Church.*—This church was consecrated on Saturday. The building is the first of a series that has been undertaken under the auspices of the Diocesan Church Building Society. The building is of brick, in the Gothic style, and is free from ornament, within and without. It consists of a nave 45 ft. wide, transepts 79 ft. from north to south, a chancel terminated by an elliptical apse, and a tower, which is intended at some future day to support a spire. The extreme length is 114 ft. The building cost £4,500, and will accommodate about 1,000 individuals. The organ chamber is on the north of the chancel, the vestry on the south. The roof is open timbered, and lofty. The pulpit is of Caen stone, with polished red marble columns and carved capitals. The reading desk is of oak. Many of the internal fittings and furniture have been presented by those who have taken an interest in the erection. The designs were prepared by Messrs. Hayley and Son, and the contract was taken by Mr. Joseph Grason, of Bradford. It is proposed to build a parsonage immediately, for which Mr. J. M. Taylor is the architect.

Berkeley.—*Proposed Restoration of the Church.*—Lord Fitzhardinge, it is stated, has given instructions, in the carrying out of this undertaking, to have the work restored, as far as possible, to its old state, merely washing off the whitewash and colouring, and carefully cleaning the Early English capitals of the arcades, and painting and gilding them after the ancient manner, one of them having been found with sufficient of the ancient colouring to give the clue to its restoration. These arches and capitals are among the most beautiful examples in the country. The pavement will be taken up and relaid to its ancient level, and the incised slabs refixed in their present positions. A new carved stone pulpit, with figures and marble shafts, will be placed outside the screen, and there will be a new carved oak reading desk. The organ and gallery will be removed, and the western windows opened and repaired, the organ being refixed at the north aisle. The whole of the church will be re-pewed with low oak sittings. The stonework is to be repaired, the windows re-glazed, the roughest beaten off the walls, pointed, and repaired. The chancel is not to be done at present. The roofs are to be thoroughly repaired and restored. The work of restoration is to be under the superintendence of Messrs. Popes and Bindon, of Bristol. The estimated cost is about £2,000.

Welton Church.—The parish church of Welton is about to be restored and enlarged, and the whole of the cost, about £6,000, will be defrayed through the liberality of Miss Bradley, of Welton. The church was erected, it is supposed, about the time of William Rufus, dedicated to St. Helena, the mother of Constantine the Great, and has been restored several times, the last being about the year 1828.

North Bradley Church.—This parish church, situated about three miles from Trowbridge, having fallen into a state of decay, it was recently decided to have the whole edifice thoroughly restored. The expenses were estimated by the architect, Mr. T. W. Wyatt, at £1,600. In pulling down the edifice, the builders, J. Davis and Son, of Frome, found the old foundations of the church were built upon arches, under which were vaults. When the workmen arrived at this, the whole crumbled in. It at once became a question whether these insecure foundations should be repaired, or new ones placed there. As this unforeseen difficulty was not anticipated in the contract, it was determined to lay new foundations. A few days since the foundation-stone was laid. The nave is of the Early Transition period, and the chapels and tower of the Perpendicular. The church is supposed to have been founded in 1100, and was the gift of King Henry to the College of Winchester.

King's Cliffe, Northamptonshire.—Mr. Browning, architect, of Stamford, is about to invite tenders for the restoration of Cliffe Church, the tower of which is Early Norman.

Beneden.—This church, dedicated to St. George, has been restored, and was reopened on Sunday last. It consists of chancel, chancel chapels, and nave, and side aisles. The date of the building of the church appears to have been about the end of the fourteenth or beginning of the fifteenth century. In 1672 the church was struck by lightning and destroyed. It was rebuilt in a debased style. The arcade separating the nave from the aisles consisting of Ionic columns and Italian moulded arches; while over the nave was a semicircular plastered ceiling upon wooden ribs, with tie beams across. The tower at the west end has in it a western window, and one of the principal entrances; and these have been restored and thrown open to the interior—a belfry chamber filling the space beneath the tower, with an open arch into the nave, which has five bays; the pillars are octagonal, with plain capitals. The open roof is supported by oaken timbers, which rest upon carved corbels, representing English foliage and fruits. The chancel aisles have two bays, the pillars of which are clustered, and have carved capitals. In the chancel are benches for the choir, and on the north side is the organ. The roof is panelled, with moulded ribs. The chancel proper is paved with Minton's tiles, and has a reredos with gilt and chromatic emblazonings. The lower part of the east window is divided into eight compartments, representing the later scenes in the life of the Saviour. The upper part of the tracery is filled in with angels; the sign of the Holy Ghost being at the extreme elevation. The pulpit is of Bath stone, supported upon columns, and the panels on each side have diapered work in recessed arches. It is placed on the north side of the chancel arch, which has at the springing on each side two sculptured angels. The font is of Caen stone, appropriately decorated. All the seats are open, and will accommodate 480 adults and 80 children. The whole of the windows which have not been replaced by new ones have undergone a thorough restoration; and the stonework of the walls generally has been repaired.

The New Church for Jarrow Docks.—The committee for building this new church have just issued a report. The work undertaken by them is in an advanced and satisfactory state. The sum of £1,742 4s. 2d. has been expended on the works up to the present date. The builder is bound to complete the undertaking by the 8th day of June next, and it is expected that the consecration will take place in July.

Leamington.—*New Roman Catholic Church.*—The works of this structure have been commenced. The edifice will be 121 feet long, 56 feet wide across the aisles, and 80 feet across the transepts. The nave will be 32 feet wide, separated from the aisles by arcades of five arches, and will be crowned by a clerestory, which together make a height of nearly 50 feet. The roof is waggon-shaped, which will give the interior a total height of 60 feet. There are stone altars in a row at the east end; and ultimately it is intended to erect a tower, detached from the church, 24 feet square, and 150 feet high. At the end of the church sufficient ground is reserved for a quadrangle 60 feet square, surrounded by presbytery, schools, and cloisters. The building is designed in the style of the first half of the thirteenth century, constructed of red brick, relieved by bands of Warwick stone, with dressings of Bath stone. The interior is lined with red brick, with stone bands, and the arcades and dressings are also executed in Bath stone. The exterior, the roof of which is covered with tiles, will be very simple. It will possess scarcely any ornament beyond what the construction of the building necessitates. For the interior have been reserved all the resources that the money to be expended places at the disposal of the architect. The outlay upon this portion of the work will be about £5,000. The architect is Mr. Henry Clutton; the contractor is W. Gascoyne, Leamington.

York.—Some time ago, plans were deposited for the erection of a new Roman Catholic Church and Presbytery, upon the site now occupied by the Roman Catholic Church of St. Wilfred, York. Tenders for the erection of the edifice will be advertised for in the course of a few weeks. We hear that arrangements are being made for the pulling down of the present chapel, presbytery, and adjoining house in the course of the next month. The church is to be Gothic. In the south-west front is to be an elaborately carved door-way, with windows above, surmounted by an oriel window. Over the south-west corner of the church will rise a tower to the height of 140 feet. The internal arrangements of the church will consist of a nave and two aisles, with a large apsidal sanctuary, having a lady-chapel on the north-west side and a large vestry on the north-east. There will be an organ gallery over the west front, and the aisles will be lighted by clerestory windows. Mr. Goldie is the architect.

Derry Cathedral.—The works in the interior of Derry Cathedral, which have been so long in hand, are at last rapidly approaching completion. The entrance to the church is by a vestibule, having traceried panels, and doors filled with plate glass. The floors of the porch, vestibule, aisle, and chancel are laid with Minton's encaustic tiles. The stalls for the dean and prebendaries are placed at the west end, and the bishop's throne is near the east, almost opposite the pulpit. It is octagonal in form, surmounted by a ribbed canopy, terminating in a crocketed spire of open work. The old pews are replaced by open benches, the backs of which are filled in with perpendicular tracery. The bench ends are finished with carved poppy-heads. The western gallery affords sittings for about 120 persons, exclusive of the accommodation required by the organist and choir. The whole of the fittings and interior woodwork are of Riga oak.

CHAPELS.

Dorchester.—*The Dorset County Hospital Chapel.*—The little chapel which has recently been added to the Dorset County Hospital was opened on Wednesday se'nnight. The new chapel is situated on the north-east corner of

the pile of hospital, and forms a continuation of the Bankes' wing. It is in the early English style of architecture, built of Ridgway random coursing, with Portland stone dressing, surmounted with a bell turret and spire. At the east end there is a large three-light window, with tracery; lancet windows are inserted on each side. The roof is formed of semicircular ribs, with diagonal boarding. A gallery at the west end has been constructed over the lobby entrance from the men's ward to afford extra accommodation, and this communicates direct to the women's ward on the upper story. The fittings are of red deal and pine, stained and varnished, the open benches affording seats for about eighty. Under the chapel there is a lobby open to the yard by two large arches, for the patients to resort in bad weather. Mr. B. Ferrey is the architect; the work has been executed by Mr. Wellspring, Dorchester.

Keal.—New Wesleyan Chapel.—The first stone of a new Wesleyan chapel about to be erected at Keal was laid a few days since.

Clifton Wesleyan Chapel.—We understand that, on Tuesday, the foundation stone of a new Wesleyan Chapel was laid on a site in the Queen's-road, Clifton. The building is in the Gothic style of the 14th century. The plan of the chapel is a parallelogram 85 feet long by 40 feet wide, including front lobby, and there will be a gallery at the western end. A lobby under the gallery extends the entire width of the chapel, and is entered from the outside by a deeply-recessed doorway under a canopied gablet in front, and through a porch on the south side. A turret on the north side contains the entrance and staircase to gallery. The chapel is lighted by three large traceried windows in the west end, and by two-light windows on each side. There will also be a circular window in the gable of the east end. The roof will be open, the trusses being arched, and bearing on freestone shafts, with carved capitals and bases, which will rest on carved corbels. The ground on which the chapel is being erected having been partly quarried, and filled in with earth, it was necessary to excavate to a considerable depth before a proper foundation could be obtained, and it was, consequently, determined to form a large room below the chapel floor. This room will be the entire area of the chapel, and 15 ft. high and will be lighted by windows on each side. There will be a vestry 31 ft. by 17 ft. on the same floor as the lower room, and two smaller vestries on the chapel floor. The chapel will accommodate about 700 persons. The building will be faced with freestone, with courses of red or gray stone. The architects are Messrs. Fosters and Wood, of Bristol.

West Ashling, Sussex.—A chapel is about to be erected at West Ashling, Sussex, from designs by Mr. Horatio N. Goulty, architect, Brighton. An interesting circumstance in connection with its erection is that the walls are to be built of the stone that once formed the tower and spire of Chichester Cathedral. It is to be built in the early English style, and will accommodate 300 on the ground floor—provision being made for the erection of a gallery at a future time.

SCHOOLS.

Abbey-lane, Saffron Walden.—Additions are being made to the school-room just completed at Abbey-lane, Saffron Walden, Essex, by the erection of an infant class-room and two separate rooms for senior scholars. The work is being carried on by Mr. Wright, the contractor for the original building, under the direction, and from the designs of, Mr. Horatio N. Goulty, architect, Brighton.

Windsor Royal Free and Industrial Schools.—The new building recently erected for these combined institutions was formally inaugurated on Monday. The Windsor Free School was originally established in 1705, the number of scholars at first contemplated being 40 boys and 30 girls. During the next century the institution carried on a useful work, and its funds were gradually augmented by successive donors, till they nearly reached £6,000. The population of Windsor having, concurrently with these changes, greatly increased, in 1819 the trustees applied to the Court of Chancery to be allowed to extend the charity so as to include 100 boys and 100 girls. Failing in this application, they, however, then established a National School, and it has long been felt desirable that the two kindred institutions should be amalgamated. The limited and inconvenient nature of the old buildings has hitherto been a bar to the full carrying out of that project; but their union has at length been consummated, under the sanction of the Charity Commissioners, by the location of the two schools upon the same site, and, in fact, under the same roof, their joint title being "The Windsor Royal Free and Industrial Schools." The building, which is calculated to accommodate 500 scholars of both sexes, is a plain red brick structure. The original plan embraced greater architectural pretensions, but the Government, as a condition to the bestowal of its grant in aid of the building fund, insisted on the rigid exclusion of all ornamentation from an edifice designed for a strictly charitable purpose. The boys' school is on the ground floor, and the girls' school above, and both are admirably adapted for their end. The boys will be taught gardening and other industrial employments; while the girls are to be fitted for domestic service by being trained in cooking, washing, nursing, &c. The total cost of the site, buildings, and fittings is £4,898.

Ashton-under-Lyne.—New Independent Schools.—These new schools, the foundation-stone of which was laid twelve months since, have just been opened. The main feature of the new building, internally, is the large school-room, the dimensions of which are 100 feet by 50 feet (exclusive of recesses on each side), and 25 feet high to the tie beams. Including the recesses, the extreme internal dimensions are 116 feet by 70 feet, and the centre portion of the ceiling (which rises into the roof) is 35 feet high. Each end recess is occupied by a platform 4 feet high; that at the east end for speakers or lecturers, and the opposite platform for an organ. The north-side recess is separated from the room by a partition, and is divided into two compartments for the use respectively of secretary and librarian. Each side recess has two sets of coupled iron columns with white and gold foliated capitals; and from these columns spring a central and two smaller arches, with paneled soffits. Ingress and egress to and from the great room are by five doorways, four of which communicate with two stone staircases, and the other with a lesser stone staircase, intended for access to the speakers' platform and reserved seats. In connection with the speakers' platform is an ante-room, also entered from the platform staircase. This room is fitted up for a young men's class, and measures 36 feet by 24 feet. Underneath, and on the ground floor, is a class-room of the same dimensions, which contains a gallery for 200 infants, and is very lofty. On the ground floor of the building are ten class-rooms, of varied sizes, the largest being 20 feet by 14 feet, and the smallest 14 feet by 13 feet. These rooms are in two sets, one for young men and the other for young women, corresponding; each set is approached by separate entrances and corridors. In the centre of the ground floor, and dividing the sets of class-rooms, is a lecture-room, arranged in the form of an amphitheatre, with rising seats, capable of seating 500 persons. This room is entered by folding-doors from

each corridor, and private entrances are provided to the lecturers' platform. The style is Italian, of white and red bricks. The cost of the whole undertaking will be about £10,000. The works have been executed from the designs, and under the superintendence of Messrs. Paull and Ayliffe, architects; and the general contractors are J. and J. Longson, of Stockport.

Reviews.

An Account, with Illustrative Sketches, of Cranston's Patented Buildings as applied to Horticulture. 4to.; Temple-row West, Birmingham.

THIS "account" shows, in a series of lithographed sketches, with descriptive matter, a mode proposed by the author for the construction of horticultural buildings on a patented principle, applicable to both large and small erections. Of the former, one erected at King's Acre, Hereford, is illustrated, and would appear to combine practical utility with some artistic effect. The smallest structure shown is a lean-to, 7 feet wide, erected against a garden wall. The principle of its construction is thus described:—

There are four compartments of rafters filled with glass, each $3\frac{1}{2}$ feet long, three compartments towards the front, and one over the wall facing the contrary way, and these divisions are separated by what has been called, to distinguish them clearly, "radial ribs," fixed edgewise, and running lengthways of the building under the lower ends of the bottom rafters, and between the top and bottom ends of all the others; each radial rib, in all cases, irrespective of the shape or size of the building in which it is, or any other consideration whatever, being perforated for ventilation, by small openings close to each other, from end to end, and having a valvular apparatus on the inside of it, for properly regulating the ingress and egress of air. To the bottom edge of each radial rib the upper ends of the rafters are secured, and upon the top side of it the feet of the rafters rest. The external aspect of a roof so framed presents to the eye a series of planes fitted with glass, divided vertically by small wood rafters, and horizontally by the radial ribs, also of wood, so fixed to make the top of one plane recede a few inches, that the lower end of the plane immediately above it might project and overhang. The radial ribs are themselves fixed to other timbers, put together in the shape necessary to receive them, and which act as "principals," spanning the house internally at intervals of about eight feet.

In other words, the sides or roof of the house is tilted about every three or four feet, the tilting-piece being perforated for ventilation. The construction is simple—

So that when it is necessary to pull down and re-erect the house this can be done by any workman without waste of wood or glass, each rafter, as well as every radial rib or other part, being screwed together again as firmly as ever. Any gentleman fond of labour may, with the assistance of his servant, either pull down and re-erect one of these houses, or put it up in the first instance; for the pieces of which it is formed will fall into their right positions, to be fixed there by screws, as readily as an iron bedstead is fitted together. In new houses all the timbers will be numbered and marked, the screw-holes bored, and everything done before they are packed up and sent off, to make the work of erection as easy as need be.

On Iron Breakwaters and Piers. By E. B. WEBB, Civil Engineer. 4to.; Lockwood and Co.

THE writer of this work believes that he has designed a breakwater free from the disadvantages which attend the employment of either solid or floating structures. In its simplest form it is described as being "supported on cast-iron cylindrical piles, sunk into the ground either by screws or by the process adopted in the construction of the Morecambe Bay Viaducts." The piles are filled internally, to above high-water mark, with concrete; to these are fixed girders, or beams of iron, placed, as a convenient distance, at 10 feet apart. The girders have sockets, in which are fixed the ends of pipes forming that portion of the surface of the breakwater which rises above low-water mark. The pipes resemble gas or water mains, but are of cheaper construction. The ends of these pipes are securely fixed in the sockets of the girders by crescent wooden wedges, which, while keeping up the ends of the pipes, relieve the girders from the effect which the blows of the waves acting upon iron against iron might otherwise produce. The space between the pipes admit a certain portion of the waves to pass through, diminishing the force of the blow of the waves and preventing any disturbance of the surface water inside the harbour. A set of similar pipes is fixed vertically between the piles in the front row to a depth varying, according to circumstances, from 6 to 12 or more feet below low water.

The author claims, for the proposed breakwater, durability, strength, power to create smooth water harbours, facility of construction, alteration and repair, and economy of cost.

CHATHAM BARRACKS.—The Admiralty have decided on the immediate enlargement of the barracks, in accordance with the plans laid before Parliament some three or four years back, when the sum of £60,000 was taken in the Estimates for the proposed work. Of this amount a considerable sum has already been expended in the purchase of the land on which the additional barrack buildings will be erected, the proposed enlargement necessitating the removal of one large hotel, one tavern, and about twenty private houses. The whole of these have been taken down, and the site cleared as far as the boundary wall of St. Mary's parish church, to which the new barracks will extend. The plans for the proposed enlargement have been approved by the Admiralty, and the works will be immediately commenced. The block of buildings forming the right wing of the present barracks, inhabited principally by the single officers of the division, will be taken down and removed as far as the boundary wall of the church, which will increase the barrack parade-ground to about twice its present size. The field-officers' quarters, as well as the barracks and other offices, will be removed to another locality. It is also contemplated to take in a portion of Chatham Dockyard, and to throw the barracks back; the public road leading to the New-stairs will not be blocked up, but communication with that portion of the buildings will be maintained either by means of an arch thrown over the road, or by an underground passage. The new barrack-buildings will provide accommodation for 700 additional marines.

GIBSON'S TINTED VENUS.—This celebrated statue is about to be lent by its owner to the Commissioners of the International Exhibition. It is by many supposed that Mr. Gibson has tinted his statues to represent life, whereas he has only endeavoured by colour to soften the general effect, and to give the appearance of ivory, a material much used by the ancients. This statue was executed ten years ago for Mr. Robert Berthou-Preston, and by his permission remained in Gibson's studio at Rome until 1859, since which time it has been in its owner's possession, although never exhibited until the present occasion.

Correspondence.

BIRMINGHAM AND MIDLAND INSTITUTE.

SIR,—Some of your readers have probably seen with surprise a recent advertisement inviting architects to send in designs to finish the Birmingham and Midland Institute, of which I am the architect.

In the year 1855 a limited competition was entered into for this building by nine architects (one of whom is since dead), the condition being that the selected architect should receive no premium, but should be entrusted with the professional superintendence of the work. My designs were chosen, but, owing to financial difficulties, only one half of the building could be then erected, and this was completed some years since from my drawings and under my superintendence.

The Town Council of Birmingham, being now desirous of erecting a free library, propose to build it in connection with the Institute, and thus complete the latter building.

At their request I have furnished them with a complete set of upwards of fifty working and other drawings, specifications, &c., but on advertising for tenders it has proved impossible to erect the building for the amount of my first rough estimate, which was based upon the cost of the first half of the works. On this fact being ascertained, I at once offered to forego all claim for remuneration for what I had done, and to prepare new plans to suit the financial exigencies of the case.

The first part of my offer was at once accepted, and the only answer to the latter has been an invitation to other architects to furnish plans to complete the building, according to my elevation, which invitation is accompanied by a block plan, copied from one of mine, which the Council happen to possess.

I cannot suppose that such an invitation will be responded to by any one who either respects himself or the profession to which he belongs; but, feeling that on public grounds the matter ought not to rest where it is, I have placed it in the hands of my solicitor, and am advised that the proposed competition cannot be legally carried out, and that those who may take part in it will consequently lose their time and labour.

You will see by the enclosed statement the opinion of most of the competitors in the original competition in 1855, and I have been assured by those of the latter whose names are not appended to the statement that they fully concur in its views.

EDWARD M. BARRY.

I, Old Palace-yard, 23rd April, 1862.

ENCLOSURE.

March, 1862.

Having furnished designs in the original competition for the Birmingham and Midland Institute, I am of opinion that it would not only be unjust to Mr. Barry to entrust the completion of his design to other hands, but that such a course would be a direct breach of the engagement entered into by the Institute at the time of the competition, to entrust the architect of the selected design with the professional superintendence of the building.

TENDERS.

BATH STONE OF BEST QUALITY.—Randell and Saunders, quarrymen and stone merchants, Bath. List of prices at the quarries and depôts, also cost for transit to any part of the United Kingdom, furnished on application to Bath Stone Office, Corsham, Wilts.

BATH STONE OF BEST QUALITY.—Box-hill ground stone; Farleigh Down, ditto; Combe Down, ditto.—Stone and Sons beg to inform architects, builders, and others, that they are in a position to supply the above-named article in block or ashlar, of the very best quality, direct from their own works. Delivered to any part, either by rail or water carriage, on the most reasonable terms. Prices furnished on application at the Bath Stone Office, Widocombe, Bath.

PIER, BLACKPOOL.

The tender (£11,540) of Messrs. Laidlaw and Son, of Glasgow, has been accepted for the construction of the Blackpool Promenade Pier. Messrs. J. B. and E. Birch, engineers. Quantities supplied by Messrs. R. L. Curtis and Son.

SCHOOLS, EXETER.

For building new Wesleyan schools, in King-street, Exeter. Mr. W. Blackmore, architect.

Bradford	£1,120	Gardner	£980
Moass and Sons	1,065	Moore	932
Mitchell	1,056	Woodman	870
Tozer	1,029	Grant and Son (accepted)	715
Ware and Son	996		

FARM BUILDINGS, WIGSTON.

For erecting farm buildings, at Wigston, for A. Cooper, Esq. Mr. William Millican, architect, Leicester.

	Amount of Tender.	Allow for old Materials.	Add for Carriage.
Hutchinson	£650 0 0	£15 0 0	£40 0 0
Sharpe	645 0 0	14 5 0	40 0 0

COMPETITIONS OPEN.

CLOCK TOWER.

HASTINGS.—The Prince Consort Memorial Committee appointed to carry out the above object at Hastings invite architects and others to submit designs for the same. The sum of £10 10s. will be paid for the design approved of by the Committee, which design will then become the property of the Committee. Particulars from Robert Growse, town clerk, High-street, Hastings, to whom designs must be delivered before the 1st May.

CEMETERY WORKS.

CHELTENHAM.—The Burial Board for the borough of Cheltenham require plans, estimates, and general specifications, for the laying out, constructing roads and footpaths, erecting buildings on, fencing in and planting, certain lands purchased by them for a cemetery, the superficial area of which is eighteen acres. The designs must include a ground-plan, showing the sites of the different buildings required, the courses of the carriage-roads and walks, the courses, also, of the drains, the division of the land into the several sectional burial-places, and the subdivision of such places into plots for burial. The plan, also, should show the manner proposed for the ornamental planting of the land. Should the intentions of the designers as to the laying out of the land render it necessary, sections of the earthwork required, and formation of the ground surface as proposed to be made, should be provided, and such other details and suggestions as the competitors may think necessary to illustrate and make clear their designs. Plans, elevations, and sections must be provided for two chapels, dead-house, lodge, gates, and walls at entrances, &c. Specifications must accompany the plans, describing the manner of construction, the class and substance of material in the several buildings, and estimates of their several costs. Plans, specifications, and estimates of the manner of laying out and planting the site, of forming and making the roads and footpaths, and of the character and cost of fencing the site, to be also provided. Plans, &c., may be either for forming and finishing the roads and footpaths, laying out and planting the site, or for fencing the site, or for the chapels and other buildings before mentioned, and the entrance-walls and gates, or the whole of the works, may be combined in the plans, &c., of any competitor; but the Board reserve the right of selection at their discretion from the plans, &c., submitted to them. A premium of forty guineas will be given for the best designs, specifications, and estimates for the whole of the works sent in; and a premium of twenty guineas for the second-best designs, specifications, and estimates for the whole of the works. Should designs, &c., be selected for part of the works only, a fair arrangement as to the premium will be made by the Board, with the successful competitors. The plans, &c., selected to become the property of the Board. The plans, &c., are to be distinguished by a mark or motto, and accompanying them a sealed envelope, having the same mark or motto outside, and within the name and address of the designer, and the terms on which he will superintend and supply his professional services in execution of the works. Plans and particulars of the land may be had of Mr. Henry Dangerfield, borough surveyor. The plans and other documents to be sent to G. E. Williams, clerk to the Board, Public Offices, Cheltenham, on or before the 29th May.

SCHOOLS, &c.

DURHAM.—Plans and elevations are wanted for [schools and teachers' residences, in conformity with the rules of the Committee of Council on Education, at Stockton-on-Tees, Durham. The boy's school to accommodate 250; the girls' school, 200; and the infants' school, 200. Three teachers' residences. Ten pounds will be given for the most approved set of plans. Further information and tracing of site may be obtained of William Skinner, Esq., Stockton-on-Tees, to whom plans, with estimates of costs, must be sent, not later than the 30th April.

LIBRARY AND READING ROOMS.

BIRMINGHAM.—The Free Libraries' Committee of the Council of the Borough require plans, sections, specifications, and estimates for the erection of a free reference library and reading-rooms, lending-library and news-room, and gallery of art, upon the place of vacant land adjoining the Midland Institute Building, with an elevation uniform with the said building. Intending competitors are requested to send in their plans, specifications, and estimates, under cover to Thomas Staudbridge, town clerk, Town clerk's office, Temple-street, endorsed "Plans for Free Reference Library Buildings," on or before the 16th June. Particulars of the accommodation required, and of the conditions of competition, together with a lithographed plan of the site, may be obtained on application.

CHAPEL.

LEICESTER.—A premium of ten guineas is offered for the best design for a Wesleyan chapel, to be built in Leicester, capable of holding 900 persons. Architects wishing to compete may, upon application to Mr. H. Wale, 56, New-walk, Leicester, receive a plan of the site, and instructions and any other information required. The plans to be forwarded, carriage free, addressed to Mr. H. Wale, on or before the 1st May, accompanied with a sealed envelope, containing the architect's name, and bearing a motto corresponding with one to be placed on his design.

MEMORIAL.

GLOUCESTER.—The committee appointed to carry out the Hooper Memorial, at Gloucester, invite sculptors to submit models of designs for the figure of Bishop Hooper, which is intended to be placed under the canopy of the monument just erected in the churchyard of St. Mary de Lode, Gloucester. The models or statuettes to be carved in stone, and to be one-quarter the real height (7 feet). The author of the best design, approved by the committee, will be appointed to execute the full-sized figure; and the sum of ten guineas will be awarded for the second-best design.

DRAINAGE.

KINGSTON.—The Corporation of the borough of Kingston-upon-Thames invite engineers and others to submit plans, specifications, and estimates for a thorough and complete system of drainage of the borough, and offer a premium of £100 for the plan approved, retaining the liberty to carry it out or not. The plan approved to become the property of the corporation. The system to be as far as practicable with existing drains, the plans and descriptions of which are at the Town Clerk's office. The plans, &c., stating also the commission for carrying out the works, to be sent to the Town Clerk's office on or before the 17th day of May next.

COMPETITION AWARDED.

SCHOOLS.—In a limited competition for "The Warehousemen and Clerk's Schools," the Committee have awarded the premium of fifty guineas to Mr. James L. Pedley, architect, 36, Southampton-buildings, Chancery-lane.

CONTRACTS OPEN.

PUBLIC BUILDINGS.

EDINBURGH.—For the erection of a large building in Edinburgh. Plans, &c., with Mr. Henderson, architect, 7, Hill-street, Edinburgh. Tenders to 15th of May.

LIMEHOUSE.—For the erection of new offices and board-room, in White Horse-street, Commercial-road East, for the District Board of Works. Drawings, &c., upon application to Mr. Charles Danch, architect, White Horse-street, Commercial-road East. Tenders are to be delivered at the offices of the Board not later than 12 o'clock on the 5th day of May.

DARLINGTON.—For the erection of Darlington new market, town offices, and clock tower. Plans, &c., with George Dickinson, C.E., Surveyor to the Board, Central-buildings, Darlington, or at the office of Mr. Alfred Waterhouse, architect, Mount-street, Manchester. Tenders to Mr. Dickinson, endorsed "Tender for Darlington Market, &c.," and addressed to the Chairman of the Darlington Local Board of Health, on or before 5th May.

BANK.

LINCOLNSHIRE.—For the erection of a bank and manager's house at Spalding, for the Stamford, Spalding, and Boston Banking Company. Particulars from Mr. William Eve, surveyor, 3, Union-court, Old Broad-street, E.C. Tenders on or before the 17th May.

MARKET BUILDINGS.

BATH.—For the erection of iron roofs, masonry, and other works involved in the reconstruction of the Bath provision markets. Plans, &c., on application to Hicks and Isaac, architects, 13, Northgate-street, Bath, from May 3. Sealed tenders to the Town Clerk, Guildhall, Bath, for the separate trades, endorsed, "Tenders for the reconstruction of Markets," by the 15th of May.

INFIRMARY.

DEAL.—For erecting the Deal and Walmer Dispensary and Infirmary. Plans, &c., at the Mariners' Reading-rooms, Beach-street, Deal, to the 28th April. Tenders, under cover, to the "Committee of the Deal and Walmer Dispensary and Infirmary, Beach-street, Deal," endorsed "Tender for Building," on or before 1st May.

MAIDSTONE.—For the erection of a new wing to the West Kent Infirmary, Maidstone; the addition of an upper story to the present central building, and other works. Plans, &c., with Henry Blandford, architect, Maidstone. Tenders, sealed and endorsed "Tender for Works, West Kent Infirmary," to the secretary at the Infirmary, on May 3rd, by 2 p.m.

WORKHOUSES.

YORKSHIRE.—For the building of a new workhouse at Pateley Bridge, Yorkshire. Drawings, &c., at the offices of the architect, 93, Micklegate, York, from the 28th inst. to the 2nd May, and at the Board-room, Pateley Bridge, from the 3rd to the 9th of May, both inclusive. Tenders to the Clerk of the Guardians, Pateley Bridge, on or before the 9th May. Schedules of quantities can be obtained of the clerk, at the Board-room, Pateley Bridge; and of Mr. B. Wormald, surveyor, 23, Skeldergate, York, on and after the 2nd May.

YORKSHIRE.—For the erection of a new union workhouse, at Wetherby, in the county of York. Drawings, &c., with James Coates, jun. clerk to the Board of Guardians of the Wetherby Union, until the 28th inst. Tenders sealed, endorsed "Tender," and addressed to Mr. Coates, will be received on or before the 28th inst.

CHURCHES.

NORFOLK.—For erecting a new Methodist Free church, Holt, Norfolk. Plans, &c., at the office of Mr. Jeckyll, the architect, Queen-street, Norwich. Combined or separate tenders for different parts of the works to be sealed and delivered to Mr. W. Leggett, Holt, on or before 10 o'clock of the 30th of April, endorsed, "Tender for Methodist Free Church."

BERKS.—For restoring and part rebuilding the parish church of Wokingham, Berks (where there is a junction station of branches of the South Eastern and South-Western Railways). Plans, &c., at the office of Mr. W. Wheeler, solicitor, Wokingham, till the 13th. Sealed tenders directed to Mr. Wheeler, on or before the 29th inst.

DWELLING HOUSE.

GLOUCESTERSHIRE.—For the erection and completion of a villa residence, with stable and coach-house, proposed to be built near Stroud, Gloucestershire. Drawings, &c., at the offices of Messrs. Franklin and Clissold, architects, Stroud. Tenders to be delivered to Messrs. Franklin and Clissold, on or before the 28th inst.

POLICE STATIONS.

SIDMOUTH.—For the erection of a police station, &c., at Sidmouth, Devonshire. Plans, &c., with Henry Ford, Clerk of the Peace, Castle of Exeter, and at the office of Messrs. Radford and Williams, Clerks to the Justices, Sidmouth. Sealed tenders, endorsed "Tender for Sidmouth Police Station," to be sent to Mr. Ford, on or before the 3rd June.

DEVON.—For the erection of a police station, &c., at Holworthy, Devonshire. Plans, &c., with Henry Ford, clerk of the Peace, Castle of Exeter, and at the office of Mr. A. Cohan, Clerk to Justices, Holworthy. Sealed tenders, endorsed "Tender for Holworthy Police Station," to be sent to Mr. Ford, on or before the 29th April.

QUAY.

ROCHESTER.—For the erection for the Corporation of Rochester, of a town-quay and landing-place, at the said city of Rochester. Drawings, &c., at the office of Mr. Henry

Andrews, surveyor, Rochester. A bill of quantities of the proposed work can be had of the surveyor on payment of fee of 10s. 6d. Tenders to be sent to the offices of Richard Prall, jun., town clerk, High street, Rochester, not later than twelve noon, on the 30th April instant, sealed and directed to the Mayor, Aldermen, and citizens of the city of Rochester, and endorsed "Tender for erection of Town-quay and landing-place."

FARM BUILDINGS.

LANCASHIRE.—For the erection of several farm buildings, at Ince Blundell and Formby. Plans, &c., with Mr. Madden, foreman of joiners, Ince Blundell. Tenders to be sent before the 10th May, to Mr. T. P. Fisher, steward, Ince Blundell.

BREAKWATER.

ISLE OF MAN.—For the construction of a breakwater, of 1,100 feet length, or thereby, at the Harbour of Douglas. Plans, &c., at the offices of the engineer, James Abernethy, Esq., M.L.C.E., 3, Parliament-street, Westminster. Sealed tenders, endorsed "Tenders for Breakwater," to be delivered to Richard Quirk, Receiver-General, Douglas, Isle of Man, on or before the 1st May.

RIVER WORKS.

CAMBRIDGE.—For the repair of the walls of Baitshite Sluice (about three miles below Cambridge), and for supplying the same with new oak doors and floodgates for the Sluice Pen; new bridges over the floodgates and overfall, and other works. Specification with Clement Francis, Clerk of the Conservators, Cambridge. Sealed tenders to Mr. Francis, on or before the 30th inst.

RAILWAY WORKS.

CARLISLE.—For the construction and alteration of works required for the enlargement of the Citadel Station, Carlisle. Drawings, &c., with forms of tender and schedules of prices, at the Citadel Station, on and after the 19th inst. Sealed tenders must be delivered not later than the 29th addressed to the Secretary, at the Citadel Station, and marked "Tender for Works."

CALEDONIAN RAILWAY.—For the construction of the Stonehouse Branch, about 4 miles 38 chains in length. Plans, &c., at the office, in Glasgow, of Mr. George Graham, the Company's engineer, where duplicate schedules and blank forms of tender may be had, price one guinea. An assistant engineer will attend at Stonehouse, on Friday, the 11th, at 12 o'clock, to accompany intending offers over the line. Sealed tenders, addressed to the secretary, at Glasgow, must be lodged with him on or before 28th April.

EXETER.—For the erection of a roof for the new station at Exeter, of the Bristol and Exeter Railway, having an area of about 500 squares. Drawings, &c., at the Engineer's Office, Bristol Terminus, to the 5th of May. Sealed tenders to be addressed to the Secretary, A. Moore, Esq., on or before the 6th May.

DRAINAGE.

SOMERSET.—For certain works to be done for accelerating the draught of water in the river Kenn, or Great River, and improving the drainage of lands in the several parishes of Backwell, Chelvey, Brockley, Nailsea, Yatton, and Kenn affected thereby, and for improving the outlet of the said river at Hook's Ear, in the parish of Kingston Seymour, Somersetshire. Plans, &c., at the offices of Messrs. Townsend and Jeffers, surveyors, Shannon-court, Bristol, under whose superintendence the works are to be carried out. Tenders (marked "Tender for Sewers Work") sealed to be sent to the offices of Messrs. Townsend and Jeffers, before or on the 30th April by 4 p.m.

BRIGHTON.—For constructing a main sewer and outfall in the Brunswick-square and terrace district. Plans, &c., at the office of R. G. Suter, Esq., the surveyor of the Commissioners, at their rooms in Brunswick-street West, Hove. Tenders in writing, sealed, and endorsed, "Brunswick-square and terrace drainage," are to be delivered on or before 5 o'clock on the 30th April, at the offices of Messrs. Hill and Fitzhugh, solicitors, Brighton.

GASWORKS.

KENT.—For the performance of the work required in the extension of their retort-house and coal store, and alterations in other parts of the works, at the Gravesend Gasworks. Plans, &c., at the Company's Works, Gravesend, and further information of Mr. J. Church, C.E., Chelmsford. Forms of tender may be had from Messrs. Southgate and Son, secretaries, Gravesend, and tenders are to be sent or delivered there on or before the 30th instant, marked "Tender for Building."

RESERVOIR.

FYLDE.—For the construction of a reservoir, upon the Grizedale Brook, about three miles from Garstang, and near Scorton Station, on the Lancaster and Preston Railway; and a reservoir near Weeton-lane Ends, about three miles from the Kirkham Station of the Preston and Wyre Railway, for the Fylde Waterworks Company. Plans, &c., and all information obtained at the office of Mr. T. B. Foster, C.E., 23, John Dalton-street, Manchester, from whom specifications and forms of tender can be obtained on payment of 10s. for each reservoir. Tenders must be sent in to Mr. T. A. Wilkinson, the secretary of the Company, at the Fylde Waterworks Office, Kirkham, not later than the 28th inst. The reservoirs will be let in separate contracts.

ROADWORK.

BOOTLE.—For pitching, paving with sets, and macadamising Merton-road, in the township of Bootle. Plans, &c., at the Assistant-Surveyor's office, 3, Phoenix-terrace, Derby-road, Bootle. Sealed tenders addressed to the Chairman of the Board, and to be delivered on or before May 1, at 12 noon.

STABLING, &c.

DUMFRIES.—For stabling and other offices at Drumpark, in the parish of Irongray. Plans, &c., from James McKie, writer, Dumfries, to whom tenders on or before 30th April.

EDINBURGH MONUMENT TO THE 78TH HIGHLANDERS.—This monument has been inaugurated with military honours; it consists of a Celtic cross of Redhall stone, including the pedestal, 27 feet in height. The pedestal is double, and the shaft, with the cross by which it is surmounted, is a monolith 15 feet 6 inches long. It is bordered on all sides with interlaced tracery in the old Celtic fashion, and is covered on three sides—in letters in the style of the 13th century—with the names of 7 officers, 28 non-commissioned officers, and 220 private soldiers of the 78th Regiment, who fell in the Indian mutiny. On three sunk panels, in the lower part of the pedestal, are inscribed the following actions in which the regiment was engaged during the mutiny:—Fintellpore, Aoung, Pandoo, Nuddi, Cawnpore, Ounoo, Busseeratungge, Boorbenkechowkee, Bithoor, Passage of the Ganges, Mungurwar, Alum-Bagh, First Relief of Lucknow, Defence of Lucknow, Defence of Alum-Bagh, capture of Lucknow, Bareilly. On the upper part of the pedestal, fronting the Esplanade, there is a dedicatory inscription in Gaelic, and underneath it the following translation in English: "Sacred to the memory of the officers, non-commissioned officers, and private soldiers of the 78th Highland Regiment, who fell in suppressing the mutiny of the native army of India, in the year 1857 and 1858, this memorial is erected as a tribute of respect by their surviving brother officers and comrades, and by many officers who formerly belonged to the regiment. A.D. 1861."

BRISTOL.—A meeting of the committee formed to promote a local memorial to the late Prince Consort, has been held at the Council-house, Bristol, under the presidency of the Mayor. Subscriptions to the amount of £370 were announced, and full confidence was expressed that the necessary sum would be obtained. In reference to the form of the memorial, it was resolved that a statue should be erected, and if a sufficient amount were subscribed, that the memorial should present a statue and fountain in harmonious combination. With a view of enlisting the co-operation of the working classes, a sub-committee was appointed to open the way to negotiations with some members of their body. A subscription list, it is said, will be shortly issued.

THE INTERNATIONAL EXHIBITION.

ELL has the Poet Laureate written—

"Uplift a thousand voices full and sweet,
In this wide hall with earth's invention stored,
And praise th' invisible universal Lord,
Who lets once more in peace the nations meet,
Where Science, Art and Labour have outpour'd
Their myriad horns of plenty at our feet.

O, silent father of our Kings to be,
Mournd' in this golden hour of jubilee,
For this, for all, we weep our thanks to thee!

The world-compelling plan was thine,
And, lo! the long laborious toils
Of Palace; lo! the giant aisles,
Rich in model and design;
Harvest-tool and husbandry,
Loom and wheel and engine-ry,
Secrets of the sullen mine,
Steel and gold, and corn and wine,
Fable rough, or fairy fine,
Sunny tokens of the Line,
Polar marvels, and a feast
Of wonder, out of West and East,
And shapes and hues of Art divine!
All of beauty, all of use,
That one fair planet can produce,
Brought from under each star,
Blown from over every main,
And mixt as life is mixt with pain,
The works of peace with works of war.

O ye, the wise who think, the wise who reign,
From growing commerce loose her latest chain,
And let the fair white-winged peacemaker fly
To happy havens under all the sky,
And mix the seasons and the golden hours,
Till each man find his own in all men's good,
And all men work in noble brotherhood,
Breakiog their mailed fleets and armed towers,
And ruling by obeying Nature's powers,
And gathering all the fruits of peace and crown'd with all her flowers."

Few there were, yesterday, who heard the "thousand voices" unmoved.

Once again, after an interval of eleven years, England has invited the world to a friendly contest, and throws wide open the doors of the vast building wherein their several contributions have been collected. The show has been inaugurated with all the splendour which royalty can command, although, through the unavoidable absence of the Queen, the ceremony lacked that magnificence which was diffused over the former building. A sense of the nation's loss, as was foreseen, was, moreover, felt by every one present, in that he who made doubts disappear like morning mists before his bright intelligence, and directed the current of our actions, slept his last sleep, and could not welcome the bidden guests, or look upon the consummation of his work. The "father of our kings to be" was silent when the labours upon his great enterprise were ended, but the result has shown that, powerful as was his guiding spirit, the means which he employed for the accomplishment of his ideas were sufficiently self-sustaining to march unflinchingly onwards and fulfil the task they—at his instigation—had undertaken.

When the former International Exhibition was opened, it was fondly hoped that we had entered upon a new era; that the rivalry of the sword and musket was to be exchanged for that of the shuttle and the loom; that the long-nursed deadly feuds of neighbours were to be brushed away by the olive branch; that hands gripped in friendship would close no more in anger against each other; and that even the common sense of nations would teach them lessons which ruin, slaughter, and misery had failed to impress upon them. These Utopian hopes have been dissipated. We must acknowledge the fallacy of these expectations which our hopes had begotten. In the brief interval since 1851 war has cut its deep channels in thousands of human hearts, and has left its track upon the seared face of many countries. We have ourselves passed twice through the fierce fiery ordeal, and our kinsmen over the Atlantic endure it even now with the obstinacy of the Anglo-Saxon race. We must also own that for months the materials for war, in the shape of monster cannon and plated ships, have been most prominent in the minds of our scientific men, and that perhaps the most attractive trophy in the whole collection will prove to be that which is contributed by the successful manufacturer of destructive weapons. It is humiliating to us, as people calling ourselves civilised, to make this confession, but the acknowledgment of its truth need not depress us. It is consolatory to know that even in this branch of manufacture England can maintain her proud pre-eminence amongst the assembled nations, whilst it is satisfactory to reflect that there is enough of more ennobling materials gathered together to convince us that whilst with one arm we can defend the world's sanctuary, we can with the other contribute in no mean degree to the onward movement of civilisation.

The general view of the interior of the new building cannot for one instant be compared to that of its prototype. We remember with regret Osler's Crystal Fountain, and the long stretch of perspective which the eye embraced in the former building, with its admirable coloured surfaces and its well arranged trophies, its green leafy elms and lines of judiciously displayed statues. The new building is short in comparison, and the enclosure of the courts limits the view. There is no connection between the bright colours of the roofs and that of the groups below. The dead green columns destroy the harmony of the internal colour, and the confused disposition of the trophies block out even the limited view of the building.

No art has been shown in placing them. Bell's Egyptian Obelisk is incongruously balanced by a Gothic Drinking Fountain. Both may be, in their respective styles, very excellent, but they have nothing in common with each other which should have justified the Commissioners in placing them, or in allowing them to be placed, in juxtaposition; and Thomas's last work is put into a side court! Gates of the Colebrook Dale Company, surpassing in size and splendour even those which were exhibited in 1851, and which now adorn the long walk of Kensington Gardens, are at the end of the south transept, hidden, or almost so, by neighbouring objects. How different from their deservedly prominent position in the Hyde-park building! As to a view down the nave, such as we obtained from the end gallery through the long range of 1,800 feet in the former building, we must not expect it here. Such a conglomeration of confusion as Cheapside presents when densely crowded we may have, but nothing beyond it.

A few days previous to the opening the eastern dome underwent a most charming transformation. To prevent a reverberation from the orchestra, a tent-like covering was put over it, which completely hid the cold vacant nakedness of the dome. It was really a relief to look upwards with that shield between us and the much vaunted wonder, whilst the alternate pale blue and red tints of the canvas gave a subdued and refreshing tone to all beneath it. Never before was the absurdity of these huge abortions so manifest, as when a simple tent-roof temporarily introduced hid one of them from our sight. We hope that no feeling of false pride will induce the Commissioners again to reveal it, but that a tasteful feature unexpectedly introduced at one end of the building will be repeated at the other.

We cannot avoid the expression of our cordial congratulations to the contractors and their assistants upon the successful completion of their uninterrupted labour. No more striking trophy of undaunted and untiring energy is contained in the building than that which the building itself presents, and no one hardly can appreciate it who has not watched it, as we have done, from the first moment when Messrs. Kelk and Lucas walked over the green turf which it has displaced down to the period when the Duke of Cambridge, amidst a flourish of trumpets, echoed by a salvo of artillery in Hyde-park, announced the opening of the building. Through its various successive stages, with the determination to an eighth of an inch of the relative position of each column, the screaming of the little engine, the swift upraising of the massive columns and girders, the adjustment of the roof principals, the watchfulness and care which riveted together those monstrous domes, the anxiety of mind and ceaseless toil of nobly labouring men, have ever had our sympathy. The contractors made a bargain they spared neither money, brain, nor muscle, and have completed it. We would ask the wondering thousands who will collect beneath those arched ribs and wide-spreading girders to remember, sometimes thankfully, that little army of working-men, with their selected officers and capable chiefs, who made a shelter for those acres of treasure which enchants them.

We have already mentioned some of the marvels of art which will be shown together in what is called the Mediæval court, but Gothic art has burst the limit of that insufficient boundary. Skidmore, at the head of metal-workers, stands proudly forward in the south-east transept. There, too, is Hart, with a gorgeous display of his well-known articles. Beneath the gallery, Earp the carver, exhibits some of his best workmanship, designed by Mr. Street and Mr. Bentley. Near him is a doorway, most elaborately sculptured by, if we recollect rightly, Mr. Poole—a name, we confess, unfamiliar to us, but evidently not long to remain so. Johnston Brothers show a good collection of metal work, and in the rear of it some of the things sent in competition to the Architectural Museum are displayed. Mr. John Bell's obelisk—without a straight line in it—hardly justifies the rumours which have been circulated about it; and Minton's matchless majolica fountain is at present incomplete, in consequence of the orchestra temporarily occupying a portion of the space allotted to it. In the north-eastern transept the colonies show a splendid collection of different woods, some polished and some in the rough, but the necessity for piling up those ugly rival masts of timber is not so palpable as the beauty of the smaller specimens of the wood. In the nave, besides that of Mr. Bell, there is an obelisk of grey granite from Aberdeen, elaborately incised with Greek ornament and gilt. In the northern courts there are some good specimens of wall decoration by Kershaw and by Hayward of Newgate-street, but we have not space at present to particularise them, or to detail the beauties of the painted cabinets which line the neighbouring enclosure. A high and lengthy casting, of unusual excellence, stands in front of the French department. The court itself is divided into recesses like those in an Eastern bazaar, each being devoted to some special kind of manufacture. We noticed two recesses occupied by articles of building construction, prominent in which were specimens of imitation marble and stone, and beautifully clean castings of finials, &c. The wall decoration is also distinguished by that brilliant and harmonious colour which characterises our neighbours' works. Retracing our steps for a hurried glance at the Architectural drawings in the north-eastern gallery, we find ourselves in the midst of the best works which have within the last few years adorned our several exhibitions. It is a real pleasure to find that our great architects—if they have not sent new drawings—have at least furnished up and forwarded their old ones. Even the President of the Institute contributes a drawing, and Professor Donaldson two or three. Mr. Scott sends the fine drawings of the Foreign-office, with Mr. Thomas Allom's easily recognised touch upon them. In fact, it is curious to notice how many drawings appear here displayed by his dexterous hand. "The Design for a City," by Mr. Kendall, which was

honourably noticed at Paris, is one of these; and it is not too much to say that, to the able artistic treatment it has received, it is indebted for a greater portion of its merit. Another scarcely less able colourist brings out, with his marvellous pencil, the beauties of Messrs. Digby and T. H. Wyatt's military chapel, and is recognised at a glance again in Mr. Ferrey's, Mr. Searle's, and some dozen other drawings, bearing the names of different architects. Would it have been too great a sacrifice to have "rendered unto Caesar the things which are Caesar's," and to have acknowledged, in an exhibition of this kind, the names of the artists who have helped the architects to a proud distinction?

Amongst the most prominent drawings is a design for the restoration of the Tomb of Mausolus. It comes boldly from the hand of Mr. Fergusson, who has, as our readers are aware, criticised somewhat severely Mr. Newton's, or rather Mr. Pullan's restoration; a comparison of this drawing with Mr. Fergusson's other contributions show very plainly that his "assistant," in preparing it, was also worthy of being mentioned, and of having his services publicly acknowledged.

Of designs for the Government offices there are many, as also there are of the Manchester Assize Courts. Professor Kerr shows by his work that his recent appointment was a worthy tribute to the talent of an able man. Mr. Newton has a large drawing, in which we admire alike his skilful delineation and his powerful conception. His drawings for years past have been distinguished by the same large grasp of subject and the like vigorous representation of it. Several designs for the embankment of the Thames caught our eye, but, above all, did that well-known one by Mr. Thomas Allom, which some years since adorned the walls of the Academy. Mr. Arthur Allom lays once more before us his best work,—the design for the interior of a public bath—together with his Royal Academy gold medal drawing. The indefatigable Mr. Hayward shows us a Gothic adornment of the Thames banks, but, clever as it is, it does not reach the grandeur of Mr. Allom's design.

We were glad to find here that the custodians of Sir C. Barry's drawings have given foreigners an opportunity of examining the productions of, perhaps, the greatest of modern architects. He is represented not only by his designs but by his early studies; the same remark applies to the drawings of Mr. Digby Wyatt. Sir Chas. Barry's sons maintain, in a great degree, their father's high renown. The drawing of St. Giles' Schools show Mr. E. M. Barry's most picturesque work, whilst the designs of Banks and Barry remind us of the father's power in Italian design. Mr. White, who has of late been too frequently absent from our architectural exhibitions, appears once more to delight us with his familiar handling of mediæval forms; and Mr. Street, as usual, has his unequalled pen-and-ink sketches set like gems in the coloured works of his brother architects. Our space will not permit us now to do more than record the impressions of a hurried visit to the two galleries; but we can say, without fear of contradiction, that a finer collection of architectural designs and drawings were, perhaps, never before collected together by English architects. Our foremost men seem really to have awakened from their long sleep to own their calling, and to vindicate their reputations. We miss only him—"the bravest of them all"—the old man who, eloquent, with the enthusiasm of youth, can speak of the occupation of his manhood; who, if he has not plentifully embodied his thoughts in brick and stone, has never, by a line or moulding, disfigured a building, but has made the structures that he has reared monuments of his cultivated genius to guide the architectural student in his forward course, and to stimulate his exertions. It is a drawback on the attractive features of the Architectural gallery that it contains nothing from the hand of the accomplished and esteemed Professor Cockerell.

ST. GEORGE'S CHURCH, BENENDEN, KENT.

WE are asked to add to our notice of the works at this church that the restorations have been carried out from the designs of Mr. D. Brandon. The nave piers and arches, and the nave roof, formerly of Classical design, are now replaced by Gothic work of fifteenth century character, in accordance with the style of the architecture of the windows of the aisles and chancel. The chancel is divided from the chancel aisles by clustered columns, and covered with a new boarded roof, formed into panels and decorated with coloured ornament. There is also a new handsome open roof, of the Perpendicular period, over the nave. The east window is filled with stained glass by Mr. Wailes, and below it, and round the communion walls, a reredos has been painted, harmonising with it in colour. Oak benches are provided in the chancel for the choristers. The aisles and chancel are paved with Minton's tiles. The character of the old church has been preserved as much as possible, but on the south side of the church it was found necessary to rebuild three of the bays, the original tracery of the windows having almost entirely disappeared. The external repairs and new work have been executed in local stone, and Bath stone has been used in the interior of the church.

The east window is erected to the memory of the parents of Mr. Gathorne Hardy, at whose cost the whole of the works have been carried out by Messrs. J. and C. Panson.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—On Wednesday last week the third *conversazione* of this Society took place at the Galleries of the Society of British Artists, Suffolk-street, Pall-mall. The rooms were crowded. The music comprised a selection from the works of Mozart. The grand quintet with wind instruments, a composition so rarely heard, was admirably played by Mr. Alfred Gilbert, Messrs. Smith, Pollard, Nobbs, and Standen. The vocalists were Mlle. Gapepa, Madame Gilbert, Miss Susanna Cole, Madame Elwood Andrea, Mr. Gaynor, Mr. Richard Seymour, Signor Ciampi and Herr Fornes. Mr. Alfred Gilbert, in conjunction with M. Benedict, undertakes the musical arrangements of the society.

THE METAL-WORK CHOIR-SCREEN AND CORONA FOR HEREFORD CATHEDRAL.

AMONGST the most interesting, and also the most instructive, works that appear in the Great Exhibition, the place of honour must be assigned to those which, while they are distinguished by merit of the highest order, are strictly typical in their character—true examples of what may be systematically achieved in either art or manufacture for a definite purpose, and neither mere experiments nor exceptional illustrations of clever eccentricity and ingenious caprice.

The metal-work choir-screen for Hereford Cathedral, that stands a little to the south of the eastern dome, is pre-eminently a typical work, and it may claim to be regarded as one of the most valuable exponents of the true condition of the art-manufactures of England. It shows what is now being done in this country in the highest department of metal-work; and it shows this without any direct reference to the Great Exhibition. It was not produced for the Great Exhibition, or with a view to being exhibited there; and it now appears at South Kensington simply because, having been just completed, it might fairly be held to exemplify its own class of productions. This screen was designed and executed for Hereford Cathedral, and in that noble edifice it is eventually to take its proper place. We are particular in directing attention to the circumstances under which this screen was produced, because we consider it to be most important to distinguish, in a Great Exhibition, between those works which have not been, and those which have been, made expressly for the purpose of being exhibited.

At the present time the capabilities of metal-work, or rather our own capabilities for dealing with the hard metals and for executing metal-work, are subjects both of general interest and supreme importance. In 1851 iron architecture as was exemplified by the first Great Exhibition itself, and was a bold step in advance of the time. Now, the mine has in a measure superseded the forest, and it aspires to rival the quarry. We are sedulously arming our ships of war with massive iron; and with iron still more massive we are preparing to render our land fortresses absolutely invulnerable. And, at the same time, notwithstanding the deplorable architectural shortcomings of the present Great Exhibition building, during the last few years an architecture proper, also of iron, has been gradually growing up amongst us, and it continually demonstrates, with fresh success, both the worthiness of its character and the versatility of its resources.

The growth of this iron architecture has very lately received a powerful impulse from the admirable restorations of the two cathedrals of Lichfield and Hereford, that have been effected under the direction of Mr. G. G. Scott, R.A. In each cathedral a new choir-screen formed a part of the design to be provided by the architect of the restorations, and both of these screens have been executed, from Mr. Scott's designs, by Mr. Skidmore, of Coventry, in metal-work, the metals employed being iron, brass, and bronze or copper. The whole is hand-wrought, and the processes employed are, for the most part, those that were introduced and applied with such grand success by the architectural metal-workers of the middle ages. The Lichfield choir-screen was fixed last year beneath the choir-arch of the cathedral, and it is doing its appointed work, and it has won a well-merited reputation. This reputation of the Lichfield screen determined the Dean and Chapter of Hereford to confirm the suggestion of their architect, that their new choir-screen should also be produced in metal-work, and produced by Mr. Skidmore. This second screen, being thus the latest architectural work of importance in metal, was first conceded by the Hereford authorities for a temporary sojourn at the Great Exhibition, before it should be permanently established in their cathedral. Visitors to the Exhibition who may study this fine work will see it to great disadvantage, from the circumstance that, being a true screen, it is not attempting, in the Great Exhibition, to do screen duty. At its two extremities it abuts upon nothing; it does not lead to or from anything; it neither shuts off one part of a building from another nor serves to connect together two different parts of the same building; and it has no association or sympathy whatever either with the edifice in which it stands or with its own multitudinous surroundings. It can well afford, however, to be dealt with and estimated exclusively on its own merits. All that it asks is, that it be regarded as a choir-screen, which is designed to stretch across, and to be covered by, the choir-arch of an English Gothic cathedral.

The composition is carefully adjusted as well to the office to be discharged by the screen in its screen capacity as to the natural qualities and capabilities of metal-work. It consists of an arcade of five great arches, the central arch being surmounted with a lofty pedimental canopy exquisitely crocketed with bunches of flowers and foliage, and each arch of the entire group being divided into two sub-arches. The shafts of the first order are clustered, but the slender shafts of the sub-arches are single. The principal constructive members are of iron, and very many of the minor details and of the decorative accessories are also executed in the same metal. The screen itself, indeed, may be entitled a grand example of iron filigree, so large is the proportion of the iron to the brass and copper, and so exquisitely delicate the treatment of this invaluable metal. The iron is variously painted, the colours having all been obtained from oxides of the metal itself, except the greens, and thus nature herself may be said to have painted this ironwork in the hues which she has provided for man's use through her chemical action upon iron. This colouring is at once consistent and agreeable, and it both harmonises and contrasts well with the burnished brass and the copper, to which important parts of the work have been assigned, and with the vitreous mosaics that sparkle

about the arch heads in such rich profusion. The capitals of all the shafts, the corbels which support the statues, the cornice, and the inner feathering of the central canopy, with various other details, are of copper, which retains its natural rich colour. In the execution of these beautiful members, Mr. Skidmore has put forth his full strength. They are triumphs of metal-architecture of the highest order. Wrought by the hand from the sheet copper, and executed with the point of the chisel after the method of the early metal-workers, these capitals demand especial attention and thoughtful study. They will be found to combine natural forms with architectural conventionalisms, the former retaining all their native grace and beauty, and the others adapting themselves with most felicitous propriety to the conditions of metal-architecture; the passion flower is repeatedly introduced, and it predominates in the composition of the central capital, and of the corbel which rises above it to support the figure of the Saviour, who is represented as in the act of Resurrection. This fine figure stands in front of a large pointed vesica-shaped panel, which is cusped and enriched with elaborate splendour. Above this panel is a circle, and higher still the point of the canopy rises into a cross, distinguished at once by the simple dignity of its form and the richness of its adornment.

On either side of the main central arch, corbelled out from the capitals of the arch shafts, is a group of two figures of winged angels, as in the act of adoration; and, on either side, in similar positions, two other figures of angels playing on instruments of music flank the entire composition. The lateral arches, with their sub-arches, are elaborately cusped with floral work; and the principal arch-heads enclose rich, open, quatrefoil panels. The shafts of these arches are in part brass and in part iron, the iron being overlaid with open-work traceries. The lower portion of the entire screen is grille-work of iron, of extraordinary richness; and, above the spandrels, are filled in with corresponding filigree of iron. Then there is the frieze of brass and mosaic, the cornice of copper conventionalised foliage, and the parapet of brass tile-work of great beauty and most original design. At present there is no cresting that rises above the ridge of the sloping tile-work, and it appears desirable, even should any cresting eventually be added, that it should rise only to a very slight elevation above the ridge.

One remarkable feature in the decoration of this fine work of art remains to be noticed. This is, the free use of a lustrous vitreous mosaic, which has been skilfully associated in broad masses with corresponding surfaces of burnished and jewelled brass. The effect thus obtained is brilliant in the highest degree. This brilliancy, however, it must be borne in mind, will be subdued when the screen is placed in its proper position beneath the choir-arch of Hereford. Then the whole of the colour, whether of these mosaics, of the brass and the copper, or of the painted and partially gilt iron, will be toned down and blended together in a manner that can scarcely be imagined, unless the spectator were to walk from the glare and the incongruities of the Great Exhibition direct to the choir of Westminster, or, better still, were to hasten direct to Lichfield, that there he might contemplate the companion screen in its own becoming place, or were to go to Hereford itself, and on the spot form his ideas of what will be the effect of its screen when it shall have been established in that cathedral.

Grouped with the screen in the Great Exhibition, as eventually they will be in Hereford Cathedral, is a magnificent gas corona, executed entirely in that ironwork which we have already designated filigree. This corona is conical in its general contour, and is composed of three tiers of arches, diverging from the central apex, the whole being filled with elaborate traceries. Seven bold standards for the gas radiate from the shaft, or pipe, which descends and forms the centre of the entire work. These standards rise beyond the extreme circumference of the conical outline, at right angles to the radiating pipes that support them, and thus they impart to the composition a most striking boldness, and convey the idea of strength and energy, through their contrast with the arches, and with the curved and flowing lines and the spirals. Each standard has a triple cluster of jets; and, in addition to these, the lower circle of the corona itself is studded with triple jets. The brilliancy of the gas, when it is lighted, will be greatly enhanced by the numerous pieces of crystalite, which are set in every direction about the jets themselves, and which sparkle so effectively amongst Mr. Skidmore's iron foliage. In the Great Exhibition the corona is suspended a little to the north of the screen—that is, rather nearer to the eastern dome. With these two noble objects there will be associated four standards of corresponding style and workmanship, severally destined to find their homes in the cathedral churches of Hereford, Norwich, Lichfield, and Calcutta.

It has been found impossible to complete the Hereford screen in anticipation of the opening of the Exhibition, notwithstanding the strenuous efforts that have been made, under the personal direction of Mr. Skidmore. When it is stated that the order for the production of this screen was not given until after the commencement of the present year it becomes a subject for astonishment that the work appears as perfect as we see it. By far the greatest and most important piece of metal-work that has been produced in our times, and without a superior amongst the noblest and grandest works of the artists in metal of the middle ages, the Hereford screen worthily succeeds the smaller, though, in no respect less artistic or less truly architectural, screen of Lichfield. These two works have introduced to us a new era in metal-architecture; and, as they themselves stand boldly in the front of the architectural achievements of our day, so they give promise of still greater things to come, when the principle of a new style of architecture shall have been recognised and thoroughly established amongst us.

ALLIANCE OF ARCHITECTURAL SOCIETIES.

ABOUT this time last year a spirited scheme, started by the Northern Architectural Association, was on foot, having for its object an alliance between all the architectural societies of Great Britain. This step had been proposed early in the year, and a sort of congress was finally resolved upon, which was to have taken place in London in last summer, but which, we believe, was never held. In fact, the scheme, so far as its immediate realisation was concerned, "fell through," and has remained in abeyance ever since. There can be little doubt, notwithstanding this apparent failure, that such an alliance would be very useful; and, as the approaching season would afford peculiar facilities for making the arrangements, it appears to us desirable to re-open the question.

It will not be necessary that we should endeavour to account for the non-completion of the alliance last year, nor have we all the materials for doing so before us. It is enough to note that substantial progress was made, since a very satisfactory outline of a scheme was drawn up and circulated. This year the preliminaries will be found ready to hand; and, as a far larger number of provincial architects will visit London in the course of this summer than have occasion to do so in ordinary years, the difficulty about a meeting of deputies will be less than it was in the last, or than it will be in any future year, supposing London to be the place of meeting.

The existence of independent architectural societies is very advantageous to the progress of the art and to those who practise it, and there cannot well be too many of them. The establishment of a means of frequent communication between them will be now the less a benefit, for if the views of an individual society, or a member of such a society, are enlightened and valuable, the more extensive the circulation given to them the more good they will effect. If, on the other hand, a society falls into error on any subject, it is far more likely that such error will be detected when submitted to extensive scrutiny, than when kept within the narrower limits of a single society or association.

The professional press no doubt affords, to an extent hardly, perhaps, sufficiently appreciated, the most extensive opportunities for general interchange of ideas. Few papers of importance are read before the architectural societies of which reports, more or less full, do not find a place in our columns; and few subjects of general interest arise which do not either appear in our correspondence or furnish the themes of our articles; and yet we, partly, perhaps, from this very circumstance, are in a position to know well that many communications, of a nature which either do not or cannot find a place in the columns of a public journal, might with advantage be addressed by various architectural societies to one another. There is a certain confidential feeling most properly existing between the members of any honourable profession, which might give occasion to much confidential intercourse, but as no communication made to or through a public paper can in any sense be called confidential, many statements or inquiries, to which this feeling would give rise were a proper channel opened, are of necessity now withheld altogether.

The ordinary run of papers, such as are usually read before provincial or metropolitan societies, will, it is true, be always suitably dispersed by the press, so far as their merit is enough to secure publicity for them. It would be, however, most desirable to be able to circulate among members of the profession questions upon the numerous points of what is generally called "professional practice," about which uncertainty prevails, or which custom, law, or circumstances have settled differently in different localities; nor would it be less useful to have a means of distributing information about local building materials, trade customs, methods of measurement, and even the prices of labour and materials. The internal polity, so to speak, of the profession—a matter often affecting individual interests to such an extent as to render it a most delicate and confidential subject—is subject to, or is in need of, occasional changes and variations, such as demand the attention of all interested, and require unanimity of action. The subject of competitions alone would suffice to illustrate what we mean; but there are many other subjects which are only less pressing than competition, which demand from architects first calm consideration, and then united action.

Such an alliance ought not to erect itself into a new society. It ought to embrace, if possible, all existing societies, for the purposes of a mutual interchange of information, and printed transactions, and of conference on important subjects; but doing this, it ought to leave the societies individually much as they existed before its formation. The affiliation of all societies to a central head is impossible, and, we believe, fortunately so; that central society could only be the Institute, and in the unalterable constitution of the Institute, the inflexible rigidity of which has so often and so justly been a matter of complaint, there is no provision for any such arrangement. The Institute, moreover, although it includes many country members, does not so thoroughly represent the profession throughout the country as to be in all points an efficient head, even if on abstract grounds a fusion under any—even the most unexceptionable—leadership were desirable or tolerable.

It further appears important that the arrangements should be so carried out as to secure the bodies of architects composing the alliance from the undue preponderance of any one society, or any group of societies. Supposing meetings to be held, at which delegates are to be present, the very fact that the meeting was held in any one locality might render the opinions of that locality predominant, inasmuch as all the local delegates could be easily present, while the distance might render the presence of delegates from the other extremity of the country quite impossible; and it even would seem to be desirable that, in any important matter, delegates should only form a sort of committee to draft resolutions or proposals, which could be

come the resolution, of the alliance, only after having been submitted to the societies themselves, and having received their approval.

Further, the difficulty which will, no doubt, be felt in getting together meetings of delegates, and the delay which must occur in procuring the assent of societies to any measure proposed to them by such a meeting, would seem to point out such a course as one to be reserved only for important matters, while ordinary subjects would be best dealt with by correspondence between the secretaries of the different societies and the circulation of papers.

While embracing the opportunity which an Exhibition year seems to offer for holding a Congress in London, we hope that the societies will take care as to the delegates they send. The scheme, even if it be referred back to the different societies for their adhesion or rejection after it has been provisionally agreed to by delegates, will yet depend for its complexion mainly on the character of the delegates themselves; and it is not, perhaps, going too far to say that the adhesion of some of the most important societies will depend very much upon the personal weight of the individuals by whom the matter is proposed to them, and under whose oversight and care it is likely to be. We write these words without hesitation, because we have no personal knowledge of the gentlemen who have already devoted time and trouble to the subject; their scheme, so far as we have seen it, appears so reasonable, that there can be little doubt of their fitness for conducting the matter to completion, but then they must be adequately supported; all the societies interested ought to take a part in the scheme and each one ought to endeavour to induce its most influential and sagacious members to give their personal assistance, and to bring their influence to bear.

The greatest difficulty in forming a league—be it political, social, or professional—is commonly found when it is attempted to unite large and small, or powerful and weak communities, on one common footing. The larger and more powerful feel that they have at best but little to gain, while they may have more to lose than their neighbours, and they are accordingly disinclined to trouble themselves in the matter. This difficulty may have to be encountered in the proposed alliance, but it must be overcome; of course an alliance of the associations in one district of the country will be so far useful that it will beneficially affect the societies which go to make it up. But to gain a position for the alliance, which shall make it influential throughout England, there ought to be no gaps; and, above all, the adhesion of the influential societies is indispensable. To secure the cordial co-operation of the London societies, and especially of the Institute, may be a matter of difficulty or of time; but the object desired will not be attained unless the Institute, the Association, and even such societies as the Architectural Museum and Exhibition, be included, and so included as to work harmoniously.

Should the Institute stand aside, we do not say that the promoters of the alliance should on that account abandon or postpone their scheme. They should still go on and show the Institute, by the results which they can obtain, how important an instrument has been created, and how desirable it would be for that body to take a share in the movement. Great changes are probably approaching—the voluntary examinations now about to be established—the many prizes now open for students—the possible changes in the Royal Academy—all seem to point to a greatly improved and elevated system of professional education; while in proportion as the profession advances in importance and in social position, its practice ought to become more uniform, and its feelings more and more dignified.

Unity is strength, and if the architects, connected together by a common profession and common interests, can, through the medium of associated societies, act like one man for certain important purposes, they will have a power which, as individuals, or as isolated groups, they fail to possess. The individuals who may be called on to exert themselves, and to give up time and trouble for the promotion of this end, need not consider their exertions as so much thrown away. That which is for the public good is also for the good of the individuals who form that public, and we feel quite sure that neither architects nor architectural societies will have cause to regret any time devoted to the formation of an efficient alliance, or to the working of it after it has been once formed.

COURTS OF JUSTICE.

AT the eleventh general meeting of the Law Amendment Society, held on Monday evening, at 3, Waterloo-place, Pall-mall, the Hon Mr. Headlam, Judge-Advocate, in the chair, Mr. Hastings, in drawing attention to the late vote of the House of Commons on the Bill for the Concentration of the Law courts, said he thought that, taking all things into consideration, and according to the usages of the House, the Bill might be brought forward again this session. This was the time to urge upon the Government to bring forward the measure. The Bill had nothing whatever to do with party politics, as it was brought forward by the society. He then referred to the inconveniences experienced by the profession owing to the present situation of the law courts and their offices, and described the advantages which the measure would confer upon the profession and the public at large. It had been stated that there was no fund to carry out the measure, but he thought the Sutors' Fund could be made available for that purpose. He concluded by moving the following resolution:—"That this society, deeply regretting the recent vote of the House of Commons adverse to the Courts of Justice Bill, reiterates the opinion expressed by the general meeting of the 17th January, 1859, in favour of a concentration of all the law courts and offices in a single building, and urges on the council the duty of renewing their representations to the Government and the Legislature in favour of this great practical improvement in the administration of the law."

The motion was agreed to unanimously.

THE LATE MR. JOHN THOMAS.

THE *Scotsman* says, Mr. John Thomas, the eminent sculptor, died at his residence, Florentine Villa, London, on the 9th April. He was born at Chalford, in Gloucestershire, in 1813, and has died in the forty-ninth year of his age. His extraordinary fertility of invention, wonderful rapidity of execution, and accurate knowledge in every department of decorative and architectural sculpture, caused him to be extensively employed by almost all the leading architects in the kingdom; and his works, whether in wood, metal, stone, or marble, were all characterised by elegance and originality. He was equally at home in every style, and master of every detail, whether Roman, Italian, or Gothic; and his productions are to be found in many of the principal structures in the chief towns of the kingdom.

Mr. Thomas had the honour to be extensively employed by the late Prince Consort, and executed, in a way to elicit the commendation of royalty, large bas-relief panels of Peace and War for Buckingham Palace, as well as similar works for Windsor Castle, Balmoral Castle, and others of the royal palaces. The model dairy at Windsor was designed and executed for Prince Albert by Mr. Thomas. The whole interior is lined with encaustic and Majolica, with characteristic figures, emblems, devices, and mottoes, executed in colour from the designs and models of Mr. Thomas. The enormous lions on the entrance piers at the Britannia Bridge, Menai Straits, each measuring nearly thirty feet in length, were executed by Mr. Thomas; and, even in their gigantic dimensions, display symmetrical proportion and masterly conception. The large bas-reliefs in the station at Euston-square, as well as the pediment and figures in the front elevation of the Great Western Station, are also the production of Mr. Thomas. The sculpture at the new works at the Serpentine, as well as that at the grand entrance gateway to Buckingham Palace, are also by him; and these are but a tithe of the innumerable productions of his extraordinary, industrious, and versatile genius. Public monuments have been erected by him in many of the chief towns in England; and, in addition to this, he was architect of several mansions, among others of which may be named Somerleyton, the seat of his early patron and friend, Sir Morton Peto.

In Glasgow are to be seen a few of the works of Mr. Thomas. The sculptures on the front of the National Bank and in the new telling-room of the Union Bank are specimens of his skill. Another work of his there, the beautiful mausoleum of the Houldsworth family, with its figures of Faith, Hope, and Charity, is a model of purity, both in its sculpture and architecture. The late Mr. John Houldsworth had his new house decorated and furnished by Mr. Thomas. The ceilings and walls of the principal apartments were enriched and coloured from his designs; and mantelpieces and doors of inlaid woods and marbles, floors of marquetry, marble statuettes appropriate to the rooms in which they were placed, tables, chairs, carpets, and curtains, all in unison, from Mr. Thomas's designs, rendered this house altogether a perfect specimen of the unity and harmony so much desiderated in internal furnishing and decoration.

In Edinburgh we have a few specimens of Mr. Thomas's works,—the architectural sculpture on the Life Assurance buildings in Princes'-street, the group of figures in the Masonic Hall, George-street, and the quaint figures on the unique fountain at Holyrood.

While carrying on a very extensive business as an architectural sculptor, Mr. Thomas applied himself to high-class art; and his figures of Musidora, Godiva, and others, exhibited in the Royal Academy, were received with well-merited commendation.

The forthcoming International Exhibition will, we understand, be enriched with several specimens of Mr. Thomas's skill. Messrs. Minton are to exhibit a large Majolica fountain, designed by Mr. Thomas, in the Great Western Transept. It is most elaborate, both in design and execution, and colossal in dimensions. But by far the most interesting production of Mr. Thomas to be exhibited is a model on a large scale of a monument to Shakspeare, the design for which, we believe, was submitted to, and approved by, the Prince Consort. The model is between twenty and thirty feet in height; the figure of Shakspeare, which is eight feet in height, is seated on a circular pedestal, enriched with figures from his works; and on each side, on ante-pedestals, are figures of Tragedy and Comedy. This design has been the dream of the lamented artist for many years, and there is some reason to fear that his strength may have been over-taxed by his anxiety and labour in connection with this model and the many other works he had in hand. The want of a national monument to our great national bard has been long felt, and it will be pleasing if this noble production, freely contributed, should be carried to completion, and erected on a colossal scale on some prominent site.

In private life Mr. Thomas was all that could be desired. He was on the most intimate terms with all the leading artists in London, and he delighted to be able to lend a helping hand to genius and worth. He was an agreeable companion, a kind friend, and a most affectionate husband and father. He leaves a widow, an only daughter, and many friends, to lament his death; while his works will carry his name far into futurity.

NEW RAILWAYS AND PUBLIC COMPANIES.—It appears from a return of the business transacted by the Committees of the Houses of Lords and Commons, that the Lords have passed thirty bills through committee, of which fourteen are for new railways, and sixteen for harbours, docks, water companies, and miscellaneous public purposes. The Commons have passed sixty bills, of which thirty-four are for railways and twenty-six for miscellaneous purposes. Only one railway Bill referred for consideration to the Lords has been thrown out; there have been ten thrown out by the Commons, and the following have been withdrawn:—London and Midland Junction Railway, West Hartlepool Harbour and Dock Extension, South Staffordshire and Central Wales, Dudley and Bridgnorth; London, Edgware, and Bushey; Market Drayton and Newport, Hull and West Riding Junction, Great Northern (No. 2) Bill, Ellesmere, Oswestry, Ruabon, and Shrewsbury Carmarthen and Cardigan (increase of capital and extensions). The only bill that has yet received the Royal assent is the bill of the Great Northern, for taking additional lands at Doncaster. There is a great deal of work yet to be done by the committees of both Houses before the shoal of bills, amounting to about three hundred, is disposed of, although a great number of them will pass through unopposed.

MR. JAMES FERGUSON'S new work on the Modern Styles of Architecture is announced by Mr. Murray.

OXFORD WORKHOUSE COMPETITION.

THREE architects furnished designs for the proposed new workhouse at Oxford, and the drawings having been submitted to Mr. Aickin. That gentleman has reported thereon to the Guardians of the Poor as follows:—

GENTLEMEN,—In pursuance of your request, conveyed to me by your clerk, Mr. Jacob, I have the honour to report upon the three plans submitted to my notice, viz., one with modifications by Mr. Fisher; another, also with alterations, by Mr. Seekham, and a third by Mr. Castle, all architects of Oxford. My first proceeding was to view the site, accompanied by your Vice-Chairmen, Mr. Greenwood and the Rev. E. Fox, and if it be any satisfaction to the Guardians, I think the site exceedingly eligible, and if they prove as happy in the selection of a plan to place upon that site the ratepayers will have no reason to complain. A question was put to me in reference to disposing of a portion of the frontage. This is purely a financial question, as there can be no doubt but that a large plot of ground can be made very useful in finding employment for the able-bodied inmates, and looking at the rapidity with which building operations are carried on in the immediate neighbourhood, an open space of a few acres will prove of considerable value to the City of Oxford, as affording it a necessary lung—and this rapid increase also forbodes the necessity of additional workhouse accommodation at a future time—I would therefore say, retain it.

The task of adjudicating upon a set of plans of any kind is no easy undertaking, but when they are for a workhouse—a building requiring such a variety of accommodation—the necessity for its being easy of supervision by one individual, that the classes should be properly separated, and that light and air should have free circulation, the difficulty becomes greater and the responsibility severe—added to which as I know by long experience what time, trouble, money, and anxiety a competition entails, my sympathies go heartily with those whose designs my duty requires me not to recommend.

I commenced my examination by viewing the original general plans which in all cases placed the infirmary in the rear, the main building next, and the lodge buildings in front, all parallel with and facing the road, with a drive up the centre of the site. In Mr. Seekham's amended plan the main building was reversed, and the entrance building at right angles with a roadway along the existing footway, known as Divinity Walk, and this arrangement has some advantages worthy of consideration.

I next ascertained if they each possessed the stipulated requirements, regardless of their suitability, and generally found them to have complied with the conditions, and then to find the area covered by each plan and its cubical contents, so as to form some idea of their relative costs. The following are the results:—

	Area covered by buildings in feet.	Cubical contents in feet.
Mr. W. Fisher	31,816	930,000
Mr. J. Castle	31,855	920,000
Mr. J. L. Seekham	32,099	860,000

Thus it will be seen that in the area covered and in their cubical contents little difference existed; another point also established being that supporting the gentleman's estimate of £7,000 to be correct, the cost per foot cube would be about 2d. Not having carried out any work in Oxfordshire, I am not prepared to say what can be done, but my experience in several parts of the country widely apart has been, that between 3d. and 4d. per foot is the very lowest sum for which a building of this kind can be executed.

Mr. Castle's Design.—Each set of plans was then examined in detail, when I found that Mr. Castle's design consisted of an entrance building, a main building of two stories, infirmary and detached chapel, distributed in masses for the purpose of effect. The arrangements, however, are such that it would render a proper supervision almost impossible. It will require but a few remarks to make it clear that it would be highly erroneous to adopt such a plan.

The master and matron's rooms are very inconveniently situated. There is only one ward for 55 able men, many of whom may be unruly; the lavatories are placed at the staircase entrances, which would be, in consequence, always wet and dirty; the kitchen department is inconvenient of access; the chapel cannot be reached but through the kitchen court; there is no communication from the able women's day-room to the dining-hall, but through the work-room and the yard.

Although the sleeping wards are 30 feet wide, windows are only placed on one side, and those very small; the room could not fail to be fetid and unhealthy. There are several other fatal defects, and it is a matter of regret that so much valuable time had been taken up in working out so inefficient a plan. The author has, however, succeeded in his endeavour to produce a pleasing and picturesque exterior.

Mr. Seekham's Design.—Mr. Seekham has sent in two designs. One appears to be a modification of the other, and as this latter is a manifest improvement, attention had better be directed to it. There are still several defects. The Master's rooms are too far from his work; the kitchen and sculleries have to be passed before reaching the main corridor, which has to be crossed to take the victuals to the dining-hall; the entrances will consequently smell unpleasantly, and would be difficult to keep clean; the ends of the corridor are blocked up with the refractory cells, which will prevent a thorough current of air passing through it; the sleeping-rooms for the epileptic are on the first floor. I think they would be better on the ground, and although "future extension" is written in large characters, considerable modification would have to be made previous to doing it.

The married rooms are too small, and one room has no window, while in plan No. 1 a false piece of construction is made to light it. The main building is three floors in height, and although not a positive error, yet it is evident that one of two floors could be more efficiently managed.

The Infirmary is also defective. The corridor is badly ventilated, and windows are placed on one side of the wards only, and on the first floor. Fever patients have to pass through one room into another, which is a very objectionable feature. There are other arrangements of a questionable character it would be needless to enumerate.

Mr. Fisher's Design.—Mr. Fisher's design, No. 2, although requiring alteration, is free from many of the objectionable features in the other two. There is much more system and compactness in it. The corridor is fairly lighted and ventilated. The Master's rooms, kitchen, dining-hall, and other offices are well placed, and the main building admits of unlimited future extension. The infirmary also is, by far, the best of the three, and so arranged as to be capable of

being well ventilated. I beg, therefore, to recommend his design for your adoption, with some suggestions which I have indicated in pened on his plan No. 2, and more clearly shown in the accompanying sketch. I propose to remove the octagon centre part, and to square the rooms to give to the Master an office and sitting-room on one side, and add an officer's dining-room on the other side. I have ventured to place the probationary wards in the main building near the entrance—the day and night nurseries to adjoin one of the able women's wards; the boiler-house, stores, brew-house, &c., to be alongside the dining-hall on the male side; the work-room, laundry, drying-room, and washhouse on the female side; and the married couples to occupy the space now allotted to the washhouse and nurseries in a one story building.

The chapel might be placed with advantage in the front, by which a more ready access from the kitchen department and stores to the infirmary might be had; and taking into consideration the fall in the ground, the principal stairs may be placed as shown, as it is probable the dining hall, &c., will be on higher ground.

Infirmary.—The convalescent rooms might be curtailed, and a nurse's day room on one side and a dispensary on the other might with advantage be secured. A communication should be made between the corridor and the eutaneous wards, and with the staircase of the fever wards, for the convenience of the surgeon and nurses.

The lodge department should have a wide entrance; porters' rooms and tramps' ward on one side, a waiting-room for paupers, a staircase and relieving officer's room on the other, and the board-room (which should be approached by two staircases, one for the guardians and one for the paupers), with committee and strong room on the first.

In venturing to make the preceding suggestions I have done so in the hope that they may be considered useful to the Board—as being the fruits of some experience in these matters. I have also gone into the subject of construction, and, having examined the specification, find it to be efficiently drawn up and the scantlings sufficient. I would suggest, however, that either flatter roofs be adopted or that some use be made of the existing space, which is a great waste; a slate course, consisting of two courses of slate breaking joint bedded in cement, should be inserted in all the walls immediately above the ground line to prevent damp rising. The drainage had better be collected into a tank, with, however, an overflow taken to the city sewer. The water from the city had also better be used, as wells and pumping lead to convenience.

GEORGE AICKIN.

With reference to the foregoing report, Mr. Castle writes to the Guardians—
"As a model workhouse—as a workhouse complete in detail and sub-classification—My plan is 'inefficient;' and it is so simply because it is cheap, and because the sum of £7,000, which you propose to expend, is also 'inefficient.' If I may be allowed to express an opinion, I should say the most efficient which has been sent to you is one or other of the three which you excluded from competition at once—for this reason, that all three were prepared upon the supposition that they would be entertained, irrespective of cost.

"The general remarks made by Mr. Aickin indicate very plainly that he made a rapid examination of my plan, and never read my specification. Had he done so, his remarks upon my windows and ventilation could not have been made. Nor would he have considered as vital defects some trifling points which could be rectified in five minutes without adding to the cost of the building. My plan may be good or bad; it is my own, and the cheapest I could design. Mr. Aickin admits that it complies with your instructions. Beyond that I can say nothing. But I must beg that you will place it with the rest of the plans and specifications in some public room where the ratepayers and general public may have an opportunity of seeing what has been submitted to you and what adjudication has been made. Such an ordeal will hurt no one. I know that my errors will reach me sooner or later, and a professional castigation, if it is just, may do me infinite service. So with the rest of the competitors.

Allow me to remark that at the present stage of your proceedings such an exhibition as I have suggested would be satisfactory to the competitors—for most of whom I can speak—and the general public anticipates that such a course will be adopted."

NEW WAREHOUSE, HARTLEPOOL.

A NEW warehouse is nearly completed, for the West Hartlepool Harbour and Railway Company. The building is 365 feet long, and 100 feet broad. The foundations are excavated 8 feet below the level of dock coping; the piles, nearly 900, are 20 feet long, driven 6 feet below the dock coping. Concrete, 3 feet deep, is laid in the trench; cross and longitudinal sleepers, 12 feet by 6 feet, are secured to the top of the piles; and, imbedded in the concrete on this foundation, Yorkshire landings are laid, 3 feet 6 inches broad, and 5 inches thick. On this the brickwork commences; after it has been brought to level of dock coping there is a base of ashlar stone on the outside, in four courses, making 5 feet in height, and from this commences a fire-brick facing to the full height of the building, which is about 64 feet, being five stories high. It is divided into three compartments by cross walls, except the top room, which is open throughout. The columns on the ground floor are of Dantzic oak, all above are of Memel fir; the beams and joists are all Memel fir; on the top of each pillar is a cast-iron saddle, so constructed that no weight is taken by the wood beams. The roof, all timber, is in one span. There are nine large openings on each side, 24 feet clear, with semicircular arches of ashlar stone, which, as well as the base courses, is "rock faced," and clean dressed in the openings. There is a stone and brick corbelled parapet all round the building, and eight pilasters, one at each angle and two on each side, having clean dressed ashlar caps; the two gables have stone and brick corbels and stone water tabling. A large semicircular window is placed in each gable.

The work was commenced in March last. Mr. Bastow is the builder.

NEW DRINKING FOUNTAIN AT CAMBERWELL-GREEN.—A new drinking fountain has been erected at Camberwell-green. It is the gift of Miss Caroline Edwards and the Metropolitan Free Drinking Fountain Association, and has been erected under the superintendence of that society. It is supported by four columns of serpentine marble, resting on a square solid pedestal. Under a dome four jets of water spring from the centre. The design is by Mr. Rolles, the surveyor to the association. This makes the eighty-sixth fountain which the association, with the well-known philanthropist Mr. Samuel Gurney at their head, has opened in London, and by the 1st July it will open eighteen more.

ARCHITECTURE OF PALESTINE, FROM THE EARLIEST TIMES TO THE CRUSADES.*

Permit me to offer you my heartfelt thanks for the favour you confer upon me in allowing me to present myself before you to address your honourable society. This is not the first instance of courteous hospitality which I have received since I have been in England, though it is the first time that I have undertaken to treat of my present subject—the Architecture of Palestine, from the earliest ages to the Crusades. I have made many investigations and gone very fully into the study, and I have great pleasure in imparting the information which I possess, and which I hope to communicate more fully in my forthcoming work, entitled “Jerusalem Explored.”

The limited time allotted for this lecture compels me to restrict my observations within the briefest space possible; hence I plead guilty, in anticipation, to the charge, which I fear may be brought against me, of dryness and want of minuteness of details in my descriptions. I wish it to be understood, however, that I shall be glad to offer any information or explanation to those who will apply to me, and that I shall gratefully accept any criticisms or observations which may be made to me. It now only remains for me to solicit your indulgent attention while I address you.

M. le Comte de Vogüé, of Paris, thus writes, in the introduction to his work upon the churches of the Holy Land:—“Passing by the ancient monuments, with which I was sufficiently well acquainted, through my first visit to Jerusalem, of twenty-four days’ duration, and with regard to which but little remains to be said, I have occupied myself in the search after monuments of the middle ages.” This is more than I can say, after a residence of eight years in Palestine, and more particularly in Jerusalem. I am compelled to own that much still remains for investigation and study in the monuments of antiquity, while those of the middle ages are well known, greatly owing, it must be confessed, to the labours of M. de Vogüé, who has rendered true service to science, although he has fallen into the error of ascribing all church architecture to the period of the Crusades. I shall reply to this in due time, and will now proceed to speak of the Jewish works, both before Solomon and during his reign, and that of Herod. Thence, I shall come to Constantine, Justinian, and the Saracens, in order to reach the period of the Crusades.

BEFORE THE REIGN OF SOLOMON.

The condition of the country of Canaan previous to the conquest of Joshua was not that of barbarism. It was certainly, to some extent, in a state of civilisation. Arts, trade, industry, and commerce were already considerably developed. We are not left ignorant that the country possessed “great and goodly cities, and houses full of all good things” (Deut. vi. 10, 11). But how are we to investigate the remains of its edifices? how ascertain their style of architecture? Certainly it is a study not unattended with difficulty. When the chosen people entered the promised land, they had come from Egypt, where art, trade, and luxury flourished. In the wilderness Moses found artists of sufficient ability to construct the tabernacle. It may, therefore, be inferred that they introduced their knowledge into Palestine; but where are the monuments in proof? We read that David and Solomon were obliged to apply to Hiram, King of Tyre, for artists and labourers to execute their magnificent works. It must be confessed that the want of monuments of this first epoch renders all research into the architecture of ancient Judea exceedingly difficult. The people whose name it bears have not even transmitted to us any historical notices on that subject.

I believe that, during the frequent excursions which I made into the country, I came across the remains of walls and arches of that date. The localities in which I discovered them, and their construction, I shall place before you, both by means of verbal description and by drawings.

Ephrath.—In the year 1729 before Christ, “Rachel was buried in the way to Ephrath” (Gen. xxxv. 19). Six hundred and thirty-four years afterwards Samuel said to Saul, “When thou art departed from me to-day, then thou shalt find two men by Rachel’s sepulchre in the border of Benjamin at Zelzah” (1 Sam. x. 2). Upon the road leading from Jerusalem to Bethlehem the monument of Jacob’s wife is still to be seen. To the east of this monument, at a distance of 400 feet, a very ancient wall is found. This I believe to have been that of Zelzah. The wall appears to be of Pelasgian construction. It is composed of large blocks of stone, measuring from 3 to 8 cubic feet each. The stones are of the greatest solidity at the base, and diminish in proportion as the vertical rows rise in height. These stones are formed into broad, flat polygons, and united together without cement, but with some degree of precision by means of small stones, employed to fill up the interstices resulting from their irregular conformation. The thickness of the walls at the foundation is 6 feet, above ground 5 feet; its present length extends to about 208 feet. Above the foundation are five rows of stone of unequal height, averaging from 8 to 9 feet. This relic of the past has been much mutilated by Arab vandalism, and portions of it used for the formation of fences.

That a city must formerly have existed on this spot is proved by vestiges of other walls, by an aqueduct excavated in the rock, and covered with large flat polygonal flags; by the fact that the surrounding soil abounds with hewn stones, with cisterns dug out of the rock, and with ruinous sepulchres, which serve as places of shelter for shepherds and their flocks. This wall, of which no author has made particular mention, has some resemblance to the walls of Mantineæ, which I visited in Greece in 1831. I have met with no other similar construction in any other part of Palestine.

Deir el Benat.—To the south of Bethlehem, and within an hour’s distance, lies the valley of Deir el Benat, which joins that of Etlam above the Arab village, now called Urtas. Upon ascending this valley for about a quarter of an hour, the traveller sees some ancient ruins, which I take to be those of Bath-Rabbim, of the Song of Solomon (vii. 4). An irregularly shaped space of ground, measuring 52,000 square feet, is surrounded by a wall 5 feet in thickness, and of unequal height, varying from 12 to 24 feet; on the east it runs up to the mountain; to the west it faces the torrent. On the latter side is a gate, 8 feet wide and 16 high, with jambs formed of several stones, supporting a round-headed arch, without the aid of a key-stone, which arch is composed, like the side posts, of stones worked in rustication. The entire wall is built of masses of rock, roughly squared, in combination with others of polygonal shape, but all more or less showing traces of rustication. The size of the stones in general is from two to four cubic feet. The spaces left in the wall are filled up with small stones, and

the cement, which is not observable in the exterior, is plainly perceptible in some parts of the interior of the wall. An examination of the cement convinced me that it was applied subsequently to the original construction. Within the space surrounded by this wall I discovered the rock hewn in such a manner as to form different apartments, but no internal construction remains. I, however, collected a number of small cubes of stone, which may be found in a small portion of the ground; they measure three or four lines each in surface, and form a mosaic, though without design. The gate is enclosed by a strong Arab wall. I endeavoured to get it opened, but the Arabs, who foolishly pretend to call themselves the owners of the place, forbade my entrance. Nevertheless, I succeeded, without the aid of bakshesh, in forming an aperture sufficiently large to enable me to see that the gate opened into a vast court, roughly hewn out of the rock, and that from it were two openings leading into other chambers. The walls bear the impress of the ages which they have seen pass away, but they are still firmly rooted in their original spot. The same class of wall is found at Lower Beth-Horon. As Solomon erected buildings in that locality, it might be thought by some that these were of his construction; but this is not the case. Such do exist, so that it is easy to compare them and observe that the one are much more ancient than the other.

The Sepulchral Valley of the Jews at Jerusalem.—In close proximity with the sepulchres of the Jews, on the north, lies a valley, which must be traversed to reach Neby Samuil, the ancient Ramah, the dwelling-place of the prophet Samuel. A short distance from the valley eastward are found portions of a wall composed of large rectangular stones roughly put together, without cement, mortise or iron. Among them exists a doorway 6 feet wide and 12 feet high, the side posts of which are each composed of a single stone, and support a monolith architrave 3 feet high, resting upon them without cement. It bears a resemblance, on a very small scale, to the door of the Treasury of Atreus, at Mycenæ. Of such constructions no trace is found after the period of Solomon. Throughout the whole of Palestine, nothing is to be seen so ancient as those I just described, and which I believe to be anterior to Solomon.

The works transmitted to us by the Patriarchs are necropolises, hewn out of the rock to serve for receptacles for the dead, as at Hebron; monuments erected over graves, like those of Rachel at Ephrath and Joseph at Sichem, formed of simple stones and without inscription; mausoleums, like that of Absalom at Jerusalem, the level surfaces used as threshing-floors, as at Ramah and Gibeah; and, finally, the vast reservoirs as on the way to Hebron. To all these works, perseverance and strength to overcome the resistance of the stone are plainly apparent, but the taste and genius of art are totally wanting.

Sepulchre of Samuel in Ramah.—It will not be out of place here to describe the construction of the sepulchre of Samuel in Ramah, which I have minutely examined. In ancient Ramah, now a village, called in Arabic Neby Samuil, exists a mosque which was formerly a church built by the Crusaders. The walls of this building are far from corresponding with the magnificence of its foundations, formed of enormous blocks of stone, which, though defaced, still show traces of careful and elaborate rustication. On the south-west side of this building stands another of the same period. This contains, or rather covers, the rock in which is the prophet’s sepulchre. By a door formed of iron grating, opened for me by the Dervish in charge, I entered a chamber cut in the rock; in the centre of this chamber is an enormous sarcophagus, which I recognise at a glance as a specimen of Moslem architecture, and which is the same that is exhibited with so much pretension and mystery through a hole, traversing the entire thickness of the rock, to persons not permitted to set foot upon the rock overlying the tomb of the prophet, but who are obliged to be content with remaining in the upper room, where there is another sarcophagus of wood. This sight did not, however, suffice for me. Upon examining the court, I perceived an opening, 10 inches in diameter, running through the rock and communicating with a lower chamber, which was utterly dark. Besides that, I saw a passage railed off with iron bars, and inferred, from the rusty state of the gate, that the Dervish himself never ventured to visit the old prophet, whom the Mussulmans declare to be still alive. All my endeavours to induce my guide to open this gate were fruitless. Though he persisted in seeking to compel me to retire, I accomplished my investigations as well as I could without him. By means of lighted paper thrown down the hole to which I have alluded, I discovered the existence, in the centre of the cavern, of a sarcophagus of whitish stone, of rectangular form at its base, surmounted by a triangular prism, without ornament or inscription. The walls of the sepulchral chamber were smooth, like those of the one in which I was. The smoothness retained the appearance of having been produced by a machine furnished with iron points, and which acted with a rotatory motion. I made the same observation from the horizontal grating, and perceived that the steps were cut in the rock itself. It is under the sarcophagus that the tomb, cut vertically in the rock, must be sought. In my examination I was favoured by fortune, or rather by the humidity of the place itself. Had it not been for this, the lighted paper which I employed would have ignited the petitions addressed to the prophet, and I should have been subjected to the wrath, not only of the custodians, but of the whole village.

FROM THE PERIOD OF SOLOMON TO HEROD.

During the times of David and Solomon, luxury increased among the Jews. The arts and industry greatly improved under the influence of Phœnician artists and craftsmen, who came to Judea in large numbers, and afforded the Hebrews the opportunity of learning their arts. Of the works accomplished by David, we have no indications or trace remaining. No doubt can be entertained that he furnished the means and planned the localities, and that his ideas were carried into execution by Solomon. The latter was not occupied, like the former, in fighting against the enemies and founding new institutions, and, therefore, was at liberty to devote his wisdom and energy to the augmentation of the splendour of his kingdom, by the erection of stupendous buildings, by commercial enterprise, and by the encouragement of luxury little in keeping with the constitution of the country. But of all his great works, what remains have we? The Scriptures inform us Nebuchadnezzar converted them into a heap of ruins by fire, employed men to raze the walls and fortifications, and carried the people into captivity. In the reign of Cyrus, 52 years afterwards; and 536 years before Jesus Christ, the exiles returned to their native land, rebuilt Jerusalem and the temple of the Lord, which did not equal the first in splendour, in consequence of which Herod substituted for it one far grander. The whole of the long period which elapsed between Solomon and Herod is utterly unproductive of monumental remains. We have certainly not a building, perhaps not even a capital, of the time. Of the latter, however, I speak doubtfully. The capital of the monolith found under the mosque of Akse is at present the subject of serious study and investigation, with a view

* Paper by Signior PIROTTI, Architect to the Pasha of Jerusalem, read before the Royal Institute of British Architects by the Rev. GEORGE WILLIAMS, April 28th.

to assigning it to the Solomonic or Herodian epoch. In Jerusalem and Palestine in general we have only blocks of worked stones, walls, reservoirs, and aqueducts of the period in question to discuss; and of these I will now proceed to speak.

The existing walls of Jerusalem, especially on the east, mark the various epochs at which they were built. At their base I recognise the work of Solomon's period; higher up, some portions of the walls as rebuilt after the captivity. Other parts show the refined workmanship of the Herodian age, while Roman and Saracenic work is not rare. The character of the Solomonic walls, as alluded to by Flavius Josephus (Book XV., chap. xxxi., 3) I recognised, on examining, the stones forming the foundation of the actual walls of Jerusalem. On the east, on which side I made deep excavations, in order to satisfy myself of the fact, the large stones composing the foundations vary in length, and are squared with some degree of exactitude. They have a smooth edge round the rustication about 2½ inches wide. The rustication itself projects about 3 inches. The stones are joined together by means of mortises cut in the stones, or by cubical clamps of lead and iron, but no sort of cement is apparent. Above the foundation, stones are seen in relief; hence those portions of the wall in which the courses of vertical and horizontal stones are uniform and well joined I call Solomonic, but where the construction is irregular, and the external surface of the stones shows the mortises for the tenons or for the clamp, I assign them to the epoch subsequent to the captivity. At that period the walls were rebuilt in the greatest haste, to resist the attacks of an enemy who might appear at any moment, as we find from the Book of Nehemiah; hence the inequality in their construction, and the laying of the stones face downwards.

The rustication, then, I attribute to Solomon, who undoubtedly employed it in a rough state in the foundations, as is clearly apparent, and also in the building of the towers, and more finely executed in the construction of the rest of the wall of the enclosure. The reason why so few remains of external walls of Solomon's time are to be seen, may be found in the devastations of fire, vandalism, successive repairs, and the new construction given to the stones during the period of Herod and Justinian. This I shall presently point out, and show that Herod himself employed rustication in some parts of his fortifications.

Speaking of the working of the stones of which the temple was built, Josephus remarks that they were polished and joined together in such a way that it was impossible to discover the joints. Of this no vestige remains in Jerusalem; time, fire and man have never spared the Eternal city, and we are compelled to turn elsewhere for other relics which evidence science and genius.

Solomon's Reservoirs in Etham.—To the south of Bethlehem, and at an hour's distance from it, upon the west side of the road which leads to Hebron, stands a ruined mediæval castle. This ruin looks as if it stood sentinel over three large reservoirs, which are not only, without doubt, the grandest work existing in Palestine, but are also, indubitably, of high antiquity, and may safely be assigned to the Solomonic era, in accordance with tradition. It is remarkable that neither the Bible nor Josephus directly describe them. The latter, however, in his Antiquities (Book VIII. c. vii. 3) mentions a city called Etham, where was erected the summer palace of Solomon, of which the Rabbis give so glowing a description. It is, probably, this palace which is referred to in Ecclesiastes ii. 4, 5, 6. Of the magnificent grounds, nothing remains but some land under excellent cultivation by Mr. Meshulam. This spot, which is situated to the east of the reservoirs, and in the northern continuation of the valley, retains the name of the Enclosed Garden (Can. iv. 12), in honour of Solomon. At various times, among others in May 1861, Meshulam, in digging the ground for cultivation, has met with the remains of ancient walls, reservoirs, and aqueducts cut in the rock.

The three great basins are situated in the Valley of Etham, which runs down from west to east with a very steep slope. They are fed by the rain water that flows down from the two sides of the mountain, and from a fountain situated to the west of the castle, in a direct line to its northern side, at a distance of about 450 feet. I state this because the entrance to the fountain, which is circular in form, is hidden by stones and difficult to find. Solomon probably alludes to this very fountain in his Song (iv. 12), and it is still called the Sealed Fountain. All the three reservoirs are cut out of the solid rock. In some parts they still retain a cement so hard that twenty-nine centuries have been unable to exercise any destructive force upon it. It seems perfectly clear that the primary object of the construction of these reservoirs was the supply of Jerusalem with water, as Mount Moriah is at the present time supplied, in consequence of restorations directed by myself. It is a subject of great regret that the repairs which have several times been executed are never suffered to continue long undisturbed, because the shepherds, fellahs—or peasants—and Bedouins, continually destroy portions of the conduit in order to procure the water for their own private wants, and it is difficult in an Arab country to maintain a proper watch over a circuitous line of about 15,000 yards. However solemnly the guardians may promise to fulfil the duties which they undertake, they are easily induced to slumber under the influence of the god Baksheesh.

The first reservoir to the west is 393 feet long, its average breadth is 225 feet, and its average depth 30 feet. The second, distant about 158 feet from the first, is 432 feet long, its width 225 feet, and average depth 42 feet. At a distance from this of 186 feet in the last, 477 feet long, 213 feet in average width, and in average depth 58 feet. All three unitedly occupy a square superficies of 179,541 feet, and 12,089,450 cubic feet of the rock from which they are formed. What conqueror or ruler of Palestine could execute so stupendous a work? It must be allowed that the glory of having effected it is due alone to Solomon's genius. But it is not only in the construction of these water receptacles that hydraulic knowledge and science are apparent: more especially are they displayed in the vast ramifications of the conduits which convey the water from great distances and various quarters; in the formation of various water-towers; in the contrivance for filtration; in the manner in which the water is introduced, without the least waste; and, finally, in the mode of its conveyance through the conduits to Jerusalem. I am sorry to be prevented, by the pressure of time, from entering into all these details, but I must not pass over the principal without more special mention. The others may be learned from a paper which it is my intention to print before long.

Let us return to the Sealed Fountain. Enter it by the opening, and descend a sufficiently inconvenient passage for about 14 feet. At the extremity we come to a rectangular chamber, 18 feet long, 10 feet wide, and 20 feet high, whose lateral walls are formed of large Solomonic stones. At the base they are rusticated, and on the upper surface smooth. The vault is a round arch, constructed of large stones laid in horizontal courses, nor does the keystone show. No cement is used in the construction. In the middle of the western wall is another

aperture, which leads to a small cavern, where a stream issues out of the rock. At the western corners are two other openings, in which springs are seen dripping from the rock. These three fountains deliver themselves into the rectangular chamber, in the middle of which is a reservoir to receive them. In this basin they are filtered previously to passing into the large conduit, which commences at the eastern wall. The conduit is cut in the rock for a great distance, but the upper part, as it approaches the old castle, is covered with large flat slabs. It is 3 feet wide and 4½ feet high. The waters of this conduit fall a distance of 20 feet at the north-west corner of the upper reservoir, where they are caught in a basin. From thence one part of the water is turned into the first pool, while another portion is conveyed by the aqueduct—which runs parallel with the reservoirs—to the point at which the waters of the reservoirs enter the water-tower, whence they proceed, by the conduit, to Jerusalem.

When the reservoirs are so full that they can receive no more water, to avoid waste the water is received in the basin near the castle, where there is a third aperture leading into a subterranean chamber. Here it unites with the other water, forms a new stream, and all flows together through a subterranean conduit dug in the rock to supply the water tower, from whence the conduit for Jerusalem runs. From the same point proceeds another conduit, which passes southward, at a distance of 600 feet from the third reservoir. This, in case of great abundance of water, could be directed into the valley for irrigation. The whole system of aqueducts has ceased to be of use, because the streams are not abundant; indeed, alone they would be quite inadequate to feed such vast receptacles. During the eight years of my stay it was only once—in 1860—that I saw the three reservoirs full. At other times, it is the second only that has water, and not always that. The whole length of the conduit running to Jerusalem is covered with large stones. In some parts it is constructed of masonry, in others, formed in the rock, and in a few small portions it consists of terra cotta tubes, of which I believe it to have been entirely formed originally. I must beg to be excused, on the ground of want of time, if I enter into no further details in connection with this interesting topic.

Mosque of Abraham at Hebron.—In Hebron, as every one is aware, is the cave of Maephelah, purchased by Abraham, and appropriated by him as a sepulchre for himself and his descendants. This cave is surrounded by a wall of the highest antiquity; but the precise date of its origin has not been stated by any writer. I have no hesitation in following the Arab chroniclers of the sixth and seventh centuries, as well as the tradition of the country, and declaring it to be of the Solomonic, and not of the Herodian, age. At the time of Josephus ("Wars of the Jews," Book IV., chap. ix. 11), the monuments of the patriarchs, in beautiful marble and of elegant construction, were still seen. Now, had they been erected by Herod, the historian would not have omitted to describe them when he speaks of other important works executed by the same sovereign, since he wrote not very long after the period, and was ever ready to magnify the monumental works of the Hebrews. We may reasonably infer that he does not describe it as Solomon's, because the fact was perfectly well known in his time; as Eusebius and Jerome, for the same reason, are silent about it when they name Abraham's sepulchre. Some have fancifully attributed it to Saint Helen; but it would appear that they have overlooked the assertion of Pelgrim of Bordeaux, who visited Hebron in 333, and describes this surrounding wall as constructed of stones of enormous size. Antoninus the Martyr, in the sixth century, makes like mention of it, but does not say that it was the work of the Byzantine Empire.

The north and south sides of the wall are 198 feet long, their width, from east to west, is 112 feet. The height of the ancient work is 48 feet. The walls are ornamented with pilasters of the uniform width of 4 feet, except at the corners, where it is double. All project 8 inches from the plain surface of the work. They are not ornamented with capitals, but support a cornice in high relief, composed of two fillets and a cyma reversa, and were evidently added, subsequently to the formation of the wall, for the express purpose of separating the old and the new. The latter, of Arab construction, it is easy to see was built only to conceal the enclosure from view. The whole wall is formed of regular courses of enormous stones perfectly squared and rusticated, five lines in projection relief, and which diminish in size in proportion to their elevation; each row receding five lines from the row immediately below. There are masses, and not a few, which measure 10 feet in length and 5 feet in height. This external form is maintained in the interior, but without the buttresses. The thickness of the walls is 7½ feet at the base, and 6½ feet above. As far as I had the opportunity of examining, two stones appear, in general, to form the thickness; while in some cases, a single one occupies the whole thickness. No cement is used in uniting the stones. The little which is apparent on the exterior has been placed there by the Arabs, as they themselves say, to prevent the rain from penetrating to the interior. Should any one offer objections to my opinion, I shall be greatly obliged, and shall avail myself of them on my return to Hebron to renew my researches and studies.*

KNAPP'S PATENT PAVEMENT. POULTRY.—As an experiment the roadway in the Poultry is being laid with Knapp's patent pavement, which consists of hollow iron blocks, divided into small compartments, filled up with concrete level with the surface. Four of these blocks will make a square yard. On each side of the road, close to the edge of the footway, are being laid hollow cast-iron tram-plates, six feet in length and 18 inches broad, which are first filled with concrete, and then turned over, leaving the indented iron face upwards, thus forming solid tramways. To keep the paving level at each end iron girders 18 feet 9 inches in length will cross the roadway. Each of the blocks are cast in the same mould so that the whole of them, it is said, will lock into each other, and form a solid mass of iron and concrete of great strength and durability. The work commences at the corner of Charlotte-row, Mansion-house, and extends about 100 yards westward from that point.

PARIS BRIDGES.—The old suspension-bridge of Louis-Philippe, Paris, is closed, and the new bridge, of the same name, which joins the islands of La Cité and of Saint-Louis, and which has been rebuilt in iron, has been opened to the public. The new stone bridge which joins the same isle, Saint-Louis, to the left bank of the river, has also been opened, although the parapets are not yet built. During the twelve years that the Emperor has occupied the throne, this is the twelfth bridge that has been either built or rebuilt in Paris—namely, the Napoleon at Berey, the Ansterlitz, Louis-Philippe, Arcole, Double, Notre-Dame, Petit-Pont, an Change, Saint-Michel, des Invalides, Alma, and Solferino.

ON LEAD WORK.*

THE subject of the paper for this evening first suggested itself as in proper sequence to the valuable contributions on stonework, joiners' work, and metal work, that have been given during the course of the session; for although lead work comes of course under the general title of Mr. Skidmore's paper, I had erroneously, as it appeared, imagined that he would have confined himself to the treatment of iron, the metal by which he has achieved a lasting reputation, and initiated us into the mysteries of the forge and the vice.

Those of us who were fortunate enough to be present at the delivery of his lecture will understand how much that was then propounded applied to all metal ornament, and especially to gold as worked according to his theory, and in an equal or greater degree to lead, as illustrated by his experiments. I think we shall do well to take up the study of lead work first, and when we have well understood the legitimate treatment of the one, we shall be better prepared to design in other and more precious materials. And, first, because we must inquire a little into the history of this much abused material, and trace it from its birth through the various processes of manufacture by which it is moulded to the wants and wishes of mankind. I have nothing new to tell you on this subject, but I dare say you will bear with me for a few minutes while I revive your recollections before we pass on from its history to its application. You will remember that lead exists only in one ore, called the sulphuret, which occurs in veins of varying thicknesses in the primary or transition districts, but most abundantly in the mountain limestone between St. Abb's Head and the Irish Sea. It is also found plentifully in Derbyshire, Shropshire, Devonshire, Cornwall, the Isle of Man, Denbighshire, Flintshire, and some parts of Ireland. The oldest mines are in Derbyshire, and the richest are those in North Wales, which yield fully one-fourth of all the lead in the kingdom. The average annual produce is about 50,000 tons, worth about £1,000,000, at the rate of £20 per ton.

To extract the lead from the ore, the sulphur is driven off as acids, and the metal is oxidized by the action of a powerful heat; a part of the sulphuric acid combines with the metal and forms sulphate of lead, to reduce which quicklime and coal are added during the process, the lime combining with the sulphuric acid, and the carbon of the coal abstracting the oxygen of the metallic oxide. The metal being reduced is collected in vessels, from which it is cast into large ingots termed pigs, and is ready for commerce.

At this stage, lead may be either rolled, or, as it is more generally termed, milled, or cast, or drawn. If rolled, a pig is passed through the rollers some 200 or 300 times, during which process a length of 6 or 7 feet will be increased to 400 by a breadth of 7 feet. If cast, it is run on to a table, and levelled off with a strike. It is difficult to insure a good casting if the lead is required to be under 6 lbs. to the foot, as pin-holes are apt to occur, which, hardly perceptible to the eye, may cause great damage if subject to the filtration of water; the only possible advantage in cast lead being that the purity of the metal is thereby insured. In their castings a linen cloth is stretched on an appropriate table over a woollen one, and levelled off with a strike, as before. In gauging the thickness of sheet lead, it may be useful to remember that 5 lb. lead is $\frac{1}{12}$ inch thick, and 10 lb. lead $\frac{1}{6}$ ditto, and 60 lb. lead is 1 inch thick; but the intermediate variations are too slight to be determined, except by the weight. Pipes are either drawn in lengths of 20 or 30 feet, or the melted lead is forced through a hydrostatic pipe press, and drawn out in an endless coil.

The use of sheet lead in buildings is of very early date. I suppose its application to roofs in Norman work was universal. The lead used was thicker than we consider needful, running sometimes as high as 12 lbs. to the foot. The lead taken down from the church at Braunston, in Northover, weighed 13 lbs. to the foot. The sheets were about 2 feet between the rolls, and the joints were formed by "seams," that is, the overlapping of the edges of the lead without the use of a roll; this practice continued to a late date, and may be seen in houses and churches of the last century. I met with a curious application of this method of jointing lead work in an account of some excavations that took place in the city. A pipe, made of sheet lead, found doubled round, was discovered at a considerable depth, about 3 inches in the clear diameter, the end joints butted together, and a solid casting enveloped them; the top joint was formed with a seam, in the method which I have described. I cannot form any estimate of the date.

Rolls offer greater security to the extreme edges of the lead, and, as they are particularly unpleasant things to tread upon, do not get so much knocked about with the feet. If the slope of the roof is great, the sheets are secured to the rolls with lead-headed nails, and the head covered with a soldered clot to prevent the wet entering. The size of a sheet of lead is 6 feet wide by about 16 feet long; this is cut in half longitudinally, and in lengths suited to the roof, $4\frac{1}{2}$ inches being allowed on each side for the lap over the roll.

We now come to the ridge, and here lead becomes of the greatest value; in fact, it seems the most natural form for sheet lead to assume, clinging, as it were, by its own weight to either side of the roof, and only waiting for the hand of man to give it an artistic finish. How shall we set about it? We have a series of rafters halved together or butting against a ridge, and boarded at the back; upright irons, split and forked to the proper angle, were secured to each pair of rafters of the required length; over this was slipped the lead ridge, the holes being previously made for the uprights, and the cresting, cast in two halves, was then applied and soldered together.

The example given is from De la Quernie's work in the British Museum, and is a beautiful illustration of what may be done in this way. Observe, too, the satisfactory effect produced by the serrated edge. Let us analyse this a little, and see why the eye allows this line to be right. Partly, I think, because the lead is economically distributed for effect; that is, it shows as many lines and as much surface as possible consistent with the work it performs. Partly, I think, because it suggests, if it does not really assist (as Garbett asserts), the downward flow of the rain water; and partly, because the continuous unsecured edges of a sheet are peculiarly liable to be caught and displaced by the wind; and, lastly, because it softened off the longitudinal lines of the cresting, and with its gentle undulation arrests the eye just where it is wanted.

In discontinuous ridges, that is, where the kingpost is carried up and treated ornamentally, a bar of iron traverses the whole length of the ridge, and is covered with lead; this forms a stay bar to the cresting, and is itself sometimes

erected. In slate roofs strips of lead were soldered on to the lower edge of the lead ridge, where the edge was left plain, and, passing under the slates, secured the ridge from accidental disturbance. You will find two examples given in Mr. Burges' account of lead work, the only one published that enters at all into the details of this branch of metal work as practised in the mediæval times, and to which I am indebted for a considerable portion of my information. In De la Quernie's work will be found an account of a beautiful lead cresting at the Hôtel de Ville de Paris, and the Cathedral of Chalons-sur-Marne.

The Palais de Justice, at Rouen, still retains its cresting, though partly mutilated in 1794. Rheims, S. Vulfran, Abbeville, Amiens, Noyon Cathedral, and above all Cologne, are, according to his account, remarkable for their lead cresting. The cresting of the choir at Rouen Cathedral terminated in an equestrian statue of S. George, which was pulled down in the 2nd year of the Republic, for the purpose of making shot—the lead itself was totally destroyed by fire in 1822. Some crests of a late date imitate balconies. The example shown is taken from De la Quernie, and shows us at least how variety of outline may be obtained—a feature most desirable in this prosaic metropolis, where something like this, with a few varieties of chimney-pots, seems the utmost ambition of the builder—I must not say architect; and this balcony outline leads me to say a few words on ironwork as usually designed. I speak for myself, when I say that no ironwork looks as satisfactory in execution as it does on the drawing; it always has more or less of a starved look, and the design generally seems impoverished; nothing is so bad a background for ironwork as the sky. I was noticing this only the other day, when I passed through Bedfordbury, and looked at the iron cresting on the new schools there. I could not but help wishing that our talented president had worked out something original in lead. I can the more freely criticise this building as it has been the subject of the prize medal conferred by the Society for the promotion of the Fine Arts.

We have but few specimens of ornamental lead work in England. The only example, and that of doubtful antiquity, in which a lead cresting occurs, is that at Exeter; the example is useful, in showing how the rolls may be made to finish under the lead ridge. A ridge terminating in the very same outline occurs in the Bayeux tapestry, 1066, on the castle of Mont St. Michel, or, as it is there called, "Ad Montem Michaelis." The gilded stars that are often seen on perpendicular roofs, especially over the altars, and which form such a favourite feature in the French finials, are usually formed of lead. In the absence of English examples we must go to our French authority again for a description of the *girouette* or *epi*, for we have no English term equivalent, except, perhaps, hip knob, which, unfortunately for our purpose, is rarely covered with lead.

The French word *epi* is used in the parish records of St. Laurent de Rouen as early as 1470, and being derived from spine, has a spiky and appropriate sound. It appears that they were indicative of the rank of the proprietor, so that a pennon ranked for a knight, and a banner for a knight banneret, and so forth. Coats were often employed for the termination of these *girouettes* as with us.

The most remarkable examples occur on the Chapel of the Virgin, at Evrenx; another on the Church of the Madeleine, at Verneuil; another on the Tourelle aux Pastourelles, at Rouen, and others on the Hôtel du Bourgtherould in the same city. This latter partakes of the fault of the building to which it belongs—excess of elaboration, but we may gain a few hints from it with profit; the terminal ornament is very graceful, and is frequently adopted in modern ironwork, the nest-like enrichments through which the seam passes are legitimate developments of sheet-lead ornament cut into foliated forms, and then bent round a centre—care being taken that no part should hold water. With the Renaissance style the *girouette* partook of the universal pride and bearing. Fable, Allegory, Mythology, social life, and religion were all pressed into the service, and furnished subjects. There is a terra cotta specimen of this date given in Caumont's *Abécédair*, in which a pelican forms the principal feature. Another representing a bird roosting may be noticed in a *girouette* at Chalons-sur-Marne; you will remark the difference of treatment between the fourteenth and sixteenth century birds—the earlier example being wonderfully abstemious in ornament, and the terminal quite flat to serve as a vane, the other overcharged with foliage and masks of which latter there are no less than thirty-two, and useless as a weather-cock. I often wonder that birds are not more frequently introduced as terminal ornaments to gables. I have seen pigeons perch themselves on the verge of a belted gable, conscious that they were the right thing for the place, and I have always acquiesced in their opinion. M. Boust, the French architect, with whom I have the honour to be acquainted, has used a similar *girouette* to a dove-house, near Levarot. The Hôtel Dieu, at Beaune, contains some very fine specimens of the *girouette*; you will find some illustrations of them given in Mr. Clutton's work. He says the effect of the *epi* would be valueless if it were not backed by the high-pitched roof of the main building. I don't quite agree with him there; were a background always necessary for these ornaments lofty crestings would at once be inadmissible, and the finial, which so invariably terminates the cone of the apse, would be the greatest offender of all.

Another method of treating lead work, which I shall do little more than allude to, is the surface decoration of sheet lead, either with gold or paint, or by the process of toning described by Mr. Burges. In the first place, I do not quite understand the description of the process; and, in the second place, I look upon this art as supplemental only to the proper understanding of plumbers' work, which at present is confined to the most unenlightened class of mechanics. To some extent, indeed, there seems to be a rational argument for its adoption, as may be inferred from the following remarks taken from De la Quernie.

The lead work of the pinnacles of Notre Dame de Chalons-sur-Marne still exhibits traces of ornament and a figure of St. Sebastian, which are not bossed out as some persons believe, but which have been painted and gilt, though time has caused all the gilding to disappear, where the metal has not been covered from the air by gilding or paint, the thickness has been diminished by oxidation. Mr. Clutton says:—The roof of the palace at Blois is covered with auger slates, and the lead flashings upon the ridges of the main roofs, and those of the dormer windows, were historiated with the arms of France and Brittany, and with the badges of the Cordeliers and porcupine. The drawing found in the archives of St. Vincent, at Rouen, is interesting, as showing the way in which this method of enrichment was intended to be carried out on a crested ridge.

One of the most remarkable properties of lead is its fusibility; and we might, therefore, naturally expect to find some indications of this fact having been taken advantage of by our Mediæval artists; and yet, with few exceptions, this is not the case; it is a little curious that the few exceptions apply principally to fonts

* Paper read before the Architectural Association, by Mr. T. W. GOODMAN, on 25th April.

INTERIOR OF THE CHURCH OF ST. JAMES THE LESS, WESTMINSTER.—MR. G. E. STREET, ARCHITECT.

and coffins—whether there is anything symbolical in this connection with the two terminal of life is not evident. The Glossary gives an account of lead fonts to be found at Brookland, Dorchester, Warborough, Warcham, Walsford, Churton, Childrey, Clewer, Long Willenham, &c. The stone font at Ashover, in Derbyshire, is ornamented with leaden figures of the Apostles. Examples are likewise to be seen on the continent, as at Bourg Achard, and the leaden font in the Museum at Rouen. I once made a drawing of a font in Shelden Church, near Birmingham, the exterior of which, as well as the interior, is lined with lead, carefully bossed round the tracery—a painful instance of perverted ingenuity.

Among the most remarkable coffins are those found under the effigies of knights in the Temple Church.

Lead has been used for purposes of sepulture from a very early age; the older and more usual custom being to use sheet-lead and work it up into the form desired. It appears that the Romans seldom or never used solder in the construction of their coffins; for what reason I cannot say. I found a description of a Roman coffin in the "Archæologia," I think, discovered at Newport, in Monmouthshire. The stone coffin lay in a trench, well packed on either side with charcoal; the inside was lined with lead, and iron bars supported the lead cover; the lead remained entire, but the iron had disappeared. But, to return to the subject of cast lead; what are the objections to its use? First, the difficulty of securing and maintaining good edges and true planes; then its expense; then its weight; and, lastly, the objection that applies to all cast work—the substitution of a mechanical process for a work of art to geometrical forms, such as the suns and stars on the *girouettes* or roof timbers. The objection does not apply, and I should only be too glad to see a few more of them introduced.

The use of lead for eaves, gutters, and down-pipes is fast going out of date, but I do not see why we should not specify ornamental heads to be made in this material, especially in small works. That down pipes may be treated artistically, whether in lead or cast iron, no one can doubt. The new school in Endell-street, and the bank in Blackfriars-bridge-road, have each some points of originality to commend them.

Having thus come round again to a more utilitarian aspect of the subject, I will briefly refer to the important question of lead pipes and cisterns, and their liabilities to impregnate the water which passes through them with noxious matter. You may remember that a lead pipe at Tunbridge, a quarter of a mile in length, used for the conveyance of water, had to be taken up and iron substituted. In this case the water was exceedingly pure, and the impregnation was attributed to the solvent powers of carbonic acid gas.

Ammonia exists in the purest water, so that purity alone is no guarantee for its safe transit through leaden pipes, but rather the reverse, as we shall find. Neutral salts are beneficial, because they retard the corrosive action by forming an impermeable deposit. The purest water that we can obtain is by distillation, and yet it has been noticed that the leaden lids of cisterns, on the under side of which distilled drops of water accumulate, are liable to rapid corrosion and final destruction, while the leaden cisterns themselves do not suffer. This must arise principally from the action of ammonia in the distilled water.

Great care should be taken that no decayed animal or vegetable matter is suffered to accumulate at the bottom of lead cisterns, as it may decompose the salts of lead and dissolve the coating by acetous fermentation.

Christien, in his treatise on Medical Jurisprudence, suggests that rain or snow water for culinary purposes should not be collected from leaden roofs, nor preserved nor conveyed in lead, and that the same rule applies to springs of unusual purity, where the saline impregnation is so small that it does not exceed $\frac{1}{10000}$ part of the water. That spring water which contains $\frac{1}{10000}$ part may be safely conveyed if the salts be sulphates. That lead pipes cannot safely be used where the water contains $\frac{1}{3000}$ part if the salts be muriates. That spring water, even though it contains a large portion of salts, should not be kept a long time in contact with lead, and that cisterns should not be covered with lids of this metal. I may mention, by the way, that the plan is sometimes adopted of giving lead cisterns a thin coat of Roman cement; it steadily adheres, is perfectly insoluble, and forms artificially what neutral salts do chemically—an impermeable deposit.

The last branch of ornamental lead work, perhaps the most familiar to us all, as it combines the ornamental and useful, is the plan of glazing in patterns. To me there are few records of antiquity more interesting than the apparently frail relics whose spider-like rays are hung to catch the first beams of the rising sun, and so impress them into the service of the church, whether by saintly legend or Bible song. And yet, though so frail—for what is weaker than lead, or more easily fractured than glass—there are abundant remains for us to study, and, if imitation is anywhere pardonable, for us to copy. The most interesting specimens I have met with are at Mantes Beauvois, St. Etienne, at Caen, Chalons-sur-Marne, Louviers and Bayeux. There are comparatively few in Italy, but I may call your attention to one at St. Fortunato Todi. I need not use illustrations to this part of my subject, for I suppose most of those I have mentioned are published in some shape or other. Take, for example, that splendid work of Cahen and Martin, "Monographie de Bourges," and you will see what wonderful examples of thoughtful and patient design we have in this one branch of ornamental lead work.

In bringing these few remarks to a conclusion, I must express my regret that I have not been able to give practical illustration to my remarks by actual examples; we have seen in two recent papers how much may be rendered intelligible by reference to models and specimens, and I am sure that we can adopt no better plan, if called on to design any ornament in which foliated outlines are introduced, than to practise on a piece of thin sheet lead, and model it for ourselves. Perhaps, in time, we may even rival Mr. Skidmore's golden-plated acanthus.

THE GUESTEN HALL, WORCESTER.—The Dean and Chapter of Worcester have presented the sum of £100, and the roof, or what remains of it that is sound, of the old Guesten Hall, which is now in process of being pulled down, towards the erection of the new district church which it is proposed to build in the parish of St. Martin's, near the railway station, under the direction of Mr. W. J. Hopkins.

A plan is on foot to erect a fountain, from a design by Mr. G. G. Scott, in St. Giles's, Oxford, as a memorial to the Prince Consort.—Bradford proposes that its memorial should consist of an Institution for the promotion of art and science, under the title of Albert Institution. It is hoped to raise £10,000 for this purpose.

ARCHITECTURAL ASSOCIATION.

An ordinary general meeting of this Association was held on Friday evening; Mr. THOMAS BLASHILL, the Vice-President, in the chair.

Mr. C. J. ADAMS, hon. sec., read the minutes of proceedings at the last meeting, which were confirmed.

Nominations.—The following gentlemen were nominated for membership, and will be balloted for at the next meeting:—Mr. John Eastby Goodchild, 22, Remington-street, City-road (proposed by Mr. A. W. Blomfield, and seconded by Mr. T. Roger Smith); Mr. H. J. Shepherd, 5, Prince-street, Chelsea (proposed by Mr. Arthur Smith, and seconded by Mr. C. J. Adams); Mr. George Patrick, 18, Gloucester-villas, Loughborough-road, Brixton (proposed by Mr. F. Sills, and seconded by Mr. Taylor); Mr. T. Barker, 29, Offord-road, Barnsbury-park (proposed by Mr. Winbridge, and seconded by Mr. C. J. Adams); Mr. John R. Gover, 7, Sydney-terrace, Portland-place, Clapham-road (proposed by Mr. G. R. Green, and seconded by Mr. T. M. Davies).

Opening of the Library.—The CHAIRMAN announced that the library was now open, and that books could be obtained by members on application to the curators.

Lead Work.—Mr. T. W. GOODMAN read a paper on Lead Work, which will be found on another page.

The CHAIRMAN said they had had a most interesting lecture from Mr. Goodman, and it did not at all, in his opinion, clash with Mr. Skidmore's lecture, which referred chiefly to gold as a metal. Those who had been out of England for how-ever short a time, must have been struck with the amount of lead work to be found in France, Germany, and Italy, as compared with the small quantity in this country. He was sure the lead cresting looked a great deal better than any lighter cresting; at Notre Dame, at Paris, there was an immense cresting of that kind, some 3 or 4 feet in height. Such things were very common on the continent, and remembering the ease with which lead could be cut and beaten out, and the great applicability of lead for ornamental work it seemed strange it had not been more used for decorative purposes. As to the question of pure water being damaged in lead cisterns, that appeared to him a very simple thing, and easily explained. If water was pure it had a tendency to attract impurities from any material through which it might run, thus making itself impure. The purer the water the stronger the tendency it had to take hold of the impure matters in lead, and lead cisterns were very apt to get out of order. Lead could easily be cut into shapes, and it seemed especially desirable to have ornamental lead crestings.

Mr. GOODMAN was of opinion that iron work would supersede lead work to a considerable extent.

After a brief conversation of a desultory character, a vote of thanks to Mr. Goodman was carried by acclamation, and the meeting separated.

RECLAIMING LAND FROM THE SEA.

IN a paper read recently before the Liverpool Polytechnic Society, by Mr. T. ANNOTT, President, the author said this subject has occupied far too little attention in an old and thickly peopled country like ours, where the value of land has outrun that of nearly everything else; fettered, too, as it too often is, with leases and other tenures which reduce it to a mere loan from the superior after all. And this taken in connection with the extension of railways along our seaboard, as the means of making much land now overflowed available for culture or pasture for cattle, attracted my attention to the matter as one worthy of some consideration and notice. In the Netherlands we see thrift and plenty, and no people more respect the dignity of labour than the Dutch; their cities, too, are well built, neat and clean, and the people patterns of intelligence, industry, and moral worth; Brougham has said, in proof of their industry, that they inhabit a sandbank reclaimed from old Ocean. And certainly the lowest part of the immense alluvial tract of Western Europe lies between the mouths of the Scheldt and the Ems: while it is matter of history that much of our own eastern counties have been submerged. Off the Rhine and the Meuse the remains of forests are covered by the German Ocean, and paved roads, villages, and the traces of former tillage lie buried in the neighbouring morasses, and dykes and embankments hem in the land all around. The hydraulic works of canals, &c., are said to have cost Holland £300,000,000, and the Waterstaat, or Board of Marine Engineers, has been maintained for centuries by that Government. The ocean dykes are 30 feet high by 70 feet base, faced landward with wood and stone, and seaward with mats of rushes and flags staked to high water mark. Amsterdam is built on piles, and so intersected by canals as to form ninety islands, requiring 280 stone and wooden bridges, one of them 600 feet long. The Polders are tracts of country lying under the water level of the adjacent country, and exceed 1,000 in Mid-Holland, some 20 feet under the sea level, and in Rhineland, while there are only 76,000 acres of reclaimed, there are 173,000 acres of polder land, and 56,000 still redeemable. Four plans are adopted of reclaiming polders: first, by gaining it from the sea by engineering skill; second, by ground gained from the rivers by circumscribing and diverting and deepening their currents; third, by draining off lakes; fourth, by digging turf for fuel in such quantities as to make extensive depressions, and draining it—all requiring an extensive system of drainage, sluices, ditches, canals, and embankments, with extraordinary mechanical agencies to elevate the water above the surface of the contiguous rivers, &c. Haarlem Meer was formerly an inlet of the Zuyder Zee, 33 miles in circumference, and 13 feet below the lowest tides, and, owing to the soft alluvial of the surrounding country, it had more than once threatened damage both to Amsterdam and Leyden. In 1839 a dyke and canal were built around the entire area to intercept drainage from the higher level, to provide navigation in lieu of the lake, and to form a channel of outlet for the water pumped out. The canal is 40 miles long, 9 feet deep, and widening from 125 feet to 148 feet. Three main sluices were placed at Katwyke, Halfge, and Spaarndam, the first and second merely self-closing floodgates; but at Spaarndam a propelling engine was used, and the lake was closed in 1848, when three engines were erected on piles driven down 40 feet. What was formerly a waste expanse of water is now exceedingly fertile land, in fine cultivation, enlivened by farms, villages, and a thriving population, and in proportion to the other inhabitants of Holland, this old bed of the lake is capable of sustaining 50,000 people in comfort. That thoroughly-practical and energetic people, the Americans, much in the spirit of the early Dutch settlers there, in addition to the many hundreds of miles of embankments along their alluvial rivers to save the land, and connecting so many of their vast rivers by canals, have also gained

on the seaboard, as exemplified by the frontage of new streets at New York, Boston, San Francisco, and elsewhere. But no land promises better opportunities and returns than our own for works of this nature, for the Swash alone, off Norfolk, occupies twice the space of Haarlem, and is very shallow. There is also Morecambe Bay, the mouth of the Dee, and many other points worth millions, along the sea walls of which railways might be carried, and thus pay for themselves. And in Ireland there is Loch Neagh, ten times the extent of Dublin Bay—fifteen miles by seven—and not far from the coast, and considerably above the tide water; and the same remark applies to nearly all the lakes in the north-west of that island. Indeed, 467,000 acres are covered by water there, and 6,000,000 acres still unoccupied bogs and mountain land, to the reclamation of which public money could not be better or more profitably turned in times of a famine of food or labour.

The works of Vauban and other French engineers show how much attention has been directed to sea walls and embankments in that country, and at the mouth of the Seine and elsewhere along their exposed coast the trumpet-mouthed and wave-line harbour entrances are so well adapted that I have seen a large transatlantic steamer come into Havre nearly at full speed, through a heavy and dangerous outside swell, and pass into the docks; and the plan of having open spaces, with piles driven at a great incline, serves well to spend the force of the waves and save the masonry. I would suggest that funnel-shaped embankments are best adapted in entering from an open seaboard, and to leave ample room inside for water storage, which can alone keep open any port, and is, no doubt, the source of the advantage we have in the scouring out of the channels of the Mersey; and if we ever allow a silt up in the estuary higher up, it will affect the channel outside.

CHURCH OF ST. JAMES THE LESS, UPPER GARDEN STREET, WESTMINSTER.

THE admirers of Mr. George E. Street have at length the satisfaction of seeing the metropolis adorned with one of his original and beautiful works. Hitherto, we have had to rest content with looking upon representations of them upon the walls of the Royal Academy and Architectural Exhibitions, or have been obliged to take a journey—well rewarded, we admit—away from London to look upon the churches themselves. We know not the cause of this apparent neglect of one of the ablest of our church architects. Wherever we light upon his skillful drawings or examine his buildings, we immediately recognise the individuality which he stamps upon them. He is one of the few who have studied Medieval architecture with real and marked advantage—not to give us simply a reproduction, but a further development of it. He is not satisfied with making a collection of fragments and fitting them harmoniously together, but he makes what in less able hands are hard, rigid features as pliable as clay in the hands of a potter. It is the freshness and life breathed into everything he touches, which, spite of faults, makes his buildings so interesting. We cannot read them at a glance, because they are not made from familiar stereotyped plates; but we can with pleasure walk round, examining carefully every bit of detail, and, regarding them from every point of view, find with each step ever varying enjoyment.

Through the liberality, mainly, of the Misses Monk, daughters of the late Bishop of Gloucester, the new church of St. James the Less has been built, and Mr. G. E. Street was employed to design it. It has now been some few months consecrated and opened for service. We gave, at page 663 of our last volume, a detailed description of the building and its decorations. The interior is of red brick. The columns are granite, with free-stone caps and bases. The font is of alabaster. The pulpit is somewhat over-charged with carving. On either side of the altar are figures let into the stone in a sort of niello. They represent typical women of the Old and New Testaments. The ceiling is elaborately and rather too strongly painted. In the arch over the credence table there is a fine piece of sculpture in low relief, representing, grouped vine-leaves and corn-stalks. We must, however, refer to our former description for other details. We shall be glad if our view causes our readers to visit the church and give it that study which its beauties deserve.

The exterior, unfortunately, is so hemmed in by houses that from no one point can it be seen in its entirety. The tower springs boldly up from the ground, and is connected with the church by an arcade porch. It stands like a stern sentinel, proud of its position, beside the building, and reminds us in this respect, as well as in some portions of its detail, of the finest of the Lombard towers. It is a pity that funds cannot be had to buy the adjoining houses, so as to effect a thorough clearance round this noble edifice. Meanwhile, we would suggest to all visitors to seek out a narrow court which leads to the chancel end of the church, and enjoy thence the best view which can now be obtained of the building. The full extent of the church cannot be seen from it; but the tower, as there seen, groups very picturesquely with the apse and transept, and gives a good idea of what the church would appear if disencumbered from its belt of ugly houses. The contract has been most satisfactorily carried out by Mr. Myers.

PRESERVATION OF HAMPSTEAD HEATH.—A public meeting having been convened for the purpose of taking such steps as might be deemed most expedient for preserving Hampstead-heath from building operations, a lengthened discussion, in which Mr. Clowser, Mr. Worth, and other gentlemen took part, occurred, and Mr. Gurney Hoare said he was quite willing that some concession should be made to Sir Thomas Wilson, if he (Sir Thomas) would in his turn give a written assurance that he would not build on the heath. Ultimately a resolution to the effect that if Sir Thomas Wilson should apply to Parliament for an Act enabling him to build on that portion of his estate which adjoined Finchley-road, the meeting would not oppose such application provided he gave a written promise that he would not encroach on the heath, was put and carried.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

ON Monday last an ordinary general meeting of this body was held; Mr. WILLIAM TITE, M.P., F.R.S., the President, in the chair.

Mr. T. HAYTER LEWIS, hon. secretary, read the minutes of the previous meeting, which were found correct and confirmed.

Donations.—Mr. JAMES BELL, hon. secretary, announced several donations, amongst others, statistics respecting the colony of Victoria, including official reports on architectural and engineering matters, accompanied by an elaborate plan of the mining districts and several other plans relating to the colony. A vote of thanks to the donors was passed.

Presentation of Prizes.—The CHAIRMAN said, part of the business of that evening was of a very gratifying character, because they had the opportunity on the present occasion of presenting the medals and other prizes disposed of by the Institute, for the encouragement of those who had paid attention to the art in which, and about which, they were all of them most interested. The first and the most important thing was, naturally, the presentation of the Royal gold medal—(hear, hear)—and he was sure he might say they were all much gratified in being able to record that it had been the good fortune of the Institute to have the opportunity of presenting a memorial so valuable in itself, and so interesting in all its connection with architecture during now a very considerable period, to so distinguished a gentleman as Professor Willis—(Hear, hear). They were all aware her gracious Majesty had been the patroness of this Institution almost from the very commencement of her reign; but it was not until the year 1848 she was so kind as to place at their disposal, annually, this very elegant and valuable testimony of her approbation. In 1848 the first Royal gold medal was placed at their disposal, and he thought the list which followed showed they had not been unmindful of her Majesty's gracious kindness. The first name on the list of honour was that of Professor Cockerell, to whom the Royal gold medal was presented as a testimonial of their respect and esteem, and of admiration of his great talents and merits as an architect. The Council very wisely resolved, with the gracious permission of her Majesty, to present the Royal gold medal each alternate year to a foreigner eminent in his profession, the medal being thus thrown open as a reward to English or foreign architects who had distinguished themselves in their profession, to distinguished writers on architecture, or to men of science relating to architecture of any country, who might have designed a work of high merit. Therein he thought the Council acted very wisely; and, immediately availing themselves of the gracious permission of her Majesty, and after honouring the most eminent architect Professor Cockerell, they presented the Royal gold medal to Chevalier Casina, whose genius all English architects would well remember, as well as the incidents which terminated his life before he returned to Rome. He needed not to go further into the list of the eminent men who had received the Royal gold medal from the Institute, but proceed at once to the immediate business of the evening. Having acknowledged on various occasions the efforts of men of science and genius, English and foreign, the Institute had in the present instance, with the gracious permission of her Majesty, awarded the Royal gold medal to the Rev. R. Willis, Jacksonian Professor, Cambridge—(Applause). Now, he felt it to be a matter of very considerable difficulty and delicacy to speak much about a man in his presence—it was a proceeding not very English in its character, not very much in unison with the character and habits of the English people to praise one another—yet he must observe he might be pardoned for saying a few words of praise of their kind and excellent friend Professor Willis, who was not a professional architect; and not because he had produced a work tending to promote the art of architecture, or the various branches of science connected therewith, but because he had produced many such works—(Applause). He was looking, a few days ago, at some of the works of Professor Willis, and held in his hand a book which, as far as he knew, was the first work by Mr. Willis on architecture. It was dated 1835, and was a work on the middle ages, particularly on Italy; and that work, though so long published, had lost none of its interest at the present day. Much that that work contained had led to further inquiry, and had been of the very greatest possible interest, importance, and value to architects. He found in this book a text-book, teaching the very earliest suggestion on Italian Gothic architecture. Well, then they found their friend Mr. Willis came before them with a strong claim that followed almost immediately afterwards, in following Professor Baily, and being appointed Jacksonian Professor, at Cambridge, of experimental philosophy—a chair which the sister University of Oxford had not; and the University of Cambridge was fortunate in having instituted such a professorship and in having appointed such a professor—(Applause). Then Mr. Willis had never selfishly clung to one particular view of architecture, and in one of his papers he found he gave an essay on the difference between the entablatures of Egyptian and Grecian architecture. Then his elaborate essays on cathedrals, especially Canterbury, had always been of much service, and he had done a great deal in the way of showing them how observations should be made on such matters. At last came the honourable testimonial which he had the pleasure of presenting Mr. Willis with—the gold medal of the Queen. He was sure they were all much indebted to Mr. Willis for his papers and contributions, in his encouragement of the art and science of architecture. His teaching had been as useful in mechanical appliances and mechanical science as it had been found valuable in reference to all that was useful, as well as elegant and ornamental, in architecture. No medal was more honourably deserved, and no medal was ever more worthily bestowed, than that which it was now his pleasure to hand to Professor Willis—(Applause). (The Chairman then presented the gold medal to Mr. Willis amidst loud applause.) He hoped that health and strength would be given to him so that he might be enabled to continue his most useful, most honourable, and most valuable labours—(Applause).

Professor WILLIS, in returning thanks, said he found himself very much in the same difficulty as that to which his friend in the chair had alluded in a kind speech, in which he had greatly exaggerated any claims he might have; but he could hardly thank them for the great honour which had been conferred upon him that night, without saying something of himself. The honour conferred upon him that evening was one of the great honours he had happened to receive in the course of his life, and the testimonial which he had received from the Institute, conveyed in such flattering words from the Chairman, he should never forget. In reference to the works which he had ventured to publish from time to time, he would only mention one, which would be still dearer to him than it was ever before; it was one which might have contributed to the reputation Mr. Tite had assigned to him, and he should always look at it with pleasure, because it was published by the Royal Institute of British Architects—the work he

referred to was an "Essay on the Vaults of the Middle Ages." He assured the members of the Institute he should never forget the honour they had bestowed upon him, or the kind way in which the President had spoken of him—(Applause).

The CHAIRMAN said the next reward he had the pleasure of presenting was the Institute silver medal, with five guineas, to Mr. F. R. Wilson, for illustrations and a description of the Church of St. Peter and St. Paul, Breckburn Priory, Northumberland.

Mr. WILSON briefly acknowledged the compliment.

The CHAIRMAN next presented a prize in books of the value of five guineas, instead of the Soane medallion, to Mr. C. H. M. Milham, for a design for a museum of sculpture and painting.

The CHAIRMAN then presented Mr. Cockerell's prize of ten guineas to Mr. A. W. Davies, for a design for a small market-house and room above.

The CHAIRMAN presented the next prize (an Institute one in books) to Mr. R. P. Spiers, for a design for a villa.

The CHAIRMAN said the next prize was one of ten guineas, which he had offered for the best study in something Classical, because, though a great lover of Gothic architecture, he was wishful that Classic should not be forgotten. The prize was awarded to Mr. H. S. Legg, for designs for a small town-hall and a railway station.

The CHAIRMAN said the next prize he had to present was what was known as the student's prize (in books), and they were always very anxious to encourage students in everything that was good. The prize was awarded to Mr. R. H. Carpenter, for a design for a dispensary, suited for a manufacturing town.

The CHAIRMAN then presented Mr. S. Fry, student, with a prize in books, for the best series of monthly sketches.

The CHAIRMAN, on the part of the Council, urged on their young friends who had received prizes to exert themselves still further. The prizes were not in themselves of so much value, but as being calculated to call forth application, industry, and taste, they were of great importance.

The Architecture of Palestine.—The Rev. GEORGE WILLIAMS, B.D., then read a paper by Signior Pierotti, architect to the Pasha of Jerusalem, "On Jewish and Roman Architecture in Palestine, from the earliest period to the time of the Crusades." Signior Pierotti was present, and pointed out on various plans and drawings places referred to in his paper, which will be found reported in another portion of this issue.

Mr. J. FERGUSSON, having been called upon by the Chairman, said he really did not know that the paper which had been read called for any remarks from him. What Signior Pierotti had given them that evening was not new. It was not an account of his discoveries, but an account of a variety of buildings existing in Palestine which they knew of before. He had expressed nothing new, and, therefore, it was not necessary he (Mr. Fergusson) should refer to the subject. If Signior Pierotti had confined himself to his own researches and discoveries, as he did at the Architectural Museum, it would have been well worth while to discuss the matter thoroughly, because that gentleman had, with great industry and intelligence, and with great success, explored the underground watercourses and other matters of interest; but all the points he had brought forward that evening were not new, but well known. As to the Golden Gateway, Signior Pierotti said it was not a building of Herod or of Justinian; if it was meant to be said it was a building of Constantine, they all knew that Constantine did not build the temple, or a part of the temple. He did not quite agree with what Signior Pierotti advanced about the Holy Sepulchre; and as to what were called Pools of Solomon, he should like to know why they were called so, for they were not mentioned in the Bible or in Josephus. Signior Pierotti had not brought forward any building they did not know before, nor had he brought forward any new idea on the subject of the buildings in Palestine, and though a book on such a subject would be valuable, he did not know that he had anything to say on the subject of the lecture. He thought, however, they were all indebted to Signior Pierotti, who, for eight years, had surveyed and brought to light the architecture and archaeology of Jerusalem; in that way he had done great service, and he (Mr. Fergusson) should hail with pleasure the publication of his work. He proposed a vote of thanks to Signior Pierotti for his valuable labours in Jerusalem, the results of which, he hoped, he would very soon give to the world in the work he proposed to publish.

The Rev. GEORGE WILLIAMS seconded the vote of thanks. The only share he had in the business of the evening was simply reading a translation of the paper by Signior Pierotti; but he was surprised to hear Mr. Fergusson say there was nothing new in the paper, for the description of the Pools of Solomon, and other objects, were new; objects, which he (Mr. Williams) never saw when he was in Palestine. And it was a great merit of Signior Pierotti that he had given them something positive to go upon, for formerly they groped in the dark. Now that Signior Pierotti had sited the dust they were in a better position, and the publication of his work would, he (Mr. Williams) thought, lead to important results. He quite felt himself that they did not at all yet know the value of the discoveries of Signior Pierotti nor seen their way to the inductions from the discoveries he had made, and they would, he was sure, all apply themselves to his book when it was published. It was certainly satisfactory thus far that Mr. Fergusson had been confirmed in his previous views on the subject of Jerusalem, and so had his (Mr. Williams's) been confirmed, but he certainly hoped that would not be the most satisfactory result of Signior Pierotti's discoveries, and that they might arrive at some satisfactory conclusions in which the members of the Institute would be able to acquiesce.

The CHAIRMAN said he never saw any collection half so complete of the ruins of Jerusalem as that which that evening adorned the walls of the Institute. He proceeded to say that he recollected Barry, very particularly on his return from Syria, remarking on the character of the masonry there, that was, the courses of stone being set one on the other in the Jewish masonry; but that was not peculiar to Jewish masonry, as he had seen it in Perugia. In the great minuteness of the illustrations much of value was to be found, and when the promised work was complete they might furnish suggestions for a better acquaintance with the most interesting country referred to.

Mr. WIGLEY was happy to say that Signior Pierotti had given, in a practical way, a notion of its architecture worthy of the Holy Land—a country where the most important events had taken place—and it certainly was a most important country at the time of the Jews and Romans. In his opinion there was much novelty brought forward in various portions of the paper of Signior Pierotti; but he thought the lecturer made mistakes in his remarks about the times and dates of masonry, whereas they referred, according to his idea, to different positions

of the building. As to the Golden Gate, Mr. Fergusson said Signior Pierotti stated it was not Herodian nor of the Justinian period; but he (Mr. Wigley) thought Signior Pierotti said at Brompton it was Justinian. He (Mr. Wigley) thought, however, that they had here a complete piece of work of the time of Herod the Great. In Justinian's time there could be no reason for such a gate being constructed on the spot where it was. As to the Southern Gate, which was not alluded to in the lecture, it seemed to be of the same period as the Golden Gate.

Professor DONALDSON said, having observed remains of antiquity in various parts of the Roman empire, his opinion was, that the Golden Gateway did not date from any remote time, or from a refined period of Rome. Even at the time of the Antonines they did not find architecture so degraded as in the details of the Golden Gateway before them. They had proof of that both at Balbec and Pdimyra, so that the Golden Gateway must have been of a much later period than that assigned to it. He proceeded to say that he felt convinced that it would be difficult to bring before them satisfactory historical and architectural evidence of the peculiar construction of a chamber, by looking, as the lecturer had done, down a hole. When he (Professor Donaldson) visited the tombs of the Egyptians, with the glimmer of the lights it was difficult for him to discover the construction of the tombs. Therefore, it would be difficult, by looking through a hole of small diameter, to tell what was the peculiar construction of a chamber. Signior Pierotti alluded to a parallel architecture in Greece to what he found in the East; but he (Mr. Donaldson) did not find the parallel, and he saw a much more recent construction, both in the forms of the stones and the modes in which they were put together, than Signior Pierotti would lead them to believe these monuments were of. At the same time, he begged to award to Signior Pierotti the due meed of praise for bringing before them all he could ascertain, but still to warn him against being too easily led away.

The vote of thanks to Signior Pierotti was carried by acclamation, and the meeting separated.

THAMES EMBANKMENT.

THE following is a copy of Mr. McLean's report to the First Commissioner of Works, of the estimated expenditure to carry into effect the provisions of the Thames Embankment Bill; distinguishing the cost of the approaches to the embankment, and of the street between the embankment and the Mansion-house, including compensation and all other expenses; also the estimated cost of the Low-level sewer, and the length of the embankment and of each street.

Estimated expenditure to carry into effect the provisions of the Thames Embankment Bill, including compensation and all other expenses.....	£ 1,500,000
Estimated cost of the approaches to the embankment.....	80,000
Estimated cost of the streets between the embankment and the Mansion-house, including compensation and all other expenses.....	500,000
The length of embankment between Westminster-bridge and Blackfriars-bridge.....	Yards. 2,235
Length of street from embankment to Mansion-house.....	1,007
Length of approaches to embankment:—	
From Whitehall.....	230
From Whitehall-place.....	321
From Villiers-street.....	105
From Buckingham-street.....	79
From Cecil-street.....	22
From Wellington-street.....	524
From Surrey-street.....	14
From Norfolk-street.....	208
From Arundel-street.....	26

Mr. Bazalgette states that it is not possible to give a close estimate for the cost of constructing the Low-level sewer within the embankment on the north side of the Thames without definite plans from which to estimate, but it may be approximately stated at £30,000, including the branch connections, but exclusive of the preparation of the foundations, cofferdams, and incidental works, which would be debited to the embankment.

THE POLYTECHNIC INSTITUTION.

THE directors have introduced several novelties to attract holiday folk to this Institution. Professor J. H. Pepper is lecturing "On Colour in General, and Coal Tar Colours in Particular." After alluding to tar, and tracing up from this disagreeable fluid the production of benzole, aniline, mauve, and magenta, the lecturer proceeds to show his audience some curious productions of colours; the experiments are shown with the assistance of the large voltaic battery and electric light. Stereoscopic views of "Paris as it is," shown by the new achromatic lenses, are by Mr. England. Then comes the lectures and *science* of Messrs. King and Matthews to fill up the interval before the display of a new dioramic series of dissolving views of London, in all its interesting epochs. These views are designed by Mr. Brown, and painted by Messrs. Childs and Hill. The Brouil family, and a musical and buffo entertainment by Mr. George Buckland.

PREVENTING INCRUSTATION OF STEAM BOILERS.—According to the *Mining Journal* Mr. Peter Taylor, Hulme, has patented an invention which consists in applying a pipe to the interior of a steam-boiler, which pipe is made with a longitudinal slot extending the entire length of the boiler, and communicating with an off-pipe, in which is a discharge valve capable of being opened and closed rapidly; the valve is of the usual mushroom shape, and in the boss, or on the spindle, is a diagonal tube, taking in a fixed stud; the groove is of such an inclination that by turning the spindle about one-half round the valve is opened sufficiently to discharge the sediment which enters the pipe through the slot above referred to. In some cases two or more slotted pipes are applied near the bottom of the boiler, and one or more are supported near the surface of the water in the boiler, to collect the scum; the pipes may be connected to the same blow-off valve, or each pipe may have its separate valve.

PUBLIC BUILDINGS.

MR. COCHRANE'S motion—that an address be presented to her Majesty, praying that she would be graciously pleased to issue a commission to inquire into the state of the public buildings erected by Parliamentary grants within the last twenty years, and also of the houses rented for the public service; and to inquire whether, by adopting more comprehensive plans of building, greater public convenience, greater economy and unity of design might not be attained—was brought before the House of Commons on Tuesday, and was lost by a majority of 67, there being 49 votes for, and 116 against, the motion.

The proposer said that the question of which he had given notice was one of great importance, and latterly questions connected with the improvements of the metropolis had attracted much attention. He rejoiced that he was able to introduce the subject without reflecting on the management or conduct of the First Commissioner of Works or that of his predecessors in office, every one of whom, he was sure, had done his best for the improvement of the metropolis. What he complained of was the viciousness of the system. Anxiety for a comprehensive plan of improvements, especially in this neighbourhood, dated as far back as 1782. Previously to that date the whole of the improvements of the metropolis were in the hands of the Crown. In 1782, however, so large a debt had been incurred with so little Parliamentary responsibility that an Act was passed to prevent the Sovereign from spending in improvements more than £5,000 a year without the sanction of Parliament, and a surveyor-general of work was appointed. Notwithstanding this Act of Parliament, very little amelioration in the system took place. In 1828 a most important committee was appointed on the subject, and the state of things developed by them was such that it was found necessary to change the whole construction of the system. In that year a change was made, and in 1831 the present Board of Works was constituted. In the whole of the evidence given before that committee the importance of having some comprehensive plan of improvement, instead of proceeding on the bit-by-bit system, was strongly urged on the committee. Mr. Wyatt expressed an opinion that nothing could be more extravagant or expensive than the existing mode of conducting public works. It was the intention of the Government to erect a Foreign-office close to Downing-street, and a site had been already purchased. As far back as 1839 a committee sat on this very question, and the evidence taken before it as to the condition of the Foreign-office was quite extraordinary. The witnesses said there was a great sinking in the centre of the Foreign-office, the party walls had sunk considerably in consequence of the unevenness of the floors. The architect stated that he had put bars under the floor, beams above, and other beams bolted through the front and back walls. It was further stated that on one occasion, while an animated discussion was proceeding between a Foreign Minister and an ambassador a portion of the ceiling fell on their heads. Such was the state of the Foreign-office twenty-three years ago, and not a single stone had been laid of a new Foreign-office. As to the Record-office, any person visiting it must be astonished at the state in which the records were kept. All the most valuable records of the country were heaped up in a number of small buildings crowded round the Record-office, and at any time a fire might destroy the greater portion of the most valuable records of the country. A State Paper-office was built about thirty years ago; in 1855 it was proposed to add a story to it, and now it was intended to pull that down. He believed that already the whole of the records in that building had been swept into those miserable hovels which clustered round the Record-office. Then take the Excise-office, the Inland Revenue-office, which had cost £100,000, but, notwithstanding this expense, the Inland Revenue Department occupied ninety rooms in Somerset House, and the building itself was deficient in accommodation. As to Buckingham Palace, Lord Russell, in 1827, pointed out the extraordinary and inconsistent mode of proceeding which had been adopted with regard to that building. First it cost £240,000; then were added the wings, then a front, then a ball-room; and the result was an expenditure of £1,200,000. The most glaring case of all was the War-office, of which a short time ago there could have been no less than seventeen different departments scattered over London. At present, including the War-office in Pall-mall and the Horse Guards, there must be ten or twelve. Sir Charles Barry had stated before a committee that the greatest public convenience must arise from the whole of the public buildings being together. Mr. Hunt likewise stated that the bit-by-bit mode of proceeding was most inexpedient, as the owners of property never failed to ask extraordinary prices for the sites. He also quoted the evidence of Sir Charles Trevelyan, who was in favour of the concentration of the public offices in Whitehall and the vicinity of the Houses of Parliament, and referred to Lord Llanover, who advocated the concentration in 1856. The Right Hon. Mr. Cowper, when examined before the committee of 1858, gave evidence showing the expense and inconvenience of the present mode of renting private houses as additional offices, and the committee reported in favour of the acquirement of the freehold of the adjacent property as the truest economy for the State. The committee of 1856 also reported in favour of buying up the whole property in the neighbourhood; and Mr. Hunt gave detailed estimates and calculations, showing that the property and land bounded by George-street, the Thames, the Park, and Richmond-terrace could be acquired for £1,000,000, and that the necessary buildings could be erected for a further £1,500,000. Half a million had been paid, or would be paid, for new Foreign offices. Was the House aware that for the hire of buildings for public offices, for the repairs upon them, and for the expenses of furnishing, we were paying £82,000 a year?—a sum which would actually pay the interest upon the £2,500,000. Since 1821, independently of the Houses of Parliament and the Royal palaces, we had spent £500,000 upon public buildings. He asked the House to sanction the appointment of a Royal commission to investigate these figures. He did not advocate any expensive plans; he did not wish to urge the House to any extravagance. On the contrary, he thought the probable result would be the production of a comprehensive plan which would afford unity, symmetry of design, and width of approaches—thus combining beauty with economy, and preventing a larger outlay. This was the proper time for maturing and carrying out such a scheme. It was proposed to spend £200,000 or £300,000 upon the Admiralty, and every sixpence of that money might much better be laid out to the improvement of this part of London. He simply wished the House to ascertain what buildings they wanted, and to adopt some plan. At present they were squandering the public money without any satisfactory result. His object in proposing a Royal commission was that it might decide what quantity of ground was required to concentrate the public offices; and then that an architect should be appointed to prepare an estimate for the buildings, which should be handsome, and in a superior style, but not unnecessarily expensive. The building should be competed for, and the Government should limit the

amount of cost. It was the duty of the Government to cultivate the public taste by the erection of handsome buildings. When other countries spent so many millions for that purpose, was it too much to ask this country to spend £2,500,000 for public improvements in this metropolis? Let the House consider how anxious continental nations were to adorn their capitals. Many hovels were collected in the neighbourhood of the Houses of Parliament, and it would be an economical arrangement, to say the least, to introduce improvements. We should be gainers by the change. It had been said that the question of embanking the Thames had been mooted for the last two hundred years, and that it was to the glory of the right hon. gentleman's redileship that he had commenced the work of embankment. Let the right hon. gentleman add another glory to his redileship by determining upon some plan for the erection of public offices which would be worthy of this country and an ornament to the metropolis.

In reply Mr. COWPER said he sympathised with the motive of the hon. gentleman who brought this subject before the House, and quite agreed with him in the desire to see this great metropolis embellished with handsome public buildings. The commission proposed would, however, if appointed, supersede the responsibility of the Executive Government in regard to such matters, and he was sure that the only security which the House had for due economy being observed was to fix a definite responsibility upon the Government. A commission—not looking upon the question in a financial aspect, as the Government would be obliged to do—would probably fix upon a comprehensive plan which would cost five or six millions to carry it out. This would produce a reaction in the House, and would divert it from attending to what was really useful and practical. The present moment also was inopportune for such an inquiry. The hon. gentleman spoke as if the Government had no comprehensive plan, whereas they were at this very moment engaged in carrying into effect a portion of a very comprehensive plan which had been under consideration for a great many years. The appointment of a commission would not hasten but rather retard the progress of the improvement. If everybody's project were to be discussed all advance would be checked for some time. But this was not the main ground on which he relied for asking the House to reject the motion. There was really nothing for the commission to inquire into that was worth the attention of a body so formally constituted. There was only one public building which had been erected by Parliamentary grants during the last twenty years—the Record-office in Chancery-lane—though several had been enlarged. He was happy to say that that building was in a very good condition, and there was very little to inquire into about it. The condition of the buildings rented for the public service was also very good. The other point on which it was proposed to direct an inquiry was, whether, by adopting a more comprehensive plan of building, greater public convenience, economy, and unity of design might not be attained. On this point he might observe that the present plan which the Government was in part carrying out was a comprehensive one, and had originated from the inquiries of twenty or thirty years. As early as 1832 plans were proposed for a grand building in Downing-street, and these plans were laid before a committee. In 1839 a committee on the subject made some very useful suggestions, namely, that the Foreign and Colonial offices, which then occupied private houses, should be rebuilt and form part of the general plan for the occupation of the whole unoccupied space between St. James's-park and the Thames. That recommendation was the foundation of the plan which was now being carried out. In 1854, Mr. Pennefather prepared a plan for that purpose. In 1855 a bill was introduced into Parliament. In 1856 there was a committee, and in the present year, 1862, the first stone was to be laid of a building which had been for so many years discussed. The scheme for a comprehensive building had been fully considered. In 1856 the Chief Commissioner of Works, now Lord Llanover, invited all the architects of the world to compete as to the best way of laying out the large plot of land between St. James's-park and the Thames. The first prize was awarded to a French architect, and that was the very plan upon which the Government was now proceeding. If the House of Commons should, on a future occasion, vote the requisite funds for the purpose, the plan, of which the buildings about to be erected formed a part, could be carried out as a harmonious whole. The Foreign-office would not stand alone. The ground on which it was to be erected was a quadrangle, and it was intended that each corner should be occupied, the whole space to include the India-office, the Colonial-office, and the Pay-office, as well as the Foreign-office. There would be plenty of room for all, for after the Foreign and India-offices had been erected there would still be 70,000 square feet of ground; and when the Law Courts were removed from Westminster Hall 30,000 feet more would be at the disposal of the public. This would give a total of 110,000 square feet. It seemed to be necessary, for the purposes of the navy, that the Admiralty should be removed from Somerset House to Whitehall, which would give additional room there; it consequently appeared to him to be an extravagant proposal to ask Parliament for any fresh land. Besides, there were already public works in contemplation and in progress in the metropolis that would occasion an outlay of probably over £4,000,000. The plans now acted upon were comprehensive, and it was in his own office considered essential that all new public buildings should be erected in contiguity with each other. The scheme of Sir Richard Bromley involved the taking down of all the present offices, many of which were in every way excellent ones, and the cost of carrying it out would be enormous. It was not at all likely to be acted upon. The course he proposed to take with regard to the Admiralty-office was simply to enlarge it. The allegation that the War-office now occupied eleven houses was correct, but they were all accessible to each other, and were convenient if not handsome, and no complaint had been made by the War-office authorities. As to the Record Office, it was as perfect a building as any one could desire, and the Master of the Rolls did not complain that the building was too full. Indeed, he had invited the sending to him of the State papers, for which room had been required. If additional room was necessary, the present building could be enlarged, for it was only a portion of the building intended to be erected, and when the Chancellor of the Exchequer should be prepared with the money it would be extended. Moreover, the Victoria Tower contained sixty-four fireproof rooms designed for records. As to its being an economical arrangement to erect new offices instead of retaining those now in use, he could not agree. The sum paid in rents was, in fact, £26,000; but only £11,000 of this was for offices occupied by Government departments, the rest being expended upon the National Portrait Gallery, the Museum of Geology, the Patriotic Fund, the Law Courts, and the War Department, which there was no necessity to concentrate in one locality. There were also the Seamen's Registry, the Stationery Office, and others, which could not advantageously be included in one building. On the ground of

mere economy, he maintained that the present system was the most preferable. The rent of the houses now occupied by the Foreign-office was £2,000 a year. Suppose the new building, with the ground, to be of the value of £300,000, and 5 per cent. was taken for the building and 4 per cent. for the site, that would give an annual value of £14,000. It was rather questionable, besides, whether it would be right to throw upon the present generation the whole charge of erecting these offices, which would do very well to be put up ten or even twenty years hence. The course which the Government proposed to take would, he believed, prove to be both advantageous and satisfactory, and that the buildings to be erected would prove worthy of a great city. He quite agreed in the opinion that it was desirable to have large and comprehensive plans, but thought it to be essential that they should be reasonable. He believed that the issuing of a commission would retard rather than facilitate matters, and not contribute to the desired result.

Lord J. MANNERS, however, was not disposed to treat this motion as one of economy on the one hand, or of expense on the other, but to regard it simply as a proposal for inquiry. He was at a loss to perceive how the right hon. gentleman could oppose the motion on the ground that it would affect the legitimate action of his own office. He said that a commission was unnecessary, because he was carrying out a large and comprehensive plan. That observation was alarming, and he (Lord J. Manners) should very much like to know what this great and comprehensive plan was, before they rejected the motion. The right hon. gentleman had also referred to the concentration of the law courts, and that was a delicate subject to speak about. He (Lord J. Manners) was under the impression that the House of Commons had rejected the scheme by which the money was to be found; but from what had been said, it appeared to be the opinion of the Government that the vote of the House of Commons meant nothing, and that the plan was to go forward. That was a very important fact to come out incidentally in a debate of this sort; but, whether the Government should disregard or set aside the vote of the House of Commons, there was no argument urged against the issuing of a commission of inquiry respecting the expediency of concentrating the public offices.

The CHANCELLOR of the EXCHEQUER said that he was one of those who had expressed great dissatisfaction in that House with respect to the history of the erection of important public buildings, the insufficiency of the modes of control, and the want of the securities of unity, expedition, and economy in those great undertakings. As he understood the motion, it was brought forward much more as an inarticulate expression of dissatisfaction than with reference to any definite form of remedy. As an expression of dissatisfaction he could sympathise with the motion, but he trusted the existence of dissatisfaction would not induce the House to adopt precipitately a motion of that kind without being satisfied themselves that they could find a remedy. As far as he was aware, the department of Public Works—he did not speak of it at the present moment in contrast with what it was in former times—was conducted with as much energy, ability, and discretion, under ordinary circumstances, as the other departments of the Government; but, at the same time, it must be admitted that it was subject to the faults that were incidental to the whole of the system. He thought the history of the erection of the Houses of Parliament was in some degree a special case. There were jealousies entertained, and evils which they could not trace to the root in the administration of any particular office. When they looked back to the history of public buildings for the last twenty years, they must see that their course had been unsatisfactory. Let them take, for example, the National Gallery. He thought the Parliamentary discussion of the question began with a committee; from a committee the question was referred to a commission; from a commission it was referred back to a committee; and then there was another commission. Not less than three or four different judgments were delivered on the site of the National Gallery. He confessed his belief that this question was entirely beyond the scope of any commission. He believed that by appointing a commission to deal with the matter they would be only tempting that commission to make vast recommendations, involving enormous public expenditure, with the almost certain issue of their recommendations remaining simply a dead letter. If the House had in view a particular question lying within certain bounds, such as the consolidation of the law courts, it might be wise to refer such a question to the consideration of a commission; but, in this case, the commission would be appointed, not to consider a definite scheme, but to consider, instead of the House of Commons and of the Government, upon what principle and by what methods a certain department of the State is to be conducted. The appointment of the commission would make a sinecure of the office of his right hon. friend (Mr. Cowper), who, until it had reported, might, if he could obtain leave of absence, travel abroad and improve his mind. The Government had made up their minds on this question, and were prepared to make certain proposals. The question of the law courts had made some progress in the opinions which had been elicited. Government would soon bring under the consideration of the House plans affecting two public buildings, and involving questions of great public interest; one would relate to the enlargement and arrangement of the Museum building of Kensington, and the other to the transfer of a large portion of the British Museum to that part of the town. Then there was the Foreign-office question, which he presumed had got out of the range of such a commission; but the question of the consolidation of the Admiralty, the National Gallery, and the disposal of the site of Burlington House, must remain in suspense for some years, for years it must be before a commission could report upon those entangled and complicated questions. The executive Government must take upon itself the management of this question, and submit its plans to the judgment of the House; and no doubt these questions would receive from the executive the consideration they deserved, and we should by degrees attain to a better system. It would be impossible for the commission to discharge satisfactorily the duties to be imposed upon it; and its appointment would interpose practical obstacles of a most serious nature to many practical plans of great consequence and importance, which were for the public convenience and advantage, and with respect to which the House of Commons would be called upon to give its judgment. On these grounds he hoped the House would not be disposed to agree to the motion.

The House then divided with the result before mentioned.

BATH.—The theatre at this place, erected in 1803, from a design by G. Dance, at a cost, it is said, of £25,000, was totally destroyed by fire on Good Friday.

ART-UNION OF LONDON.

THE annual general meeting of the subscribers to the Art Union was held on Tuesday last in the Adelphi Theatre, to receive the report of the Council, and for the distribution of prizes. The chair was taken by Lord MONTAGUE. The following is the report of the Council:—

The subscription of the Art-Union of London for the present year—the twenty-sixth of its establishment—"to promote the knowledge and love of the fine arts and their general advancement," amounts to the sum of £9,861 15s. The amount subscribed since its foundation is £289,028. But for the great commercial stagnation in many provincial towns, as asserted by our local honorary secretaries, the disturbance of our relationships with America, and some pressing claims on public sympathy, the subscriptions for the year would have been larger. The engraving distributed to all the subscribers, from Mr. F. Goodall's picture, "Raising the Maypole," has been received with very general favour, as well by the subscribers as by the public press of the country.

It will be remembered that the Council offered a premium of 100 guineas for the best series of designs in outline illustrative of "The Idylls of the King," and awarded it to a set by Mr. Priolo. These designs have been engraved by the artist, and, formed into a volume, will be presented to each subscriber of the ensuing year. Of these illustrations, six are appropriated to the patient loving "Enid," Enid, with the—

— meek blue eyes,

four to evil "Vivien" and witless Merlin; four to,—

— Elaine the fair, Elaine the lowly,—

— Elaine the lily maid of Astolat;

and two to sorrowing Guinevere. They give form to all the characters in the story of the "Blanchette King" Arthur and "his Table Round;"—a story through which the poet says to us in words the world will not willingly let die:—

— "O parblind race of miserable men,

How many among us at this very hour

Do forge a life-long trouble for ourselves;

By taking true for false, or false for true;

Here, thro' the feeble twilight of this world

Groping, how many, until we pass and reach

That other, where we see us as we are seen."

In addition to this volume of illustrations, every subscriber will receive, for each guinea paid, an engraving commenced by Mr. Shenton, and completed by Mr. C. H. Jeans, from the charming little picture by Mr. Dicksee, called "A Labour of Love."

Mr. E. Radclyffe has been commissioned to execute for the Association a volume of etchings from the works of the late David Cox, an artist whose drawings are most rightly estimated by those best qualified to judge of works of art. The etchings convey very satisfactorily the largeness, vigour, and other characteristics of the master. A certain number of the volumes will form part of the present distribution.

In accordance with a statement in their last report, the Council offered a certain number of premiums for drawings and models by pupils of the schools in connection with the Government Science and Art Department. The Council urged especially in their prospectus the importance of the study of the human and animal forms. Fifty works were submitted in response, and these were exhibited with the prizes of the year in the galleries of the Society of British Artists. Professor Donaldson, Professor Bell, Professor Westmacott, Mr. Troughton, and the hon. secs., were appointed a committee to examine them, and they reported with great regret that the expectations of the Council had not been realised, and that in too many instances the efforts were feeble. Some few, however, of the designs submitted, were very good, and the Council awarded £10 to Mr. M. R. Elden, of the Stoke School of Art, for a majolica plate, showing much boldness of conception and freedom of handling; £5 each to Mr. A. J. Elwes, of the School of Art, South Kensington, and Miss C. Phillott, of the Female School of Art, Queen-square, for drawings of animals from life; and £5 to Mr. Frederick Jenks, of the Birmingham School of Art, for a design for a dish. Mr. Elden's design for a majolica plate is being carried out by Messrs. Wedgwood. The result will form part of the distribution of a future year.

The gentlemen appointed to examine these works said in their report,—"Your committee having had in view the original purpose for which the Art Union was established, viz., 'to promote the knowledge and love of the fine arts, and their general advancement in the British empire, by a wide diffusion of the works of native artists, and to elevate art and encourage its professors by creating an increased demand for their works and an improved taste on the part of the public.'"

The Committee have called to mind the numerous efforts which the Council have made during a period of twenty-five years to fulfil its mission. In various departments of the fine arts their aim has been to create a love and taste for their study and production, uninfluenced by any personal motive, whether of rivalry, reputation, or profit. The attention of the Council has long been directed to one branch of their duties as specially worthy of consideration—namely, the application of the principles of high art to objects of common use or ornament in which all classes may take pleasure. The collections in the British Museum, not to speak of those of Naples, Rome, Paris, and Germany, show how intimately high art may be allied with the commonest purposes of life, and how intention, thought, and grace may be embodied, so as to give general pleasure and produce refinement.

There is no reason why our manufactures may not arrive at the same excellence, in an artistic point of view, as is shown in older works. Is not the whole sphere of nature as open to us as to the ancients, demanding to be studied with equally high aspirations and with clear comprehensions? Is our national history to be read in vain? Are our poets, our traditions, to be overlooked? Why should not these be brought into play, and made to keep alive in our minds an admiration and reverence for excellence and beauty, by being transferred to the art-productions of our manufacturers? This, however, is not to be effected by puny efforts, but by high aims, and by constant laborious study; by a careful avoidance of meretricious ornament, and a disregard of the praise of the ignorant, whose conceptions of excellence do not go beyond the most commonplace and inferior representations of nature and art.

The superiority of the French in many branches has made itself felt, not only in composition, form, and execution, but in lowness of price; and thus their productions have been of great material benefit to them, even in a commercial point of view. It has long been the desire of the Art-Union to contribute to the formation in this country of a class of art-manufactures of the highest character. With all the mechanical contrivances so abundant in Great Britain, the feeling for the beautiful ought to keep pace with the progress of science. But although much has been done during late years, yet very much is still wanting to enable us to equal the works of the past schools of Italy, and the past and present schools of our neighbours. There is still a wide field open, as witness the vast difference in the various types of Italian, French, and German taste.

Looking further back, ancient pottery has a dignity and importance scarcely to be overstated. The vases of the Greeks and Etruscans, beautifully simple and perfect in form, are, moreover, inexhaustible storehouses of illustrations of the mythology, literature, thoughts, and customs of those nations. Even the Roman lamps afford many remarkable and valuable illustrations of the history, manners, and doings of the people amongst whom they were made. The brooches, book-covers, and metalwork of the Middle Ages; the drinking-glasses and ewers of an old Venetian; the carved bellows and painted plates of a Florentine dame,—exhibit an amount of invention, grace, and skill, that makes them objects of delight for succeeding centuries, valued beyond price, and carefully treasured.

If the common things of to-day were beautiful, as they might be; if the eyes of the multitude were schooled as to excellence of form, harmony of colour, and fitness for purpose, they would not tolerate a public statue that was imperfect; they would give no praise to pictures without thought and good intention,—to daubs incongruous and crude.

In connection with these views as to common things, views often urged by the Council, Mr. John Leighton has designed for the association a commemorative tazza, or card-dish, to be executed in porcelain. It includes a head of the lamented Prince Consort in the centre, with three groups around it, representing the Prince distributing rewards to students in art, science, and literature. Seraphs bear tablets with views of the first Exhibition building, the Palace of Westminster, and of Osborne. The arms of England, Ireland;

and Scotland, and quotations from some of the Prince's speeches, are also introduced. The design is being carried out by Mr. Copeland, and examples will be allotted to-day. It is right to say that these works are not costly.

Mention having been made of his Royal Highness the late Prince Consort, the Council cannot refrain from joining in the general expression of unfeigned lament for the loss the nation, as well as our revered Queen, has sustained. The Prince had devoted much of his time and great ability to the advancement of the arts in this country, especially in connection with manufactures, and will be held in grateful memory by the nation to the latest ages. The people are seeking to erect a worthy monument in his honour. We may humbly express a hope that this will be made an aid in the advancement of the arts he loved so well, and a noble record of the position they have at this time attained amongst us. The Queen has more and more endeared herself to her loving people by those utterances with reference to her great bereavement which have reached them.

To diversify the objects for prizes the Council have commissioned Mr. E. W. Wyon and Mr. Robert Jefferson to execute two bas-reliefs from Milton, which will be produced in fettle ivory, and distributed. It was sought to make the characteristic of one of these *Grace*, and of the other *Power*; carrying which out, Mr. Wyon has illustrated the lines,—

"Now the bright morning Star, day's harbinger,
Comes dancing from the East, and brings with her
The flowery May, who from her green lap throws
The yellow cowslip and the pale primrose."

while Mr. Jefferson has embodied the lines,—

"Him the Almighty power
Hurled headlong flaming from the ethereal sky,
With hideous ruin and combustion down to bottomless perdition."

Paradise Lost, l. 45.

In addition to these, bronzes of "Caractacus," by Mr. Foley, R.A., will be distributed. Silver medals, by Mr. Wiener, commemorative of the late Sir Charles Barry, R.A., will also form part of the distribution. Other medals are in preparation, in continuation of our series.

It may be useful to reiterate that arrangements are made by which various works prepared for the society may be obtained by subscribers in lieu of prints, if desired, by extra payment.

Vacancies in the Council have been made by the retirement of the Rev. E. Coleridge, T. A. Hallett, Esq., and M. Milnes, Esq.; Mr. Jas. Hogwood has been elected hon. solicitor.

The following is a statement of receipts and disbursements:—

Total amount received	£9,864 15
Expended for printing, advertising, salaries, &c., including reserve of 24 per cent.	2,840 19
Engraving, printing, and paper of the plate "Raising the Maypole"	3,757 6
For the purchase of prizes of all descriptions	3,266 10
	£9,864 15

The reserve fund has reached the sum of £10,591.

The sum of £3,266 10s. has been set apart for prizes, for works to be selected by the prizeholders themselves:—

30 works at £10 each, 22 works at £15 each, 17 works at £20 each, 12 works at £25 each, 6 works at £35 each, 6 works at £40 each, 4 works at £50 each, 2 works at £100 each, 1 work at £200; and 4 bronzes: "Caractacus;" 30 silver medals of Sir C. Barry; 15 pairs of bas-reliefs in fettle ivory; 60 commemorative tazas; 300 sets of etchings after David Cox; 200 porcelain busts of "Apollo;" making in all 709 prizes.

The Council desire to make widely known that the original marble by Mr. Calder Marshall, R.A., "The Dancing Girl Reposing," which was the result of a competition proposed by the Association some years ago, and now valued at the sum of £700., will be the chief prize, and a noble one, in the distribution of 1863. The statue is at present part of the International Exhibition, together with a stand displaying the various bronzes, parian statues, medals, and works in iron, that have been issued by the Association. The wonderful Exposition of the Works of Art and Industry of all Nations, which was but a proposition at the date of our last report, is now a reality, and within a few hours will be opened for examination. In respect of art it may be safely assumed that it will far excel any collection ever before presented to the world. The comparative youth of the British school, not more than a hundred years old, commencing with Hogarth and Reynolds, and including Gainsborough, Lawrence, Hilton, Wilkie, Ety, and Turner, will be obvious.

In the province of art manufacture we shall see how far we have benefited by the lessons of 1851, and the operations of our schools of art throughout the country, and find a fresh point of departure,—fresh excellencies and successes to emulate. These are battles in which all may be victors. That England may not only "hold her own" in the contest, but continue to labour earnestly and wisely in the course that insures success, must be the wish of every lover of his country.

As somewhat in connection with these national interchanges of thoughts and processes, your Council would here refer to an invitation which they received at the close of last year from the city of Antwerp to attend, by representatives, an Artistic Congress there to be held. Professor Donaldson, Edmund Antrobus, Esq., and one of the hon. secretaries, were so good as to undertake the office. The fêtes and sitting occupied nearly a week; 700 artists from Germany, France, England, and elsewhere, received princely hospitality during the whole time. Not simply the corporation and the artists of Antwerp, but the whole population participated in offering homage to the arts. Houses were thrown open, corporate entertainments given, and abroad was seen suspended,—"Welcome all to Rubens' land." Not welcome to Antwerp, but to the land of the remarkable artist whose genius has given Antwerp glory.

Much is required to make the truly great painter. Such, therefore, come but seldom. Their works teach, delight, and mould succeeding generations; and they themselves deserve some share of the honour with which they endow their country,—

"Great is the glory, for the strife is hard."

Every artist must exercise an influence on his age. The question, shall that influence be good or bad, rests with himself, but is materially affected by the tastes of the day and the artistic condition of the public. It has been justly urged that the masses should not regulate art, but art the masses. Nevertheless, we know well how one reacts upon the other. To make the masses lovers of art and judges of art is our especial province. The elevation of the mind should be the principal aim of the arts. Painting should give us pictures that let us into the life of things; join the seen with the unseen; feed with lofty thoughts:—

"Subservient still to moral purposes,
Auxiliary to divine."—Wordsworth, "Excursion."

And sculpture "supply," as Bacon says, "the natural imperfection of things," which seems to him, upon the whole, "the object and intention of all the arts." To obtain artists capable of producing such works, and to lead them to do so, we must have an instructed public to demand and appreciate them. Any expenditure in this direction of education is a wise one, and we may feel assured that whatever aid we give to the fine arts, the fine arts will return to the country. They contribute to elevate as well as to enrich a state.

On the motion of Professor WESTMACOTT, seconded by Mr. HURLSTONE, the report was adopted.

A vote of thanks to the hon. secretaries, Mr. Godwin and Mr. Pocock, having been proposed by Professor DONALDSON,

Mr. HERSEE moved, as an addition, that the sum of £300 be set apart for testimonials to the hon. secretaries.

After some discussion, at the suggestion of the CHAIRMAN, Mr. Hersee's proposal was referred to a committee of subscribers.

The drawing for prizes was then proceeded with.

HOUSE OF COMMONS.

NEW FOREIGN OFFICE.

ON the vote of £15,000 for the new Foreign-office, on Monday, Mr. Ayrton inquired whether the estimate of £200,000 for this work would be the total sum required; whether that estimate was the result of careful calculation or a mere guess; and whether it was intended to strictly adhere to the design selected, so as to avoid all extra charges?—Colonel French hoped that the stone to be used would not be such as had been used in the construction of the Houses of Parliament, and inquired what steps had been taken to provide durable stone?—Mr. Cowper said that the sum of £200,000 was Mr. Scott's estimate, and that gentleman was now engaged in preparing the working drawings to be submitted to the contractors. Of course the House would only be asked for the contract sum. Whatever that was he had resolved that it should not be exceeded. No option would be given to the architect to make alterations as the work proceeded. The design was that exhibited last year, which met with general favour. Regarding the stone to be used, he thought the report of the commission that examined the stone of the Houses of Parliament showed that it would not be wise to use that description of stone; and it was intended to employ Portland stone, such as that of which St. Paul's Cathedral was built.—Sir M. Peto said if the First Commissioner would guarantee that the stone should be of the description used in the erection of St. Paul's there would be nothing to complain of. But it should be known that there were two very different sorts of stone in the island of Portland. The quarries from which the stone was taken to build St. Paul's had scarcely ever been worked since, for the simple reason that the stone was so hard; in fact, some of the stone actually quarried for St. Paul's had not been used for any other purpose on this account. The architects of Sir Christopher Wren's time were good geologists. He was glad to hear from the First Commissioner that it was resolved not to deviate from the original plan of the work, for, if this was not done, there would be endless changes involving large expenses.—Mr. Locke wished to know upon what data Mr. Scott went in returning the estimate for the Foreign-office at £200,000. Unless the architect knew the material which would be used in the building his estimate must be of little worth. To work a hard stone like Portland must be very expensive, and this item must enter into any correct estimate.—Colonel French said the Foreign-office was not to be built in an ornamental style, and consequently the stones used in it would not require an undue amount of labour so as to increase the expense.—Sir M. Peto hoped that a hard stone would be selected. In that case the first expense would be the least.—Lord R. Montagu said it appeared from the estimates that, though the sum of £30,000 had been voted last year, and the sum of £20,000 the year before, for this very Foreign-office, only £3,100 had been expended of the entire amount. For what object, then, could the additional sum be required?—Mr. Cowper explained that the vote was divided into two parts; one for the foundation of the building, the other for the remainder of the contract. The contract for the foundation had been taken out, and the workmen, to secure a good basis, were obliged to sink 18 feet below the surface, the entire sum now voted, in addition to the balances of the preceding years, would be required before the 31st day of March next; but, if any then remained, as it could not be appropriated to other purposes, it would be available for the general purposes of the country. It was impossible to state the precise sum which would be required in any year for this work. He had consulted the report of the commissioners appointed to examine the several kinds of stone; he found that the hardest class of Portland was not the whitest, and, consequently, was not favoured by the public approval. There were some kinds of sandstone so hard that the labour of working them would considerably increase the expense of the building.

The vote was agreed to.

NATIONAL GALLERY.

It being proposed that a sum of £1,705 should be voted for increasing the accommodation for painting and sculpture in the National Gallery in Trafalgar-square, being an excess upon the amount of £15,000 voted for the service in the year ending 31st March, 1861.—Mr. Slaney suggested that on a single day in each week a very small sum should be charged for admission, thereby rendering the company on that day more select; and Mr. Cowper said that the specification could not be made after the original vote was passed, and for the purpose of getting the work done in sufficient time it was necessary to have the work done by day-work, and even to work by candlelight. Improvements were suggested and made as the work went on, and satisfactory reasons could be given in detail why the actual cost of the work had exceeded the estimate. They did not know that the excess had occurred until after the work was completed.

The vote was agreed to.

OFFICE OF WORKS AND PUBLIC BUILDINGS.

On the vote of £30,839 for the office of Works and Public Buildings.—Sir M. Peto inquired to what extent the Chief Commissioner of Works considered himself responsible for this expenditure?—Mr. Cowper said he considered himself responsible for the expenditure incurred upon all public buildings.—Mr. White drew attention to the fact that Messrs. Baxter, Rose, and Co., solicitors of the Carlton Club, were employed by the Board of Works in connection with the measure for the Thames embankment. Would the right hon. gentleman explain why he was driven to the necessity of seeking the assistance of those gentlemen?—Mr. Locke remarked that Messrs. Baxter, Rose, and Co., had the confidence of the railway interest, and their object was not to carry out an embankment similar to that which was now proposed, but to make a railway from Westminster-bridge to Queenhithe. He did think the employment of those gentlemen was very extraordinary, and he would advise the right hon. gentleman to see that his own object, and not theirs, was carried out.—The vote was then agreed to.

WESTMINSTER BRIDGE.

On the vote of £2,500 for the completion of the new bridge at Westminster.—Mr. Williams complained that any further sum should be required, seeing that £173,000 had already been granted, and that a large balance remained unexpended.—Mr. Cowper explained that the vote now asked for was to defray the charges of stairs and other works not included in the original estimate, and said that when all demands of the leaseholders had been satisfied, the balances now in hand would be reduced to nil.—Mr. Ayrton asked whether it was intended to carry out the recommendation of the committee, and provide a subway under the bridge, for the purpose of giving easy access to the Houses of Parliament?—

Mr. Cowper said that a tunnel under the existing road was not part of the original plan, and he feared it could not now be made without considerable expense. Perhaps the object could be accomplished when the embankment should be constructed.—Mr. Locke believed that there was at present an entrance from the bridge which could easily be rendered available. There would be no difficulty in constructing the necessary passage.—Mr. Cowper said that the sum he now asked for would be spent, or was intended to be spent, within the financial year. There was an older sum in hand for buying up property at the approaches to the bridge, which would probably not be spent in the year, owing to the delay of legal negotiations, but it would be very undesirable for the Government to be deprived of the power of completing any purchase whenever it could be effected.—The vote was agreed to; and also a vote of £1,230 for watering the approaches to Westminster-bridge.

FORTIFICATIONS AT PLYMOUTH.

Mr. Bentinck asked the Secretary of State for War whether it was true that an artificial island was being constructed in Plymouth Sound by sinking stones, for the purpose of building on it a fort similar to those which were under construction at Spithead?—Sir G. C. Lewis said it was intended to construct a fort behind the breakwater—not upon it, as originally intended. The foundation was not in the nature of a breakwater consisting of stones thrown down, but the walls would be nearly perpendicular, and the plan of the fort was in accordance with the recommendation of the Defence Commission.

NATIONAL GALLERY, DUBLIN.

A sum of £2,500 was voted, in continuation of former grants, towards the erection of a national gallery for painting, sculpture, and the fine arts, and for the reception of Archbishop March's public library in Dublin.

LIGHTHOUSES.

On the vote of £11,994 for lighthouses abroad, Mr. Childers wanted to know who was responsible for this expenditure, because there appeared to have been a great waste of money in attempting to erect a lighthouse on the Basses Rocks. He wished to know where that lighthouse had been erected on these dangerous rocks?—Mr. M. Gibson said that the Board of Trade was responsible. He was afraid that the lighthouse attempted to be erected on the Basses Rocks and the money expended thereon were gone to the bottom of the sea. After a very considerable expenditure of money the idea of erecting a fixed lighthouse on the Basses Rocks was altogether abandoned. He hoped that the unfortunate endeavour to erect a fixed structure upon these rocks would be a warning to engineers not to attempt so hazardous an experiment in future.—The vote was agreed to.

HOLYHEAD HARBOUR WORKS.

It was proposed that a sum of £101,221 should be voted on account of the new packet harbour and harbour of refuge at Holyhead, and of Portpatrick Harbour.—Mr. Williams complained of the enormous expense of this harbour. It had cost £2,000,000, and he wished to be informed whether the present estimate would be sufficient to complete the works.—Mr. Peel said the question of the pier accommodation had caused much embarrassment to the Government, who had proceeded with it as rapidly as they could. He gave a short history of the measures taken in connection with it, and said the temporary pier was preferred to the stone pier. The Government had come to the conclusion that it was not desirable to proceed with the stone pier, and they had turned their attention to what was necessary for the postal and passenger service of Ireland. Improvements were being made in the temporary pier, which would afford the necessary accommodation. It would be strengthened. This would cost £10,000. A sum of £20,000 would be required to strengthen a curve of which the railway complained.—Sir M. Peto said this was one of the numerous cases in which estimates had been enormously exceeded. There was no guarantee that this work would be completed even now within the present estimate. There ought to be a Minister responsible to the House for these estimates.—Mr. Bentinck said the error that had been committed in regard to the Holyhead harbour was that which occurred in nine cases out of ten—namely, that from false considerations of economy a sum of money was voted which was inadequate for the purpose, the result of this mistimed economy being that a large sum of money was expended in making a bad harbour, upon which it had been necessary to expend a much larger sum in order to render it to a certain extent useful. The harbour as originally constructed was perfectly inaccessible to large vessels, and, therefore, wholly useless except to small coasting vessels. They had spent above a million of money in constructing a harbour of refuge at Holyhead, and they were still using the old harbour for which the new harbour was meant to be a substitute. Except as a harbour of refuge, to be used by those who chose to do so, the harbour upon which all this money had been expended was altogether ignored. He asked whether it was a satisfactory or a rational state of things that having many years ago condemned the old Holyhead harbour as inadequate for the purpose either of a harbour of refuge or of postal communication, they should now spend large sums of money upon it at the same time that they continued to spend money on the new harbour?—This vote was agreed to.

The following votes were also agreed to: £96,342 for public buildings in Ireland; £1,250 for temporary Foreign-office; £10,000 for Industrial Museum, Edinburgh; £903 for the enlargement, repair, and alteration of King's College and Marischal College, Aberdeen, and a vote of £5,000 for the construction of a new Record-office in Dublin.

MONUMENT TO THE LATE DR. ALEXANDER AT PRESTONPANS.—A statue is to be erected at Prestonpans to the memory of the late Dr. Alexander. The site is on the south side of the main street, towards the east end of the town. The pedestal will be reached by two flights of steps, and surrounded by a gravelled plateau, so that a near view of the statue on all sides may be accessible. The statue is by Mr. Brodie, of Edinburgh. It is eight feet in height. The figure is represented attired in the full uniform appertaining to the rank which the deceased held as Director-General of the Medical Department of the British army, with the left hand supported on the hilt of the sword, and the right resting on the waist-belt. A military cloak hangs over the shoulders of the statue.

Correspondence.

LIGHTHOUSES ON THE GOODWIN SANDS.

SIR,—I will thank you to allow me to direct public attention to the great necessity for building two lighthouses on the Goodwin Sands. I propose to sink a shaft of wrought iron, 90 feet in diameter, through the sands into the solid chalk, braced and cased with masonry, secured by vertical wrought-iron bars from the base to above high water mark, each course bonded with plates, the bars passing through the latter to insure sound construction; I also propose to put down four iron screw-piles, 8 feet in diameter, with booms attached, secured to the lighthouses with iron chains inside, and above high-water mark. I would have a steam-engine, gasworks, and a refuge for shipwrecked mariners and others. In case of a ship getting on the sand, a hall and rope may be projected from the lighthouse across the vessel, and a hawser once secured the vessel might be drawn with ease by the engine, acting as a stationary tug. I have no hesitation in stating that the whole work may be performed for £5,000, and completed within twelve months.

JOHN NOTT, C.E.

TENDERS.

DWELLING HOUSE, STREATHAM.

For house and stables at Streatham. For F. Fuller, Esq. Mr. R. W. Drew, M.A., architect. Quantities supplied by Mr. J. A. Bunker.

Williamson	£3,200	Carter	£2,945
Pritchard and Sheldon	2,970	Turner and Sons	2,797
Dowds	2,965	Trollope and Sons	2,743
Child and Son	2,897	Deacon	2,670

PARSONAGE, BERKS.

For the erection of a Parsonage House, at Fawley, near Wantage, in the County of Berks. Messrs. John Money and Son, architects, Northbrook-street, Newbury.

George Adey and Son	£1,359	John Haines	£1,195 10
Robert Messenger	1,250		

CHURCH, CHATHAM.

For the erease of a church in the Maidstone-road, Chatham. Mr. Henry Clutton, architect, 9, New Burlington-street, W. Quantities by Mr. Crocker.

Sutton and Vaughan	£2,169	Ansell	£1,810
Stump	1,847	Spicer	1,695
Naylar	1,837		

CHAPEL, LIVERPOOL.

For new congregational chapel, West Derby-road, Liverpool. Messrs. Penlton and Woodman, architects, Reading.

Tomkinson	£4,033	Mollin	£3,618
Yates	3,845	Bateman	3,525
Nicholson and Co.	3,839	Burroughs	3,407
Haigh	3,795	Nelson (accepted)	3,362
Roberts	3,730		

ROADMAKING, GRIMSBY.

For the formation of about a mile and a quarter of road and drainage in the East Marsh. J. Barry

J. Barry	£4,268 17 9	A. Huston	£3,376 10 0
T. Enderby	3,640 0 0	J. Waller (accepted)	3,350 10 0

DWELLING-HOUSE, PENGE.

For a house at Penge, Surrey, for James Covell, Esq. Mr. Henry Jarvis, architect.

Bottom and Co.	£963	Glenn	£930
Crawley	915	Tarrant	789
Marland and Son	880	Kent	775
Pugh and Wallis	875		

WAREHOUSES, LONDON.

For new warehouses for Messrs. Marzeth and Co. Messrs. Whales and Sparks, architects.

Jacobs	£8,495	Haeh	£7,997
Brown and Robinson	8,310	Corder	7,960
Ryder	8,200	Hill, Keddell and Robinson	7,748
Axford	8,150	Myers	7,438

COMPETITIONS OPEN.

CATHEDRAL.

CORK.—Architects are invited to furnish designs for the erection of the cathedral of St. Finbar, Cork, at a cost not exceeding £15,000. A premium of £100 will be given for the best and most approved plan, and £50 for the second. Plans and designs to be sent to the hon. secretaries, [Ven. the Archdeacon of Cork, Rev. J. N. Woodroffe, or T. M. Osborne, Esq. Cork, not later than the 1st August next. Further information and a plan of the site may be obtained on application to W. C. Bennett, Esq., notary public and Chapter clerk, 15, South-mall, Cork.

SCHOOLS, &c.

LANCSHIRE.—For the erection of the proposed new schools, vestries, &c., Rawtenstall, Lancashire. Plans, &c., with Thomas Simpson, architect, Nottingham, to May 10th, inclusive; and at Rawtenstall, on application to Thos. Hoyle Whitehead, Esq., on and after the 12th May. Printed quantities will be supplied on application to the architect. Tenders to be delivered to Thos. Hoyle Whitehead, Esq., Rawtenstall, on or before the 21st of May.

CEMETERY WORKS.

CHELTENHAM.—The Burial Board for the borough of Cheltenham require plans, estimates, and general specifications, for the laying out, constructing roads and footpaths, erecting buildings on, fencing in and planting, certain lands purchased by them for a cemetery, the superficial area of which is eighteen acres. The designs must include a ground-plan, showing the sites of the different buildings required, the courses of the carriage-roads and walks, the courses, also, of the drains, the division of the land into the several sectional burial-places, and the subdivision of such places into plots for burial. The plan, also, should show the manner proposed for the ornamental planting of the land. Should the intentions of the designers as to the laying out of the land under it necessary, sections of the earthwork required, and formation of the ground surface as proposed to be made, should be provided, and such other details and suggestions as the competitors may think necessary to illustrate and make clear their designs. Plans, elevations, and sections must be provided for two chapels, dead-house, lodge, gates, and walls at entrances, &c. Specifications must accompany the plans, describing the manner of construction, the class and substance of material in the several buildings, and estimates of their several costs. Plans, specifications, and estimates of the number of laying out and planting the site, of forming and making the roads and footpaths, and of the character and cost of fencing the site, to be also provided. Plans, &c., may be either for forming and finishing the roads and footpaths, laying out and planting the site, or for fencing the site, or for the chapels and other buildings before mentioned, and the entrance-walls and gates, or the whole of the works, may be combined in the plans, &c., of any competitor; but the Board reserve the right of selection at their discretion from the plans, &c., submitted to them. A premium of forty guineas will be given for the best designs, specifications, and estimates for the whole of the works sent in; and a premium of twenty guineas for the second-best designs, specifications, and estimates for the whole of the works. Should designs, &c., be selected for part of the

works only, a fair arrangement as to the premium will be made by the Board, with the successful competitors. The plans, &c., selected to become the property of the Board. The plans, &c., are to be distinguished by a mark or motto, and accompanying them a sealed envelope, having the same mark or motto outside, and within the name and address of the designer, and the terms on which he will superintend and supply his professional services in execution of the works. Plans and particulars of the land may be had of Mr. Henry Dangford, borough surveyor. The plans and other documents to be sent to G. E. Williams, clerk to the Board, Public Offices, Cheltenham, on or before the 29th May.

LIBRARY AND READING ROOMS.

BIRMINGHAM.—The Free Libraries' Committee of the Council of the Borough require plans, sections, specifications, and estimates for the erection of a free reference library and reading-rooms, lending-library and news-room, and gallery of art, upon the piece of vacant land adjoining the Midland Institute Building, with an elevation uniform with the said building. Intending competitors are requested to send in their plans, specifications, and estimates, under cover to Thomas Standbridge, town clerk, Town clerk's office, Temple-street, endorsed "Plans for Free Reference Library Buildings," on or before the 16th June. Particulars of the accommodation required, and of the conditions of competition, together with a lithographed plan of the site, may be obtained on application.

MEMORIAL.

GLOUCESTER.—The committee appointed to carry out the Hooper Memorial, at Gloucester, invite sculptors to submit models of designs for the figure of Bishop Hooper, which is intended to be placed under the canopy of the monument just erected in the churchyard of St. Mary de Lode, Gloucester. The models or statuettes to be carved in stone, and to be one-quarter the real height (7 feet). The author of the best design, approved by the committee, will be appointed to execute the full-sized figure; and the sum of ten guineas will be awarded for the second-best design.

DRAINAGE.

KINGSTON.—The Corporation of the borough of Kingston-upon-Thames invite engineers and others to submit plans, specifications, and estimates for a thorough and complete system of drainage of the borough, and offer a premium of £100 for the plan approved, retaining the liberty to carry it out or not. The plan approved to become the property of the corporation. The system of drainage to blend, as far as practicable, with existing drains, to plans and descriptions of which are at the Town Clerk's office. The plans, Clerk's office also the commission for carrying out the works, to be sent to the Town &c., stating on or before the 17th day of May next.

CONTRACTS OPEN.

PUBLIC BUILDINGS.

EDINBURGH.—For the erection of a large building in Edinburgh. Plans, &c., with Mr. Henderson, architect, 7, Hill-street, Edinburgh. Tenders to 15th of May.

LIMERICK.—For the erection of new offices and board-room, in White Horse-street, Commercial-road East, for the District Board of Works. Drawings, &c., upon application to Mr. Charles Dunch, architect, White Horse-street, Commercial-road East. Tenders are to be delivered at the offices of the Board not later than 12 o'clock on the 5th day of May.

DARLINGTON.—For the erection of Darlington new market, town offices, and clock tower, Plans, &c., with George Dickinson, C.E., Surveyor to the Board, Central-buildings, Darlington, or at the office of Mr. Alfred Waterhouse, architect, Mount-street, Manchester. Tenders to Mr. Dickinson, endorsed "Tender for Darlington Market, &c." and addressed to the Chairman of the Darlington Local Board of Health, on or before 5th May.

WIGTOWN.—For the erection of a new court-house at Wigtown, Wigtownshire, with public offices, &c., attached. Plans, &c., with James McLean, clerk of supply, Wigtown, to whom written tenders on or before 12th May.

CHESTER.—For the proposed extension of Chester corn market, with entrances to St. Werburgh-street, and the city-walls, together with several shops and warehouses connected therewith. A copy of the plans and specification may be seen at the corn market, upon application to Mr. Chivas, 28, Eastgate-street, Chester, and further particulars from Thomas M. Penson, architect, The Bars House. Tenders to be sent in on or before 12th May, by 12 noon, addressed to Mr. Chivas, Eastgate-street, and endorsed "Tender for intended Corn Market."

MARKET BUILDINGS.

BATH.—For the erection of iron roofs, masonry, and other works involved in the reconstruction of the Bath provision markets. Plans, &c., on application to Hicks and Isaac, architects, 13, Northgate-street, Bath, from May 3. Sealed tenders to the Town Clerk, Guildhall, Bath, for the separate trades, endorsed, "Tenders for the reconstruction of Markets," by the 15th of May.

BANK.

LINCOLNSHIRE.—For the erection of a bank and manager's house at Spalling, for the Stamford, Spalding, and Boston Banking Company. Particulars from Mr. William Eve, surveyor, 3, Union-court, Old Broad-street, E.C. Tenders on or before the 17th May.

CHURCHES.

YORK.—For the erection of a new Catholic church and presbytery, to be built in the City of York. Plans, &c., at the Very Rev. Joseph Rinder's, Precentor's office, Petergate, York; or at the office of the architect, George Goldie, Esq., 34, Gloucester-place, Portman-square, London, from May 5 until May 14, on which day sealed tenders are to be forwarded to the Very Rev. Joseph Rinder, Precentor's-office, York. Bills of Quantities may be obtained on application to Thomas Wilson, Esq., No. 7, Hanover-square, Sheffield.

HILGAY.—For the repair and restoration of Hilgay parish church. Plans, &c., with the Rev. W. J. Parkes, on the spot.

SOMERSET.—For repairing and reseating the parish church of Carhampton, near Dunster, Somerset. Specifications, &c., at Carhampton, on application to the Rev. John Tripp, or the Church wardens, to May 12th inclusive. Tenders to be sent in addressed to the architect, Mr. C. E. Giles, 52, Westbourne-park-road, Bayswater, London, W., on or before the 12th May.

RAGGED SCHOOLS.

MARYLEBONE.—For the erection of ragged schools in Ogle-mews, St. Marylebone. Drawings, &c., with Mr. W. P. Griffith, architect, 16, Guilford-street, Russell-square, to May 6th. Tenders to be delivered, under seal, to P. Pitts, Esq., hon. sec., 54, Foley-street, on or before May 7.

BRIDGE.

GATEHOUSE.—For building a new bridge over the river Fleet, at Castrament, in the parish of Girthon. Plans, &c., with Mr. Ewart, Bank of Scotland, Gatehouse, who will receive offers till the 20th May.

DWELLING HOUSES.

HANSTANTON.—For the erection of three first-class, four second-class, and four third-class houses, at Hanstanton, for the Hanstanton Building Association (Limited), according to plans, &c., prepared by Mr. Butterfield. Plans, &c., at the office of Mr. J. S. Valentine, C.E., 17, Parliament-street, Westminster; or with Partridge and Edwards, Solicitors to the Association, King's Lynn; or copies will be forwarded on prepayment of 2s. Tenders, stating a separate amount for each class of house, marked "Tenders for Building at Hanstanton," to be delivered to the solicitors on or before the 14th May.

FARM BUILDINGS.

DEVON.—For the performance of alterations and erections at Hayes Farm, in the parish of Poltimore, in the county of Devon, in the occupation of Mr. Joseph Gould, for the Right Honourable Lord Poltimore. Plan, &c., with Mr. Robert Hews, Poltimore, of whom any further particulars may be obtained. Sealed tenders (to be marked as such), on or before the 14th May, directed to Messrs. Riccard and Son, Southmolton, Devon.

HEREFORD.—For erecting a farmhouse at Pontplinna, near Furnaston, Herefordshire. Plans with T. Nicholson, architect, Hereford, to whom tenders by May 14.

LANCASHIRE.—For the erection of several farm buildings, at Ince Blundell and Fearnby Plans, &c., with Mr. Mawden, foreman of joiners, Ince Blundell. Tenders to be sent before the 10th May, to Mr. T. F. Fisher, steward, Ince Blundell.

OIL MILLS.

GLOUCESTER.—For the proposed building, to be erected at Gloucester, for Messrs. T. N. Foster and Co. Plans at the Spread Eagle Hotel, Gloucester, to the 9th May inclusive. Tenders to be addressed to Messrs. T. N. Foster and Co., Evesham, on the 13th May, endorsed "Tender for New Oil Mill."

SHOPS, &c.

RADNOR.—For erecting three shops, houses, and offices, at Knighton, Radnorshire. Plans, &c., with Mr. Grenhouse, Norton, near Prestegyn; particulars from T. Nicholson, architect, Hereford; to whom tenders by May 7.

STABLING.

SALTBURN.—For the erection of stabling to the Zetland Hotel, at Saltburn-by-the-Sea. Plans, &c., at the offices of the Stockton and Darlington Railway Company, in Darlington, to May 7th. Tenders to be delivered not later than the Thursday following, addressed to the secretary, and endorsed "Tender for Stabling."

POLICE STATIONS.

SIDMOUTH.—For the erection of a police station, &c., at Sidmouth, Devonshire. Plans, &c., with Henry Ford, Clerk of the Peace, Castle of Exeter, and at the office of Messrs. Radford and Williams, Clerks to the Justices, Sidmouth. Sealed tenders, endorsed "Tender for Sidmouth Police Station," to be sent to Mr. Ford, on or before the 3rd June.

RAILWAY WORK.

INVERNESS AND PERTH JUNCTION RAILWAY.—For the construction of the two remaining sections of the line, viz.:—The Kingussie contract, extending from Kinross Post-office to the south side of the river Spey, measuring about 13 miles or thereby, comprising about nineteen small bridges and culverts, with a timber viaduct about the Spey. The excavations and embankments consist of about 470,000 cubic yards. The Dalwhinnie contract extends from the south side of the Spey to the boundary of the county of Perth, measuring 15 miles or thereby, and consists of thirty-two small bridges and culverts, and about 430,000 cubic yards excavations and embankments. The rails, chairs, sleepers, spikes, fish-plates, and bolts will be supplied by the Railway Company. Drawings, &c., at the office of Joseph Mitchell, Esq., C.E., Inverness, from whom, or from the assistant-engineer on the line, duplicate schedules may be obtained, at £2 2s. each. The line is staked out at distances of every 100 feet, according to the working sections. The deepest cuttings are also pitted to ascertain the nature of the materials in the excavations. An assistant-engineer will be at the County Marsh, near Dalnacardoch, on the 20th May, at 10 o'clock a.m., to accompany the contractors over the Dalwhinnie contract; and at Spey-bridge, near Kingussie, on the 21st, to go over the Kingussie contract, and to point out the works and sites of the bridges. The draft contract proposed to be entered into will be seen with the assistant-engineer, or at Mr. Mitchell's office. Sealed tenders, addressed to the secretary, and marked "Tender for Inverness and Perth Junction Railway Works," "Dalwhinnie" or "Kingussie Contract," as the case may be, must be lodged at his office, on the 28th May, at 4 o'clock p.m.

EXETER.—For the erection of a roof for the new station at Exeter, of the Bristol and Exeter Railway, having an area of about 500 squares. Drawings, &c., at the Engineer's Office, Bristol Terminus, to the 5th of May. Sealed tenders to be addressed to the Secretary, A. Moore, Esq., on or before the 6th May.

ENAMELLED SLATE FOR THE EMPRESS OF THE FRENCH.—Her Majesty the Empress Eugenie having commanded samples of enamelled slate to be submitted to her, Mr. Magnus, of the Pimlico Slate Works, the inventor and patentee, whose beautiful productions obtained so great a share of admiration at the London and Paris Expositions, has been summoned to Paris, and has received the personal commands of Her Majesty to line the walls of two dining-rooms with enamelled slate to represent various choice and costly marbles. The architrave and other mouldings, chimney-pieces, and pilasters, are all to be of the same material.

THE NEW BRITISH CHURCH, NAPLES.—The committee appointed to build the Protestant Church, at Naples, invited twelve architects to supply them with designs. They have adopted that furnished by Messrs. Thomas Smith and Son, 33, Bloomsbury-square, and which are to be forthwith carried into execution under their superintendence. The design is in the English Gothic style of the geometric period, and consists of nave, north and south aisles, transepts, and chancel, with hexagonal apse; there is also an organ-gallery over the vestry, and a carriage porch at the west end. Accommodation is provided for 700 adults on the ground floor. These architects are now building the church at Nice, which is nearly finished.

STEAM FIRE ENGINES.—The superintendent of the London Fire Engine Establishment has made a report to the committee upon the performance of the new steam fire-engine, constructed by Shand and Mason, and tried last week at Hodges' distillery, Lambeth. He reports that the engine started with steam of 60 lb. pressure in 14½ minutes from lighting the fire, cold water being used. The hose was led to the base of Mr. Hodges' chimney, which is 140 ft. high, and notwithstanding the great force of the wind at the time, a 1½ inch jet reached an elevation of some 30 ft. above the chimney, being a total height of 170 ft. The same jet was projected 190 feet in a horizontal direction, but as Captain Shaw measured solid water, and not spray, at least 15 per cent. ought to be added to this for the farthest point reached by the water, giving a total of 220 feet. In like manner when two jets, each 1 inch in diameter, were worked at the same time, the distance reached by the water was 150 feet. In this engine, and in the other supplied by the same makers to the London Fire Brigade about eighteen months since, the water in the boilers is kept at boiling point by a jet of gas, and 50 lb. pressure is raised in five minutes from lighting the fire.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

H. H.—Send name and request shall be complied with.
T. R. O.—Thanks for suggestion. Other subjects are being prepared.
S. B.—Desired with thanks.
R. R.—There should be no difficulty in the matter; try again.
S. W. G.—Impossible to comply with such requests.
R. M. W.—J. F. P.—We cannot give the names of any writers engaged on the BUILDING NEWS.

Q. D.—Shall be engraved.
D. B.—Thanks; a notice had appeared previously.
Z. A.—Look for a reply next week.
J.—We cannot say when.
F. H. F.—Quite willing to accept, and pay for, good things.
A. SENSCHER.—Thanks.
S. M. N.—Below our mark.
BIRMINGHAM FREE LIBRARY.—A reply to Mr. E. M. Barry's letter on this subject came to hand too late for insertion this week.
F. W.—A. K. K.—V.—B. K. R.—P. C. K.—Next week.

* * * All communications to be addressed to the Editor of THE BUILDING NEWS, 20, Old Broad-street, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 18 to 21, Old Broad-street.
Advertisements are received up to six o'clock on Thursdays.

THE BIRMINGHAM AND MIDLAND INSTITUTE.

THE Town Council of Birmingham have lately issued an advertisement inviting plans to be submitted in competition for the erection of a Free Library and Reading Rooms "upon vacant ground adjoining the Midland Institute building, with an elevation uniform with the said building." This advertisement, except that no premiums are offered, is not so widely different from the ordinary run of architectural competitions as to induce any architect willing to compete for public works to suspect that there could be much amiss, and it will probably have attracted notice from a good many persons.

The real facts of the case are not, however, those which the reader of this advertisement, if not otherwise aware of what had occurred, might reasonably believe them to be. This is not really a new building which is proposed to be built in a style such as will correspond with some already completed and successful ornament of the town; nor is the case one in which the Town Council are free from previous engagements. The proposed erection is in reality the completion of the Midland Institute

—a hitherto unfinished building; and the Town Council have only had recourse to competition, after first employing and then setting aside one of the first architects of the day.

The letter of Mr. Edward Barry, which will be found in our number for the 25th April, in which he gives a brief, clear, and temperate statement of his view of the case, will no doubt have been read by most, if not all those who have seen the advertisement.

We this day publish a letter, forwarded to us by the Town Clerk of Birmingham, containing a counter statement, intended to serve as a defence of the Town Council in what they are doing. Beyond the somewhat broad statement contained in the first paragraph—which is not, however, couched in quite the most vigorous and briefest terms which might be used to express the same thing as the words "not in accordance with the facts"—this letter is, like Mr. Barry's, temperate and well expressed; but it fails to alter, to any great extent, the impression which we had derived from Mr. Barry's statement.

It may be remembered by some that the Midland Institute formed the subject of a limited competition some seven years ago, and that Mr. Barry's design, which received a great deal of praise at the time, was adopted, and, as far as funds were forthcoming, was carried out. The means in hand, however, only sufficed for the erection of one half the building, and it is the completion of this unfinished building, and not the addition of something different, which is now contemplated.

Further, the Birmingham Town Council, having this completion in view, applied in the first instance, and very properly, to Mr. Barry, and we learn from his letter that he prepared, at their request, a full set of drawings and specifications, and that tenders were procured; these, however, were higher than had been anticipated. Mr. Barry states that upon this he "at once offered to forego all claim for remuneration for what he had done, and to prepare new plans to suit the financial exigencies of the case;" and that the Committee at once accepted the first part of his offer, but that the only answer to the other part was that invitation by public advertisement to architects to submit plans to which we have before referred.

The answer to those parts of this statement which tell against the Town Council does not seriously alter them; it merely informs us of a considerable amount of negotiation, such as must naturally have occurred under the circumstances, and it puts us in possession of the amounts of the preliminary estimate and subsequent tenders. The discrepancy between these amounts is very serious, and shows that Mr. Barry was in a position in which he could not honourably do less than what he proposed to do—namely, to prepare new plans without charging for the old ones. It must, however, be most distinctly understood that this offer is not equivalent to a resignation of the appointment as architect to the building, and that the only way in which that appointment could fairly, and, we believe, legally, be taken out of Mr. Barry's hands would be, notwithstanding such offer, by paying him in full for all he had done in his capacity of architect. It appears, however, from the Birmingham letter, that a small sum has been paid to Mr. Barry, but this must clearly have been for preliminary sets of sketches, and not for the working plans and specifications and services in procuring tenders; for the amount paid to

Mr. Barry was £45, whereas the lowest sum that, in accordance with professional usage, he could have charged for the complete set would be 2½ per cent. upon his own estimate, or £262 10s. Yet this payment of £45 is put forward more than once, and dwelt upon as a strong point in the letter.

The gist of the matter appears to be this: after all the trouble had been gone through, and reductions had been proposed, and their feasibility investigated by Mr. Barry, he was able to see his way to bringing down the cost to £12,250 and no lower, and was prepared to make plans, &c., on that basis; but the Town Council determined if Mr. Barry would not say that the building could be erected for the amount which he had at the outset mentioned—namely, £10,500—that they would find some one else who would say so. This could, of course, only honourably and legally be done in one of two ways,—either Mr. Barry must resign his appointment, or he must be paid off. It is clear, however, that no resignation has ever been sent in, and equally clear that no payment, beyond the £45 referred to already, has been made; yet Mr. Barry is now told, not that his services will be dispensed with, in the only manner in which that could be properly done, namely, by his being paid for all that he has already done, but that he is not to be paid, and the matter is to be put into other hands. Of the injustice of such a course there can be, we think, little room for doubt. We are glad, however, that Mr. Barry has carried the matter further, and has procured legal advice; and still more so that the opinion furnished him is "that the proposed competition cannot legally be carried out."

Appended to Mr. Barry's letter is a statement signed by five of the architects engaged on the original competition, from which we learn that a distinct engagement was entered into with the competitors, that the successful one should be employed as architect of the building, which engagement forms part, but, probably, not the strongest part, of Mr. Barry's claim upon the Town Council. The principal part of it is the very simple fact that Mr. Barry having been appointed architect, an attempt is being made to displace him in a way which will probably prove unsuccessful, but which shows clearly that the persons making that attempt are not aware of the legal and equitable position held by an architect when once appointed, or, if aware of it, have not thought proper to act up to their knowledge.

We think that this flagrant but not solitary instance of the way in which architects are treated should not be lost upon the profession. It must have been suspected that certain members of it—and those not the most obscure or the most needy—possess a readiness to secure business under any circumstances and at any cost which cannot be called by a milder name than rapacity, or else surely no committee would venture to treat a prominent man with gross injustice, and then expect that members of his own profession, experienced enough to be fit to carry out a large public work, will flock in a shoal to offer themselves as ready to submit to the same sort of treatment for the sake of possibly earning a few hundreds. Is there any ground for this? Have the architectural body uniformly shown themselves high-minded, disinterested, and willing to forego personal advantage when they could not honourably obtain it; or have there been instances of sharp practice, of unfairly taking work out of a brother architect's hands, of charging half commission to the client and making it up by getting five or ten per cent. from the builder, of submitting to humiliating conditions sooner than be excluded from a competition, and of interest, disclosing of mottoes, and underhand work when once admitted? We are not going to pretend to answer these questions, but we do say that if such things exist, and if those who do them are not stigmatised by the profession at large, but remain identified with its most respectable members in the public estimation, we have possibly in that fact a clue to the estimate formed of the architects of England by the Town Council of Birmingham.

We have very lately taken occasion to urge the desirableness of some such alliance between the architectural societies of England as was proposed last year, and we consider that this insult to the profession, and some others of the same class which we could name (including among them certain things which have risen out of the Great Exhibition building controversy), are so many arguments which speak loudly in favour of all proposals that will tend to promote a better understanding among architects.

The conduct of competitions offers but too many inducements to underhand dealing, and we earnestly hope that gentlemen who are so circumstanced as to be induced often to enter upon these struggles will be on their guard to maintain a high standing. It is on some accounts to be regretted that every invitation which appears should call forth so much painfully expended labour and thought, where only one, or at most two or three, can be rewarded by even a recognition of their merit; not that competitions may not advantageously employ the leisure of young men who are entering on practice, and who do not find their time fully occupied, but because the exhibition of this large amount of gratuitously expended labour cannot but tend to "cheapen" the profession in the eyes of the public, and cause it to be supposed that men who will do so much for a remuneration neither certain nor even very probable, will submit to mean usage, poor pay, and disrespect when they are actually employed professionally. Such a supposition is, as a general rule, totally wide of the truth, but still architects cannot be too careful to show that if they are prodigal of their efforts in those instances where honourable rivalry or the possibility of obtaining professional distinction, and consequently emolument, call for exertion, they know what is demanded of them by considerations of self-respect, and of the respect due to others.

To return to the question immediately before us, we have expressed

our hope that the architects of England will take a lesson from it. Among other matters, we hope that they will see how desirable it is to prepare preliminary estimates with great care and accuracy, for there can be no doubt that had the preliminary estimates in this case been a more just one, this unseemly squabble would never have occurred. We hope that Town Councils and other public bodies of the sort will get a lesson also. It would gratify us to be able to hope that the architects of England themselves will give this lesson, and that the Town Council of Birmingham will find themselves without a single plan sent in in answer to their advertisement. And it appears clear that if plans are sent, and the competition is decided, the matter will not thereby be set at rest. The Town Council state that they have not acted "unadvisedly"—a figure of speech meant to imply their having taken legal advice—probably that of their town clerk; their architect also states plainly that he has placed the matter in the hands of his solicitor. Between a wealthy and angry town council and a prominent and energetic architect, the "successful competitor" will probably find his position none of the pleasantest, and he may consider himself lucky if he escapes with something short of a chancery suit.

Is the premium and the profit worth the risk and the obloquy? We think not.

ROYAL ACADEMY.

THE great feature of the present exhibition is the quantity of excellent and painstaking work. We say "work," because the productions of the year are more remarkable for labour, patient study, and very minute manipulation, than for novelty, the grand, or even the imaginative. As the first men will not rise, they must not be annoyed or surprised if the second-rate men, by sheer care and industry, rise to their level; the only difference seems to be that the latter do not rise at all times—indeed, very rarely—to the same good place in the exhibition. Several of the Academicians are, as it has been said, "conspicuous by their absence;" but, to our mind, the absentees are not conspicuously missed, especially as many of the good men who have exhibited seem to have expected an influx of foreigners in consequence of the International Exhibition; and although they have not displayed any novelty of subject nor increased poetry in treatment, have evidently done their best in the old and beaten path. In some instances there has been a change for the better as regards colour and execution, but the ideal of English art remains in the same place it left last year, and in the place it has occupied during many years past. Besides the old subjects by old favourites being better executed and rendered more perfect as works of art, we have a change in what has been generally known as pre-Raffaellite art. The walls of the Royal Academy show scarcely one instance of that abuse of the term, and even Mr. Millais seems to have been "drubbed" by critics into common-sense, and is endeavouring to paint like other people, and, it would appear, has resolved to take his stand undistinguished by eccentricity, and allow his works to rest on their artistic merits; but, although we do not wish to triumph over a fallen foe, we must remark, if that be his determination, it comes rather late, and unfairly; because, by playing the mountebank in painting for a few years, he has stepped over the heads of men superior to himself when he returns to legitimate art, and, from his previous experiments on the ignorance of the public, obtains more general notice for his pictures than their real merits would have obtained for them had he not been known as the leader of a certain section, and been raised into notoriety by the absurd praise and the bitter censure which that position has obtained for him. Besides which, we feel quite certain that had it not been for the shillings the controversy brought to the coffers of the Royal Academy, he never would have been honoured by being made an Associate of that respectable body,—the shilling is the great moving power with the Council of the Royal Academy, and they seem to think that the degradation of art is well purchased at the price.

As the natural course of our remarks, after several visits to the great shilling show in Trafalgar-square, has led us to single out Mr. Millais, we will commence our brief notice for the present with his three pictures. His grand picture, as we suppose he intends it to be considered, is a rather rational successor to several puerile absurdities which have occupied the same place from the same pencil on former occasions. Now, if this picture was not sought out by the public on account of the painter's name, we are quite certain that it would attract very little notice, for the truth is, with the exception of one face, it is not a bit better than a picture of the same kind by Charles Landseer, and in many parts, as regards execution, it is a great deal worse. It is entitled "The Ransom." The story is not well told, for every critic gives a different version of it, so we will not make "confusion worse confounded" by making the attempt. "Trust Me" is his next picture of importance, judging by the hanging. This is so indefinitely made out as regards the artist's intentions, that numerous versions have been given also of this; but, thinking them all wrong, we will offer an explanation of our own. A gentleman prepared for the hunting field holds a leathern pouch in his hand, his daughter or his wife holds a letter behind her, not inclined to put it into the pouch. The fact, as we conceive it, is, that she thinks he will be so engrossed in riding to cover that he will forget to call at the post-office and leave the letters, therefore she is afraid to trust him. The only merit of this picture is that Mr. Millais has been so well drubbed—there is no other term for what we mean—for painting metallic dresses instead of silk ones, as the copper dress of the lady in the hidden royalist (we forget the exact title), and the tin dress in the "Black Brunswicker," that at last he has condescended to paint a dark silk dress as it should be painted; but, as for the rest of the

picture, it is remarkably feeble. We may observe, by the way, that the fine old English gentleman in the hunting suit is very like Sir Francis Burdett of former days, and, if we mistake not, the lady bears a strong resemblance to Mrs. Millais, recently Mrs. Ruskin. The third picture is the parable of "The Woman seeking for a Piece of Money." There is nothing in this but a candle-light effect, and it would be hardly worth further notice if it were not necessary to make one remark. It has been said that the pretended truth laboured for by the pre-Raffaellites would lead to the power of expressing the real truth in the broad manner of the old English school; but here we have the test: the candlestick held by the woman is painted with one or two smears of the pencil, but at no distance does it give the character of the thing intended; therefore the practice of painting detail according to the pre-Raffaellite system does not lead to masterly execution. Why? Because their illusions are obtained by "fumbling," and do not result in characteristic expression of a general truth that at a proper distance becomes the truth itself.

It is hardly worth the space we have devoted to this part of the exhibition, but, as there are no other pre-Raffaellite productions of importance, we conclude from this marked change in Mr. Millais that it is admitted the bubble has burst, and we therefore remind buyers of that style of art that from the first we warned them, no matter what price they gave for such pictures, they would live to turn the faces of them to the wall, and that their heirs would consign them to the lumber-room.

Now to a more pleasing occupation, mainly in praise of honest and legitimate art. Upon the whole, we think "The Tosseller," by the veteran Mulready, is the finest picture in the exhibition. It is a study of a negro selling a toy to a child that turns away from him in alarm; but the great beauty of the picture is the facility and breadth with which the black man is painted, and the patient expression of endurance of infantine disgust and alarm to which, no doubt, he is well accustomed. The mother and child are well drawn and painted, but the lights on them are so much enforced as to give them the disagreeable appearance of being in a violent state of perspiration. The landscapes by Creswick are very fine this year. "The Half-way House" is, we think, the finest of them all. Mr. Bottomly has had a share in this production, and therefore we conclude that the team of horses comes from his pencil. Besides the subdued tone which pervades this picture—no positive colour appearing to mar the general effect—we admire the fine semicircular line of composition commencing with the man seated on the right reading the newspaper, carried along the dray and the horses, terminating in the old woman trudging along the path in the middle distance. The foreground line, including the dray and horses, is supported by a dog running after geese, which again compose with the aforesaid old woman. Across, and just above the horizon, is a fine bank of clouds, giving fulness to the foreground subject, and confining the eye to the interesting part of the picture. The white local colour of the geese is very properly made the principal light in the scene, contrasting with the breadth of half-tint in which the rest of the foreground is subdued. All Mr. Stanfield's pictures are excellent this year, as are those by Mr. Roberts. The Linnels, without abandoning those striking effects in which they delight, are sobered down to more rational combinations and better focussed results.

Mr. Ansell has quitted Spain and returned to the Highlands. In his picture of "Dunstaffnage Castle in the Distance" he gets a great breadth of light from the dust thrown up by a flock of sheep travelling away from the spectator, but we think he has disturbed that effect by bringing the group on the bridge so distinctly off from the sky background. All the boulders, bridge, and other accessories in the foreground, display a sameness of touch, which implies more the expedition of the manufacturer than the true feeling for art. His other picture is entitled "Excelsior," and gives him an opportunity of painting some Mount St. Bernard dogs, which he has done with less hardness of touch than usual, and the monks are also broadly and vigorously painted. Several of Mr. Witherington's landscapes, we think, are less mannered than many we have seen for some years past. "How Bianco Capello sought to poison her Brother-in-Law the Cardinal de Medici," from the history of Florence. There is much ease and composure in the face of the Cardinal, who has detected the attempt to poison him; the husband is also well executed; but the lady herself, in her facial expression, would do much better for a phantasmagoria than a picture; it is this exaggeration and some mediaval feeling that spoils what would otherwise be a good picture. It is by V. C. Prinsep. Mr. Leighton has made an advance this year, which fully justifies the favourable notice he obtained in the last exhibition. He has a very elegant subject in the great room, entitled "Odalisque." It is an Oriental female leaning over a swan. The figure is very graceful, and the swan's feathers, which are erected, are, as examples of facile and certain execution, masterpieces of art. The only objection we have to the arrangement is, that the figure being in a white dress, the dark shawl round her waist combining with the fan made of peacock's feathers divides the subject, including the swan, into two equal masses of white, which effect is rather enforced than relieved by the dark trees in the background, because they add two dark masses to the two light masses—certainly not a very artistic arrangement; but, setting aside that technical oversight, it is a picture of ideality and sentiment. One of his other pictures, "The Star of Bethlehem," although elegantly composed we do not like so well. The lines of the drapery are too like the flat and edgy folds of the Elgin marbles having sameness in touch, although well varied in form. Near to this hangs a fine picture by Hubert; it is an extensive landscape and cornfield. The title of it is "To labour is to pray." If the artist has not thrown over it a "dim religious light," he has given it an atmosphere of that softness and balmy repose calculated to excite the religious sentiment. It repre-

sents the monks of St. Bernard's Abbey, Leicestershire, gathering the harvest of 1861; the boys in the adjoining field are from the reformatory, under the care of these religious people. It is, although minute in treatment for its size, painted with the feeling of an artist.

We must congratulate Mr. Cope on an improvement in his style of pencilling, for he has quitted that coarse, unfeeling, and absurd method which belonged to the pre-Raffaellite fashion, for a much more legitimate style; although, in minor parts, it may be still discovered in his picture of "Two Mothers," furnishing as many compartments in one frame. The subject is, or the subjects are, taken from Proverbs xxxi. The one mother "looketh well to the ways of her household. Her children arise up and call her blessed." The other is a contrast to this; she is idle, handsome, and vain, caring little for her children, while the occupant of the other division of the picture is teaching her children, while she herself plies her needle. The colouring is more rich and harmonious than we have seen by this artist for some years. We must not forget a fine picture by Frederic Goodall. To think that such a painter as this should have no more academic distinction after his name than Mr. Millais has! They may be both Associates of the Royal Academy, but they cannot associate as artists in the interchange of painter-like thoughts and feelings—supposing them equally honest in their practice. However, the title of Mr. Goodall's picture is "The Return of a Pilgrim from Mecca; his Purse-bearer distributing Alms to the Poor of Cairo." The subject is taken from Lane's Modern Egyptians. The picture has scarcely a sufficient general interest to induce an appreciation of the labour, skill, and character which it represents; but the effect is fine, the execution admirable, and the story, such as it is, well told.

There is some merit due to the Academicians for having accepted and hung a picture by Mr. Lawless, of "The Widow Hogarth selling her Husband's Engravings." It is very well painted; but it appears she was, twenty years after his death, totally destitute, and it was not until the King, George III., recommended the Council of the Academy to do something for her that they voted her the liberal allowance of £40 a year. How much does the public know of half their works, and who does not know Hogarth's? See the groups before them at the International Exhibition. What a pity it is that fame so frequently does not come until remuneration is too late. "The Searching for the Will" is a picture, if it had been painted and exhibited when Wilkie's domestic subjects had possession of the town and excited general interest, would have made the fortune of the painter; but, as it is, it scarcely attracts the attention it deserves. It is, however, a very clever composition, and the story is remarkably well told. The cool determination and defiance in the countenance of the scapegrace son, just arrived, standing with his back to the fire, having no other sign of mourning than a piece of crape round his hat. In the centre is a group of relatives and friends, anxiously searching in a chest of papers for the will; from amongst these persons the widow looks at her cool, obdurate, and unfeeling son, and, as a point of composition, connects him with their proceedings. The rest of this excellent picture is filled up with visitors, who by gestures express their doubts and fears of the result. In the same room is a large and well-studied picture representing the painful scene of women, friends, and children, assembled round a pit's mouth after an explosion in the mine below. The incidents here represented are so natural that it would seem greatly, if not entirely, taken from the reality. The title of "Unaccredited Heroes" alludes to the man whose wife is taking leave of him, about to descend to assist the unfortunates underground, and to others who are exerting themselves in various ways. There is a great deal of vigorous and appropriate execution in this work, but the artist has been rather over zealous in painting a little girl seated on the ground playing with some pieces of coal, with which she has blacked her face. It is too serious a subject for excesses of that kind, which tend to produce a comic effect, entirely out of place, and is one of those straining for effect, forcing of ideas, and hatching of puerile conceits, which we have in these columns so frequently and, as we believe, so justly censured. If Mr. Bardwell, the painter of this picture, will keep to the first general idea, and do nothing but support that, he may attain a good position in art.

There are a great many pictures deserving of notice to which we may return, but the sculpture, beyond several good busts, is not so good as last year in important subjects.

LONDON PAINTERS' MEMORIAL.

THE following memorial, unanimously agreed to at a public meeting called by the Amalgamated Association on behalf of the Painters of London, has been sent to the employers of painters in London:—

Your memorialists have long felt the grievance of not being paid the same rate of wages as the skilled workmen in the other branches of the building trade. Whilst admitting he skill required for them to execute their work, we also claim acknowledgment for the skill required so to apply colour for decorative purposes that it will obtain the expression of satisfaction for the whole of the work when completed.
